"There is one Art," to be reached or not reached by one road. The method, the means, the plan of the rightly-constructed book are the exact opposite of an example of this class. First comes the idea, the essence, the plot, be that what it may—the inevitable development (not the portrait), not of individuals, but of types. Next comes the grouping, the scenery, the successive presentations of the march of types. Lastly, the artist, as he is bound to do, looks about him for models from which to draw his type, and when he has found them he draws from them. Every step is vital and essential, the order in which the steps are taken is even more vital still. The construction inevitably consists of three factors: the idea, the grouping, the models to make the type, whereas in the typical English mode the idea is usually left out altogether, the two other factors are taken in the wrong order, and for types are substituted individuals.

AN ENGLISH VIEW OF AMERICAN LIFE.

Mr. A. S. Northcote writes pleasantly on "American Life through English Spectacles." He notices the repugnance of Americans to country life as we understand it in England, and comments upon the substitutes which the Americans have invented for their charm of rural life. Mr. Northcote says:—

American daily life and intercourse is more formal than English. The taste for simplicity is growing, I hope and believe, throughout America. In every city the fops to display are gaining in numbers, and the vulgar ostentation which some years back so many foreign writers attributed to almost every American is fast dying away.

The sanguineness of the American is another feature especially striking to an outsider. The whole temper of the people is one of hope.

Of one thing, however, the American as a whole (I except the New Englander) is incapable. He cannot save. The creed of thrift of the German farmer or the French peasant is without a follower among city-inhabiting Americans.

The Rede Lecture, by Professor Michael Foster, on "Weariness," is very interesting reading. Mr. Foster describes the physical phenomena which accompany and cause weariness. He says:—

In every tiny block of muscle there is a part which is really alive, there are parts which are becoming alive, there are parts which have been alive but are now dying or dead; there is an upward rush from the lifeless to the living, a downward rush from the living to the dead. This is always going on, whether the muscle be quiet and at rest, or whether it be active and moving. . . . The failure in power which follows action, and which we call weariness, is due not only to the too rapid expenditure of capital, but to the clogging of the machinery with the very products of the activity. And indeed there are many reasons for thinking that this latter cause of weariness is at least as potent as the former. The sound way to extend the limits of activity is not so much by rendering the brain more agile as by encouraging the humbler helpmates so that their more efficient co-operation may defer the onset of weariness.

STUDY AND THE STAGE.

Mr. Hamilton Aidé protests against the new stage doctrine which has found favour with some people latterly as to there being no necessity for study in an actor's calling. This, he thinks, is a most mischievous theory, and especially mischievous just now, when there is a great revival of the British drama.

Never, perhaps, has the stage, at home and abroad, been as much discussed in England as during the past six months. New ground has been broken, new ideas have taken a certain hold of the public mind; a revolution against restrictions of subject, of treatment, and even of exposition, has broken out; an endeavour to sweep away the old barriers has been met with vigorous resistance, if not with uniform success.

THE MALAY PENINSULA.

Mr. Alfred Keyser explains for the benefit of those French people who have been lashing themselves into a rage that we should annex the Peninsula, that we have as good as done so already. He says:—

The Malay Peninsula is, then, a congeries of States, of which the only ones of any size or importance are Perak, Selangor, Pahang and Johore, all of them, with the exception of the last-named, directly administered by English officers, in the name of their several Sultans, and under the control of the Colonial Government at Singapore. Without any direct act of annexation, the British Government has made itself responsible for the administration of the greater portion of the Malay Peninsula, and to direct attention to the wealth, and at the same time to the wants, of the countries composed in that geographical expression.

THE FORTNIGHTLY REVIEW.

THE *Fortnightly* does not contain many papers of exceptional importance, with the exception of Mr. Grant Allen's denunciation of the Christian religion, which is noticed elsewhere. The first place in the magazine is given to Mr. W. H. Grenfell's reply to Mr. Gladstone's speech in defence of Mono-Metallism.

THE ORIGIN OF CRIME.

Mr. W. Bevan Lewis, in an elaborate statistical paper stuffed full of figures, discusses the question as to how far crime is the direct product of alcoholism. His more important conclusions are thus expressed:—

Insanity (simple) is probably the result of very complex social factors, not so intimately due to the direct agency of alcoholic excess as is the case with criminal degeneracy.

Alcoholism, on the other hand, tends towards the production of epilepsy and the *epileptoid* states in the offspring, and when indulged in to excess by this degenerate progeny tends to issue in the convulsive forms of insanity so often associated with criminal propensities.

A large proportion of criminals show *epileptoid* features, and are to be regarded probably as the degenerate relics of an ancestry who have passed through the more acute stages of mental derangement.

A large amount of juvenile depravity may be distinctly traced to these epileptoid states inherited from an alcoholic or neurotic parentage.

THE CLIMBING OF HIGH MOUNTAINS.

Mr. W. M. Conway, the mountaineer, who has beaten the record in the Himalayas, describes the training and precautions necessary to reach the highest heights. The Alps, he thinks, have ceased to be a training school for climbers. Their places are taken by the Caucasus, but the passion for climbing, instead of declining, tends ever to increase. He describes his own experiences in the Himalayas, and sets forth the precautions necessary to break his record. He says:—

With such precautions, I think, it may be possible in the Karakoram to reach an altitude of 24,000 feet. I do not prophesy that greater heights will not be attained, but I hardly expect that they will be.

THE MILITARY AND THE MAGISTRATES.

Mr. George Irving discusses the vexed question as to how far it is right to allow our soldiers to be left at the mercy of coroners' juries when they are called out to suppress a riot by the magistrates.

The reform needed is a simple one. In France an officer when requisitioned is told by the civil authority the end to be attained, and then allowed to use whatever means he deems necessary to attain it. If our Parliament could find time to embody some such rule in an Act, and give an officer complete authority as well as responsibility, or, what would be less advantageous, leave both authority and responsibility solely in the hands of the magistrate, there would be an end both of a long-standing unfairness to officers, soldiers, and magistrates, and of senseless questions in the House of Commons, on one subject at all events.

ATHLETICS IN AMERICA.

Mr. Caspar W. Whitney, in a paper on the "Development of Athletics in the United States," tells a very interesting story of the extent to which athleticism has developed within the last twenty-five years. In lawn tennis and in cricket the Americans cannot come up to the English, but in nearly all other branches of athletics American athletes lead the world. In running, the Americans beat us at distances under a mile; over a mile we beat them. Professional sport in America is dead, with the exception of racing. Football has taken the place of baseball in the United States.

OTHER ARTICLES.

Mr. Cope Whitehouse discusses "England's right to the Suez Shares," in order to suggest that, considering what we have paid, we have no right to a property which is now valued at £20,000,000 sterling. Mr. Edward Dowden sends some interesting extracts from the autobiography of a loyal Irishman who served as a Volunteer in Germany during the Seven Years' War, and lived on into the beginning of the present century. Major Martin Hume describes the historical associations that cling round about Durham Place, which stood in the Strand, close to the site of the Adelphi Theatre. Mr. A. D. Vandam draws a parallel between France in 1793 and 1893, and Mr. J. T. Bent tells us all about those portions of the Persian Gulf which are under British protection.

CONTEMPORARY REVIEW.

The *Contemporary Review* is a good number, and I notice elsewhere two or three of the more important articles.

PROFESSOR WEISMANN ON NATURAL SELECTION.

The first place is given to a very long paper, in which Professor Weismann replies to Herbert Spencer. Its nature might be adequately indicated by its title: "The All-Sufficiency of Natural Selection." He thus sums up the conclusions at which he has arrived:—

I hold it to be demonstrated that all hereditary adaptation rests on natural selection, and that natural selection is the one great principle that enables organisms to conform, to a certain high degree, to their varying conditions, by constructing new adaptations out of old ones. It is not merely an accessory principle, which only comes into operation when the assumed transmission of functional variations fail; but it is the chief principle in the variation of organisms, and compared to it, the primary variation which is due to the direct action of external influences on the germ-plasm, is of very secondary importance.

THE PRINCIPLES OF THE REFORMATION.

Archdeacon Farrar replies to Canon Knox Little in an article which is too much of a detailed problem to be capable of being summarised here. The following passage explaining Archdeacon Farrar's personal position may be quoted:—

In default of other defenders better qualified, I have tried to defend what I believe to be—and have from early boyhood been taught by High Churchmen themselves to be—the doctrines of the Church of which I am one of the least worthy ministers. If she taught the doctrines of Sacerdotalism, of Transubstantiation (or anything at all akin to it), of unconditional priestly absolution, and of the duty of auricular confession, I for one would leave her communion to-morrow, and, in leaving it, would shake the dust from off my feet. I am convinced that so far from holding these doctrines, she has done her utmost to repudiate them. In maintaining what I believe to be her principles, which I only do because I am constrained to do so by an overwhelming sense of duty, I have not consciously overstepped the limits of justifiable earnestness.

MR. ANDREW LANG ON PSYCHICAL RESEARCH.

Mr. Andrew Lang has, for some time past, paid considerable attention to the phenomena of "Borderland," and we have one result of his studies in a paper entitled "Comparative Psychical Research." That which strikes Mr. Lang is the curious similarity of character in almost all the stories of psychical manifestation. It is evident that Mr. Andrew Lang finds the evidence too strong to be resisted, as, indeed, every one must who pays serious attention to the subject. Similarity of the phenomena compels him to the conclusion that the psychological conditions which begat the ancient narrative produce the new legends:—

These surprise us by the apparent good faith in marvel and myth of many otherwise credible narrators, and by the coincidence, accidental or designed, with old stories not generally familiar to the modern public.

"EVOLUTION A NOTE OF CHRISTIANITY."

This is the title of an article by Miss E. M. Caillard which may be read as a pendant to Mr. Grant Allen's article in the *Fortnightly Review* on "Immortality and Resurrection." Miss Caillard accepts the origin of Christianity and its capacity to survive as suggesting on Darwinian principles the marvellous, not to say miraculous, capacity. She says:—

A religion which could wake an answering response in Jew, Greek, and Roman, despite their widely different mental and moral constitution, a religion which could satisfy alike the

demands of the most exalted philosophy and the humble requirements of slave and peasant, showed from the first a vital power comparable to nothing that had gone before it. Even the tide of corruption and debasement, with which its apparent triumph threatened to overwhelm it, was powerless to effect more than a fresh and astounding proof of its vigorous life. We shall look in vain for a parallel to this in the history of any other religion; the doctrine of the "survival of the fittest" has never had a more striking illustration. Nor does the lesson stop here, for as every change of environment called for fresh adaptation, it brought into action new and unsuspected powers of organic development. A pause in one direction meant an advance in another.

THE TEACHINGS OF THE LABOUR COMMISSION.

Miss Leppington, writing on "The Teachings of the Labour Commission," summarises the evidence from her own point of view. She says the evidence dispels the fallacious assumption that the labour interest is one solid phalanx, representing a united front to the outside world. The masters are divided into three grades, according to the attitude they assume towards the Trades Unions. A few are amicable, many are passive, but most of those who are face to face with the new Unionism are hostile. She thinks the moral is that, instead of centring all effort upon realising some one scheme, we should rather endeavour to ensure to each scheme an open field, where it may work out its own development unhindered. The one practical suggestion she makes is that an agricultural labour colony shall be established as a promising experiment, which can hardly fail but to yield useful lessons to all concerned.

OTHER ARTICLES.

Professor J. Shield Nicholson, writing upon "The Indian Currency Experiment," consoles us by saying that as soon as the full effect on trade has been felt, exchange will be for a time worse than before. Mr. Phil Robinson discourses on the "Sunshine and Rain" of this remarkable year. Mr. Hamerton writes upon "The Foundations of Art Criticism," and generally defends Mr. Ruskin against the attacks of the new critics.

THE NEW REVIEW.

I NOTICE elsewhere Mr. F. Impey's paper on "Lord Tollamache," and the Head Master of Harrow's on "Our Public Schools."

THE COAL WAR.

Mr. Samuel Woods writes an article which will be read by many friends of the miners with sincere regret. He declares that arbitration in wage disputes is a piece of obsolete machinery which may be placed on the scrap board. Mr. Woods thinks that any man must be either grossly ignorant, devoid of experience, or partial to the coalowners, who concludes that the present dispute can be settled by arbitration. In his judgment, conciliation and not arbitration is the only means of settling a dispute between labour and capital. But, surely, the proper thing to do is a combination of both. The Board of Conciliation and Arbitration in the finished iron trade offers the best method of how to combine the two principles. The Board of Conciliation fights down the points of difference to the irreducible minimum, which is then left to an arbitrator to decide. The alternative is a strike, in which, as experience proves, the workman, as often as not, gets the worst of it.

THE OPERA IN ENGLAND.

Playgoers and musicians will turn with interest to the notes and reminiscences of Sir Augustus Harris, who has not hitherto indulged much in autobiographical articles in the monthly Reviews. Sir Augustus Harris

says that where other men keep their yachts, he keeps an opera house, and he gets quite as much out of his baritones and sopranos as others do from their grouse and partridges. The result of his experience is to convince him that, if you scratch a singer you will find a shopman, and that the least competent the aspirant the greater his pretensions. It seems that he lost from £14,000 to £16,000 in one of his Drury Lane opera seasons in 1887. After that he decided to have nothing whatever to do with operas, and he would have been as good as his vow if it had not been that Sir Charles Beresford formed a committee to get half the boxes subscribed for in advance. As a result he has Covent Garden and Drury Lane upon his shoulders.

THE BOMBAY RIOTS.

Sir William Wedderburn, writing on the "Bombay Riots," suggests that the persons to be blamed are neither the Mussulmans nor the Hindoos, but the British Government which prevented them from cutting their throats. The Government of Lord Harris, he says, is not in touch with the people, or with their leaders. The attitude of the Government towards the Congress Movement and the natives generally is unsympathetic, and instead of composing the strife of races and religions, the Government is acting upon the principle of dividing, in order that it may govern. The moral of the Bombay riots, in fact, according to Sir William Wedderburn, is that we should back up the Congress Movement.

OTHER ARTICLES.

There is a very powerful but somewhat disagreeable story, entitled "A Last Scene," by Alfild Agrell. Mr. Edmund Gosse discourses on the poetry of John Donne. Mr. St. John Hope tells the story of "Silchester," the buried Roman City which is being excavated near Reading. Mr. Albert D. Vandam continues his papers on the "Comédie Française." Mr. Rennell Rodd describes his visit to the Monasteries of Crete.

THE NATIONAL REVIEW.

THE *National Review* has changed hands. It is now owned by Mr. Maxse, the son of Admiral Maxse, and will be edited by its proprietor, and conducted on the same principles as hitherto, with a difference. It will be as staunchly Unionist as ever, but judging from the present number it will be more of Mr. Chamberlain's type than of Mr. Balfour's. Admiral Maxse's article upon "Judas" I notice elsewhere.

THE BEHRING SEA AWARD.

Mr. A. W. Staveley Hill, M.P., does not like the Behring Sea Award, and for the following reasons:—

While the Regulations do not in any way regulate the killing on the islands, they interfere with and injuriously affect the ocean sealers, but only to a very small extent protect the seal: they seem to justify the criticism that, whilst it was impossible to have selected a more competent tribunal to deal with grave questions of international law, the work of regulating the sealing industry itself would have been more fully placed in the hands of practical men, who might have greater opportunity of arriving at a fair conclusion as to the best mode of dealing with such matters.

THE TUSCAN NATIONALITY.

Mr. Grant Allen has a paper on the "Tuscan Nationality," the point of which is to insist upon—the cardinal importance of the Etruscan blood in the secular development of Italian art and Italian civilisation.

He concludes his paper with the following remarks:—

Is it not a curious refutation of certain modern theories as to the innate superiority of the Aryan race (whatever that may

mean) that the one people in Italy who have thus practically shown themselves most receptive of Hellenic and Semitic civilization should turn out to be the people most universally admitted, alike on linguistic and ethnographic grounds, as of antique non-Aryan or pre-Aryan origin?

THE CRIME OF 1867.

Mr. H. R. Traill is very much disgusted with the British elector. Because that individual is not foaming at the mouth over the iniquities of Mr. Gladstone, he thinks that he has lost all sense of patriotism, and, of course, it is all the fault of Disraeli for enfranchising the British householder:—

But the prospect is not hopeful. Twenty-six years have passed since the crime of 1867, and the political unfitness of the electorate that created it has only now been fully demonstrated. It would almost seem as if the British elector has delayed to demonstrate it thus fully until he could do so with all the dramatic effect of irreparable disaster.

A WARNING FROM WALES.

Mr. A. Griffith-Boscawen, M.P., is scared at the prospect of a Welsh Nationalist Movement. Some men are born timid, but an Englishman must be crossed with a rabbit before he is frightened of Wales. Mr. Boscawen, however, is very timorous. He says:—

The leaders of Welsh Radicalism, firmly intrenched in the County Councils, flattered by Mr Gladstone's mischievous allusions to Welsh Nationality, and aided everywhere by the political Dissenting preachers, are determined to take the law into their own hands, and to have done with England and everything English; and if England does not wish to have a second Ireland in Wales she must look to it, and look to it soon.

AN ENGLISHWOMAN IN THIBET.

Miss A. R. Taylor is a better traveller than she is a writer. This is the good lady who last winter made a seven months' journey from the Chinese town of Tau-chau, in the Province of Kan-sub, to the interior of Thibet. She got back alive, but although she accomplished more than any man ever accomplished in penetrating into an almost inaccessible region, she is disqualified by the mere fact of her sex from being a Fellow of the Royal Geographical Society, a distinction which is conferred without hesitation upon any number of stay-at-home travellers who happen to be born male.

OTHER ARTICLES.

Mr. Frederick Greenwood has a curious story entitled "Young Genius." The Hon. Evelyn Hubbard, writing on the "Rupee Difficulty," says:—

The closure of the Mints, with all its risks, may prove a less evil than the imposition of additional taxation, while inaction is practically synonymous with bankruptcy. The Government of India stood between the devil and the deep sea, and small blame to it for seizing the first practicable means of escape.

Mr. W. Earl Hodgson writes on the "Immorality of Evolutionary Ethics."

The Lyceum.

THE *Lyceum* for August contains an article on the "Civilisation of Africa," which is a rather severe review of Dr. Molony's book, "With Captain Stairs to Katango." The same number also reviews Mr. C. H. Pearson's "National Life and Character," and calls attention to "Three Women Poets"; Miss Dora Sigerson, Mrs. Sarah Piatt, and Miss Madeleine Barrie.

THE NORTH AMERICAN REVIEW.

THE *North American Review* for August is a good number. I notice elsewhere Mr. Goldwin Smith's article in reply to Mr. Carnegie.

THE MEANING OF THE GERMAN ELECTIONS.

Dr. J. H. Sanner, writing on "The Issue of the German Elections," takes the somewhat paradoxical view that the appeal to the country which has resulted in carrying a measure on which the Emperor had set his heart was a defeat for the monarchy:—

The rulers of the New Era have ignominiously lost this battle. The defeat of the Emperor's *voluntas* is the one overshadowing result of the recent German elections. It marks an important phase, possibly the turning point, of the great struggle of the German nation for real constitutional government. The apparent annihilation of the *Reichsritter*, the dismal failure of the government to disrupt the mighty party of the Centre, the growth of socialistic and anti-semitic votes, the strength developed by the Poles, the weakness of the Alsatian protest party, the defeat of the free-traders and the increasing contrast between North and South Germany, all these and other favourite topics of the daily press are simply products of temporary coincidences. The effects will not last long. But the victory of the people's right to assert their will in the policy of the government will and cannot fail to impress the future development of the German nation.

AN ANGLO-RUSSIAN ALLIANCE.

Mr. W. Selbie, in a short paper entitled "Our Coming Rival," directs the attention of his countrymen to the possibility of England coming to terms with Russia in order to develop Western Asia. He says:—

Our present attitude on the tariff question should rub the scales from their eyes and should develop an English statesman able to look at things as they are, and not as he has them pictured from the traditions and prejudices of his fathers, and he should say to Russia: "You take Constantinople and Persia; we will keep Egypt and India. We will furnish capital to build your railroads and open up your wheat and oil fields. We will take your produce and give you our manufactures in exchange." That would, indeed, be a great combination, and it would soon embrace more than these two nations. England could make no better bargain than this. She would be in no wise injured by giving Russia what she wanted, and with Russia as her ally would possess her own Oriental realms in peace and quiet. Russia having secured the needed outlets, and having secured a large infusion of English blood, brains, and money, would surprise the world with her wonderful growth and output. This would be stealing our thunder and improving on our special patent "reciprocity," but who shall say that we may not see this thing done? If it is, the future for our farmer is worse than the present.

POSSIBILITIES OF PRAYER.

There is a very curious article by Mr. E. S. Martin under the above head. Mr. Martin has got the idea that prayer may be used scientifically. He says:—

The more rational idea of prayer would seem to be not an argument or entreaty which influences the sentiments of the Deity, but a force which acts directly on some force which is included in God. Of prayer so considered it is as obvious a necessity that the results it seeks should accord with God's will as that the results expected from the control of other natural forces should accord with the laws of nature. Man is not the supreme force of the universe; but he is akin to it. He shares its quality. All things are possible to him if only he can learn how. If he can ever become the reverent master of scientific prayer we may expect to see the rate of his progress indefinitely accelerated. The incurable will be cured then; the impracticable will be done; the secret of perpetual motion will be revealed; the fountain of youth will gush out. The millennium will have come then, but only for those who have learned to know it.

THE HOUSE OF LORDS.

Mr. Justin McCarthy writes strongly on what he calls the "Useless House of Lords." He says:—

I see no countervailing advantage to the country in the existence of the House of Lords. Admitting all the defects, are there actually no advantages? I only give my own opinion, and I say, No—none whatever. I am not now discussing the wider question as to the value of a second chamber in the legislation of a state. I am thinking merely of the House of Lords in its present form, or in any form like to that; and I can only say that I see in its existence much evil to the national interests and no good: no—none whatever.

THE FRENCH PEASANTRY.

The Marquis de San Carlos describes the French peasantry in a brightly-written paper, which concludes as follows:—

It is a sad truth that the French peasant is changing into a hardened materialist. And it is by no means the Catholic cause I undertake to advocate. It is that of religion in the widest acceptance of the word. The Frenchman who gives up the faith of his fathers forfeits all faith, and consequently all moral restraint. It would be preferable to see him kneeling down every morning in the midst of his wheat fields to adore the rising sun, or stealing into the dark oak forest to worship the pale sweet goddess of the night—believing in something, if naught but the immortality of his own soul—rather than to find him a prey to the hard egotism which is dragging him down to the earth that has borne him, without consolation in sorrow or hope for the future.

THE AMERICAN HOTEL OF TO-DAY.

Mr. W. J. Fanning praises up the American hotel. He says:—

The consensus of opinion expressed by unbiassed travellers, both European and American, is clearly in favour of the American hotel, taken as a whole. In its appointments it is far in advance of the hotels of Europe.

On the other hand, General R. C. Hawkins denounces it for its manifold imperfections. He quotes the opinion of a Roman innkeeper, who asserted that—

a good bed, good soups, good bread and good tea and coffee, were the foundations for an acceptable hotel, and he was right. As a rule, the American hotel is a failure in respect to all of these essentials. It is quite unnecessary to write that not one in ten of those products of the kitchen named in the bill of fare are properly prepared or decently served. The vegetables are usually cold and soggy, often slopped with a nasty-looking and worse-tasting sauce; the joints are usually tough and cold; the flesh made dishes (*entrées*), with high sounding French names, neither taste nor smell like anything we have ever seen before; the sweets are often the better part of the dinner; but the fruits, in the majority of instances, are the cheapest and poorest that can be found.

HOW CHOLERA CAN BE STAMPED OUT.

Dr. Ernest Hart publishes an elaborate paper, in which he communicates the mass of evidence that he has accumulated in order to prove that—

water is the chief if not—in Europe—the sole agency in the spread of epidemic cholera. With the scourge close at our gates let me urge upon every community and every responsible authority in America to profit by these lessons before it is too late; to put their houses in order and secure purity of water especially, but also of soil, of air, of habits. This is the best, the only successful, weapon wherewith to protect ourselves against cholera. Quarantine is a sieve rather than a protective armour.

AN AMERICAN VIEW OF THE "VICTORIA" DISASTER.

The Assistant-Secretary of the American navy thus draws the moral from the loss of the *Victoria*:—

There are two lessons, however, which it seems to me we can learn with great profit in this country from the late

disaster. The first is the necessity for squadron drills and the practical manœuvring of fleets. There is no amount of theoretical learning which will give the same results as this experience for fleet drill, as it is the only practical way to acquire great skill and ability to handle ships in time of action, and is, moreover, the surest method of acquiring precision in that most important of things in the navy—the art of signalling. This leads to the second and greatest consideration—the importance of the personnel. With all his learning, persistence, skill, and experience, with all the secrets he has wrenched from Nature and learned from art, man has as yet made no machine superior to himself. To spread the light, to promote union, and to perfect its own organisation is now the object and the duty of the Prohibition party.

DISEASE AND DEATH ON THE STAGE.

Dr. Edson writes an article, the gist of which is that actors, as a rule, never die on the stage as people die in real life; or rather in real death. He points out, however, that they cannot die naturally without either revolting or boring the house. It would certainly be better that they should continue to die stagily than that they should take the means of one eminent actress in order to be true to life, or, rather, true to death:—

Mlle. Croisette, in Paris, when playing in "La Sphynx," created a great sensation and made a great name for herself. She went to Dr. Charcot, the eminent physician of Paris, and, learning from him the effects of poisons, chose strychnine and had the name inserted in the play. She studied carefully all that books could tell her, and then procured several dogs and gave them the poison, watching the spasms which followed. She produced such a perfect simulation of the results following the swallowing of strychnine that, not only did the daily press praise her, but one of the medical journals devoted quite a long article to this part of the play, and advised medical students to go to the theatre for the purpose of studying the symptoms of poisoning by strychnine. For one Croisette that you will find on the stage, however, you will easily see a hundred victims of poison who simply cause the physician to smile.

SOCIAL ARISTOCRACY.

A book has just been published at Berlin bearing the title of "Volksdienst" (People's Service), by a Social Aristocrat. According to Herr Bruno Wille, who writes in the *Freie Bühne* for August, it is a book full of individual observation and new thoughts.

The "Social Aristocrat's" concluding words give some idea of the scope of his work:—

Till we have learnt that it is immoral to slaughter our best men in battle; to give money, power, and influence to the idler through hereditary wealth and title; to exclude woman in all positions from work; to marry for gain and not for love; to marry an unhealthy man and bring sickly children into the world; to make the people incapable of serious thought by religious delusions; to train up children for the past or for a hereafter instead of for the present; to submit to the right against moral conviction—till we have learnt all this, the greatest has not been done. But for those who have already attained this, it is time to assemble round the flag of the People's Service and the Social Aristocracy.

Though the Social Democratic Movement has rendered great service by waking up the ruling classes, the movement, says the "Social Aristocrat" is nevertheless becoming dangerous, and if a worthy programme of social reform does not soon appear, there is serious danger that many of their plans will be shattered, if only through the growth of their influence on legislation. He declares with Häckel that Darwinism does not lead to Socialism, but to a Social Aristocracy.

THE ARENA.

The Arena for August is hardly up to its usual mark. here are six more verdicts on the Bacon-Shakespeare case; five of them are in favour of Shakespeare. Professor A. E. Dolbear returns an open verdict, as he does not think that Shakespeare wrote the plays, but does not feel justified in deciding in favour of Bacon.

WELL-SPRINGS OF IMMORALITY.

Mr. Flower, the editor, has a paper in which he dwells upon the sources from which arise the immorality of the present day, and he concludes by suggesting the following threefold crusade:—

1. For a childhood resulting from an awakened conscience, be fruit of intelligence and love.
2. For absolute justice for woman—including full enjoyment of the right of franchise, an absolute and independent possession in the property interests of the home which results from her union, and the absolute right to her own body.
3. For a purer, simpler, and less sensuous and extravagant life, with a determined warfare on those things which stimulate passion and lower the moral ideal, chief among which are toxicants and opium.

Progress along these lines means development of the highest and best in manhood, and the enthronement of that spirituality which nourishes the soul of true civilisation.

PSYCHIC HEALING.

There are two papers upon this subject, one by Carol Norton on "The Office of the Ideal in Christianity." Mr. Norton says:—

Giving all power to spiritual thought and Divine Mind, above the immediate evidence of the personal senses, Christian Science succeeds where current theories, based upon the so-called laws of matter, utterly fail in their attempted reformation of human depravity. Christian Science recognises that the reformation of man, and the healing of disease, jointly demand that the mentality and not the physicality of man be dealt with; because of the fact that the thought germ of disease, as well as sin, exists in the human mind, and must there be annihilated.

Mr. J. L. Hasbronck, in a paper entitled "The Practical View of the Mind Cure," asserts:—

Numerous instances of insanity, of depraved appetite for spirituous liquors and morphine, and of other cases usually considered beyond the reach of an ordinary physician, yield, often readily, to this method of treatment. A poor girl, whose bondage to eczema rendered her life one of unhappy exile, is to-day a happy, smooth-faced child.

THE CURE FOR DIPSO MANIA.

Dr. Keeley, in reply to Dr. Evans, asserts once more that his Gold Cure is the real, genuine, and unmistakable remedy for inebriety. He says:—

The cure of inebriety by my remedy has cured one hundred and ten thousand insane people as well—except in the alleged eighty-eight cases, more or less, given by Dr. Evans, as reported by asylum superintendents. I am entirely satisfied with the result. The world will be so too. I trust Dr. Evans can so far divest himself of his insane prejudices as to join in the general satisfaction.

USURY.

Mr. J. G. Clark, writing on "Our Industrial Village," asserts that usury—

is the most gigantic, destructive, and terrible crime of civilisation. Usury is cannibalism, civilised and Christianised. It formerly captured, fattened, killed, roasted, and ate the body of its enemy. Now the same spirit inspires a man who captures

his friend and fellow-Christian, robs him of the only available means of getting fat, starves him in filthy garret and tenement cells till his last penny is gone, and then kicks him into the street.

There are the inevitable two silver papers, and an article by the Rev. Henry Frank, which I notice under the *Chronicles of the Civic Church*.

THE FORUM.

The Forum contains several articles which are noticed elsewhere.

THE BIG GAME OF AMERICA.

Mr. Theodore Roosevelt, writing on "The Big Game Disappearing in the West," gives an interesting but somewhat melancholy account of the devastation which the rifle-bearing hunter has wrought in the immense herds of big game which used to people the Western Plains. Very soon there will not be a single head of big game left unless some vigorous measures are taken to prevent their extermination. Mr. Roosevelt has his own proposals, which are thus expressed:—

We need, in the interest of the community at large, a rigid system of game laws rigidly enforced, and it is not only admissible, but one may almost say necessary, to establish, under the control of the State, great national forest reserves, which shall also be breeding grounds and nurseries for wild game; though I should much regret to see grow up in this country a system of large private game preserves kept for the enjoyment of the very rich.

HOW DR. EBERS'S CHARACTER WAS FORMED.

The well-known German Egyptologist and novelist, Dr. George Ebers, tells, in a few pages, how his character was formed. It seems to have been the product chiefly of his mother's teachings and the influence of a protracted illness which doomed him to solitude:—

Like a teacher earnestly instructing, many a fervent mother, even though limited in her nature, develops into an excellent educator; and among such my own mother was worthy to be classed with the best, wisest, and most truly beautiful. Few, I believe, individually appreciate the enormous hidden force in educational and moral influence exerted upon them by their mothers. When one leaves the motherly influence, one is already a moral man, or one is not; and of a hundred who are so, ninety-nine, even though unconsciously, are indebted to the mother. Personally, I am indebted for my full fruition, rounded out by a mother's influence, to the solitary contemplations which marked the saddest period of my life.

OTHER ARTICLES.

Mr. E. S. Holder, director of the Lick Observatory, sets down—

soberly, modestly, and in the briefest way, a summary of the achievements of American astronomy, and I have barely indicated the course of its development. It is a record of which any country might well be proud.

Dr. J. S. Billings, in a paper on "The Municipal Sanitation in Washington and Baltimore," gives a terrible account of the mortality among the negro children. Mr. F. R. Stockton eulogises Mark Twain for his recent works. Professor Angelo Heilprin casts a leisurely glance over the unexplored world, from which it would seem that there is sufficient territory left unexplored to keep geographers busy for some years to come. Mr. Horace White explains the result of the action of the Government of India on the Silver Question and the Sherman Law. Mr. Wolff points out the dangers that stand in the way of hasty tariff provision, and Mr. Leech, formerly director of the Mint, discourses on "The Doom of Silver."

THE REVUE DES DEUX MONDES.

THE most interesting article in the August *Revue des Deux Mondes* is M. Bazin's continuation of his account of "The Italians of To-Day."

THE FRENCH BAR.

In the same number M. de Mézérac contributes an article, interesting to all historical students, on "The French Bar During the Great Revolution." The writer, who has thoroughly studied his subject, is able to quote many hitherto unpublished documents which he discovered in the national archives, and has made use of several collections of memoirs written by both legal and civil spectators of the scenes and events he attempts to describe. Probably few are aware that one of the first actions of the Constitutional Assembly was to abolish the ancient Order of Barristers as it had been understood under the old *régime*. On the 16th December, 1790, it was declared that for the future every citizen might come and plead for the accused, and, it is hardly necessary to add, that every prisoner was henceforth to have the right of defending himself. Robespierre, points out M. de Mézérac, was one of the bitterest enemies of the Bar, and yet it has often been asserted that he did his best to preserve the old state of affairs intact.

But notwithstanding the fact that they could no longer claim special privileges and rights, the French men of law proved as tenacious as those of other countries, and immediately formed a kind of association, binding themselves to keep up all the old traditions and professional rules. Meanwhile, the amateur advocates had it all their own way, and some strange scenes took place in consequence. Although as members of the Free Bar they were supposed to give their services for nothing, abuses soon crept in; but it was not until December 14th, 1810, that Napoleon I. signed the decree reconstituting the French Bar on its old lines.

A PLEA FOR GAMBLING.

In an article on "Speculation and Banking Operations," M. R. G. Levy undertakes to prove that an element of speculation enters into all business and exercises human faculties in a perfectly legitimate manner. He quotes the Greek philosopher Thales, who on one occasion bought up all the olives of his district, his meteorological knowledge having warned him of a bad season. The olives went up, and Thales made money. Certain practical friends appear to have objected to monetary operations as being in themselves unfruitful. Thales laughed, and said that the learned man who could reason would come out with a profit. The morality of this answer not being in question, the reader is free to find a Greek "Corner" interesting as matter of history. The real gist of M. Levy's article is that the free play of human intellect on the value of a present or prospective bargain tends on the whole to reduce prices to an average, and to diminish the element of chance. He illustrates this opinion aptly by remarking that the French peasant sells his crops with far less risk of local cheating than he could were there no *Cours de la Halle*, meaning the market price of Paris.

FACTORY-MADE WINE.

The immense production of wine in France is a good reason why a special Congress called together at Montpellier, in June last, should have been exhaustively dealt with in the *Revue des Deux Mondes*. The purely agricultural discussion as to the method of replanting large areas where the vine has been destroyed by epidemic disease, is itself interesting. But to the general reader who possesses no vineyard and never saw one in his life,

the last pages of the article suggest reflections worthy of being retained. Supposing that healthy grapes are at last obtained, how is good wine to be insured? M. Antoine de Saportard's answer is prompt. The wine should not be made in a factory. Here, as in every branch of alimentatives, the tendency is for capitalists to buy up the raw material, and work it up. But grapes are delicate and difficult of transport, and the old-fashioned village wine-press, and the making of wine on the estates, large and small, where the grapes are grown—this "ancient French method" will alone keep up the old-fashioned reputation of Burgundy and Bordeaux.

R.I.P.

In the *Revue* of August 15th M. Du Bled continues his history of Franche-Comté, and describes at some length the popular traditions and legends of that province; he tells a quaint little story which the pious Comtois believe to be the origin of the words "requiescat in pace." It seems that there lived a certain knight, Peter de Ray, who was saved from hell by his pious wife, Quantine, but in order to work out her husband's salvation she had to survive him for three years. Having heard that in the long journey from the earth to heaven, souls who have just left the body are attacked by legions of devils, who try to drag them down, away from the angels who are bearing them up, she prayed constantly to her husband to keep as close as possible near the gate of Paradise, waiting so that when he heard her voice he might open it, and she might slip through the moment she arrived. Peter de Ray promised, and accordingly spent the three years with his ear on the right side of the door. When at last the lady arrived, she cried out, "Ray!" "Who is it?" he answered "Quantine." "Pass in," and the door was opened a tiny crack. Other souls who were waiting for St. Peter to come out with his keys, having seen Quantine slip through so easily, thought that they also would repeat the words, "Ray!" "Who is it?" "Quantine." "Pass in," and they also were admitted without any difficulty. This is why, that in their pious hope that they also will be able to essay the same dodge, they place R.I.P. as a reminder on tombstones. Franche-Comté does not seem to have escaped from a mediæval epidemic of sorcerers and witches; both in the fifteenth and even in the seventeenth centuries some 700 people were burned; and even to this day many strange customs form an integral part of life in the country districts of this little-known corner of France.

THE OYSTERS OF ARCACHON.

M. Foulet, describing an excursion he lately made through the valley of Arcachon, takes occasion to discuss pleasantly the beautiful old town which gives its name to the district, and the oyster-beds, the produce of which have been called before now the "French Whitstables." The reputation of the "Huîtres d'Arcachon" dates from the Romans, and the whole working population of that part of the world is given up to the culture of the precious mollusc. "A stranger in the district," observes M. Foulet, "seeing a troop of *parquers* walking near him would notice that each wore large red woollen trousers, and would consequently take them all for men; but supposing the group turns round and passes him, he will see that a number of them wear in addition, not only a short apron, which forms a kind of skirt, but also a hood, instead of a Tam-o'-Shanter; these are the women, who are quite as active and useful as their brothers and husbands, for the oyster requires constant care during the three years which must pass before it can be sent to the table of the gourmet."

THE NOUVELLE REVUE.

We have noticed elsewhere M. G. Lafargue's article on "the Regeneration of Children by the Sea," and Madame Scaris's account of the Evangelismos Hospital founded the Queen of Greece. Both numbers of the *Nouvelle revue*, although more Anglophobe than usual, are full of excellent reading.

MIRABEAU'S EARLY LIFE.

The place of honour in the August 1st number is given to a most extraordinary, hitherto unpublished document, written by Mirabeau at the age of twenty-seven, just after he had been arrested at Amsterdam, where the future Republican orator had taken refuge with Madame de Monnier, a lady known to his admirers as the Sophie who played so great a place in his existence. This strange chapter in Mirabeau's early life seems to have been till quite lately forgotten in the attic archives, for it was written and sent to the States-General in order that Holland might not give him up to the French authorities. Although the document is not like the defence he wrote of himself and of his conduct when imprisoned at Vincennes, the few informal pages cited by M. de Lomenie are infinitely more characteristic of the man, and give an instructive picture of Mirabeau's early life and surroundings.

FRENCH VIEWS OF ENGLISH AFFAIRS.

In the same number M. Saint-Saëns gives an amusing account of the conferring of Doctors' Degrees at Cambridge, contributing an amiable note of liking and respect for an English institution, which goes at least a little way to balance the anti-English articles which have been made a feature of the August *Nouvelles Revues*.

Baron de Ring and M. Z. Marcas both treat of the Eastern Question, the former by describing some of the late Egyptian judicial reforms, the latter by writing an elaborate review of Mr. Milner's "England in Egypt," which book, though he praises it highly as being honest and sincere in intention, he declares to have been obviously written from an English, and therefore partial, point of view. M. Marcas has called his article "Eastern Capitulations," and gives a lucid account of the relations of France and Egypt since the year 1517. It is needless to say that every line is written with a view to the evacuation of Egypt by the English, but the writer is to be congratulated on the tact and moderation with which he accomplishes his purpose.

OLD BERLIN.

M. Rambaud contributes two chapters of his account of the past relations of Russia and Germany; the nature of his articles can be gathered by their titles: "The Battle of Kunersdorf," and "The Russian Occupation of Berlin in 1760." The author has evidently studied the subject well, and in the following words he gives a curious account of Old Berlin:—

Berlin was at that time practically built on the two islands of the Spree; one of these islands was the Verolin, originally a small fishing-village; the other island was known as Collan, coming from the Slav word Kolin, which signifies a "hill." In 1452, Frederick with the Iron Teeth, Margrave of Brandenburg, founded a Burg, and round his feudal castle had gradually risen a capital. . . . These two islands, forming the town, were surrounded by bastions, to which the arms of the Spree served as moats. . . . Owing to the efforts of Frederick I., and somewhat to those of Frederick II., the town had become one of the intellectual centres of Germany, and was already known as "The Athens of the Spree." Lessing had made three long sojourns there, and only just missed the Russian Occupation; and Mendelssohn was the centre of a literary and philosophical society.

During the five years of the Russian Occupation Berlin was in a sad state, and M. Rambaud, notwithstanding his Russian sympathies, is obliged to admit that the conquerors behaved anything but well.

THE GENESIS OF KISSING.

Professor Lombroso, in the *Revue* of August 15, discusses somewhat learnedly the origin of kissing, which he declares was, till comparatively quite lately, an entirely maternal action, and not in any way peculiar to lovers. Homer, he points out, never mentions a kiss, except when speaking of the embrace of a father and son; Hector, in his scene with Andromache, does not kiss her, but squeezes her hand; neither do we find a kiss mentioned *à propos* of Venus and Mars, Ulysses and Calypso, or Ulysses and Circe. In the old Indian literature no mention is made of anything but the maternal embrace, but in the modern Hindu poems twelve kinds of kisses are registered.

OTHER ARTICLES.

In the same number M. Minegab describes, from the notes of an eye-witness, the Japanese Military Manœuvres which took place in September and October of last year, in the Province of Hiroshima. "The Japanese," he declares, "are not only an amiable and polite people, they are an intelligent and ambitious nation, who aspire to the commercial and political supremacy on the Pacific Ocean. We call Japan the 'France of Asia,' they call themselves the 'England of the East.'"

In his account of three Gallo-Roman towns, M. Cagnat gives the result of his researches at Nîmes, Vienne and Lyons, and in his article presents a very readable picture of Southern France as it was in the days of the Romans.

In the same number Mme. Shaw begins a series of articles on "The American-Indian Question," and describes the Oklahoma tribes at home.

In concluding his article on "Modern Sport," M. de Wailly declares that the French huntsman has but two enemies—the peasant, who does not like to see his land ridden over, and the State, which seems to do all it can to make the French forests and free lands dangerous to those who wish to cultivate "le sport."

NONSENSE.

In a short but violent article, contributed by Baron de Cambourg, and entitled "A Reply to the Insults and Threats of England," the following grave allegations are put forward: first, that England has a national guard but no army; secondly, that her numerous and powerful warships are both badly commanded and badly built; thirdly, that an invasion of England would be possible and even easy; fourthly, that her colonies and her maritime commerce, which is now spread over the whole face of the globe, render her ten times more vulnerable than France, did a combined action of the French and their allies ever take place; fifthly, that a simultaneous action of France, and Russia would provoke an instant and certain uprising in India; sixthly, that England's economic and financial power, already gravely menaced, would not resist the effects of a war, of which the least consequence would be a social revolution. "The duty of our parliaments, of our statesmen, and of our ambassadors," he concludes, "is to know how to resist England's exorbitant demands. If they accomplish their duty, perhaps Bismarck's famous prophecy, 'England will yet astonish the world by her cowardice,' will be realised to the letter." Madame Adam ought to have more regard for her friend than to allow such an article to appear in the pages of her *Revue*. It makes us laugh, no doubt; but editresses are unkind who make a laughing-stock of their friends.

SOME ILLUSTRATED MAGAZINES.

Harper's.

WITH the exception of "The General Election in England," there is nothing in *Harper* which calls for special mention. There is an interesting article upon E. S. Barnard and the Lick Observatory and "Texas as a State," which is selected for illustrated treatment, but the most copiously illustrated papers are those of "Down Love Lane," "In Old New York" (?), and Mrs. Pennell's paper on "An Albert Dürer Town." The paper on "The Riders of Egypt" includes riders of donkeys, horses, and camels.

The English Illustrated.

THE *English Illustrated* is going to be transferred to the *Illustrated London News* after the present number. The September number is very good. Besides those articles specially mentioned elsewhere, Mr. Henry Holiday discourses upon the barbarity of men's dress. Mr. Quiller Couch writes admiringly on "Living English Poets." The Hon. Robert Lyttelton describes "Cricket, Old and New." The Duchess of Rutland continues her account of "Belvoir Castle." The belated article upon the "North British Railway" is worked off at last.

The Century.

THE first place in the *Century* is given to Mr. A. Castaigne's "Sights at the Fair." His sketches of human types are quite wonderful. The travel papers describe Sicily on the slopes of Etna, and Miss Russell's experiences at the African diggings. Mrs. Oliphant tells the story of Daniel Defoe, and Mr. Bret Harte begins a tale founded apparently on his Glasgow experiences, entitled "The Heir of the McHulishes."

The Pall Mall Magazine.

THE *Pall Mall Magazine* is a wonderful shilling's worth. This month it has an admirably-executed coloured frontispiece of a Dutch peasant girl, from an original painting by Miss Cohen. "Sarah Grand" begins a new story, entitled "The Sere, the Yellow Leaf." Adalea, the real, although not the nominal, heroine is a reaction of decorum—an advanced young lady who wears short frocks, talks slang, pets a bull pup, and altogether promises extremely well. Hall Caine begins a series of "Scenes of Home Life in Poland and the Pale of Russian Jewry." Mrs. Parr continues her cruel papers on "The Follies of Fashion." The paper on "A Dutch Exterior," by W. L. Alden, has some passable illustrations, and several that are not worthy of the position they occupy. Robert Barr's story of the invention of "A New Explosive" is very clever and suggestive. Mrs. Lynn Linton discourses once more upon her ancient text in an article entitled "Society—The Remnant." Mrs. Lynn Linton should read the Book of Kings, and the story of Elijah. That good man, who was certainly a greater authority than Mrs. Lynn Linton can pretend to be, retired into a cave once, and waited that he alone was left to serve the true and living God; whereupon he was promptly told that there were in Israel 40,000 who had never bowed the knee to Baal. If Mrs. Lynn Linton's ears were as open to the celestial voices as Elijah's, she would have

received a similar message, and she would have spared us this wearisome iteration concerning blatant, noisy, unsexed, and wild women, few of whom are more blatant, noisy, unsexed and wild than Mrs. Lynn Linton herself.

Scribner.

THE best paper on Izaak Walton in the magazines is that which Mr. Alexander Cargill contributes to *Scribner*, which is copiously illustrated with pictures of Walton's country. Mr. Sullivan gives an account of the manuscript of Thackeray's which was found in Harvard College Library. Mr. Edward Lowell has a very interesting and well illustrated historical paper on "Clothes." Mr. Frederick J. Miller and Mr. Bacher illustrate a paper describing the work of a machinist, which is the fifth of the series on working-men's occupations. The literary paper is contributed by Mr. A. Dobson, who describes "Mr. Richardson at Home." The description of "The Tides of the Bay of Fundy," where there is a tidal rise and fall of seventy feet, is interesting. The poem on the "Harvest" by Mr. Scott is curious, and, in some passages, very striking.

McClure's Magazine.

DR. CONAN DOYLE tells the "Story of a Sea Fight." Mr. Blathwayt continues "Karl Hagenbeck's Adventures with Wild Beasts." General Adam Badeau contributes some "Personal Reminiscences of Edwin Booth." Miss Burnett writes, from the standpoint of a long-continued intimacy, a very appreciative account of "The Good Works of Mrs. Gladstone." After describing her many charities and public services, Miss Burnett says:—

As for the deeds of private kindness, it can truly be said that Mrs. Gladstone has sown them on all sides, and it is characteristic of that noble woman's nature that she is loyal to the last to those who need her help, even if it be for a lifetime.

I notice the account of the Boys' Camp on the Big Asquam Lake elsewhere.

Blackwood.

THE first article in *Blackwood* is an interesting account of "Glengarry and His Family: Some Reminiscences of a Highland Chief," based on the unpublished autobiography of Miss Macdonald, of Glengarry. I notice the interview with Father Ohrwalder elsewhere. The review of recent French novels is devoted to Bourget's "Cosmopolis," and Edouard Rod's "La Sacrifice," and Victor Cherbuliez's "Le Secret du Précepteur." F. R. Oliphant gives an account of "William Dunbar," which enables the ordinary English reader to form some idea of one of the earliest and greatest of Scotch poets, a kind of Scotch Chaucer. The writer of the article on the "Balance of Power in Eastern Asia" thinks that the military potentialities of the Chinese empire would make her more than a match for Russia if only she would not persist in reducing herself to helplessness. Yet Russia, as a practical question, has little reason to apprehend from China any serious resistance to her progress.

The Bookman.

THE *Bookman* publishes a portrait of Mrs. Kate Douglas Wiggin, whose "Birds' Christmas Carol" has a sale of 95,000 in the States. In England her most popular story is "Timothy's Quest." Mrs. Wiggin was born in Philadelphia, and founded the first free Kindergarten west of the Rocky Mountains.

THE CHRONICLES OF THE CIVIC CHURCH.

THE WORK OF THE CIVIC CHURCH. A PROGRAMME IN OUTLINE.

THE underlying idea of the Civic Church makes steady progress. At Lucerne in the early part of this month, and in Chicago at the Parliament of Religions, the proposal to constitute a new federative entity representing all the Churches, but primarily composed of those who were willing to take trouble and devote time to the welfare of their fellows, has been pressed upon the attention of representative assemblies. The following passages from the paper which I submitted to the Parliament of Religions at Chicago succinctly embody the general ideas of the movement which I have, in spite of many protests, named the Civic Church—believing as I do that Church is the right name for any association of men and women who labour to secure the salvation of the community in which they live.

WHAT IS THE CIVIC CHURCH?

The fundamental idea of the Civic Church is that of the intelligent and fraternal co-operation of all those who are in earnest about making men and things somewhat better than they are to-day. Men and things, individually and collectively, are far short of what they ought to be, and all those who, seeing this, are exerting themselves in order to make them better ought to be enrolled in the Civic Church. From the pale of its communion no man or woman is excluded because of speculative differences of opinion upon questions which do not affect practical co-operation. The world has to be saved, and the number of those who will exert themselves in the work of its salvation is not so great that we can afford to refuse the co-operation of any willing worker because he cannot pronounce our shibboleth. An atheist of the type say of Charles Bradlaugh would no more be excluded from the Civic Church because of his inability to reconcile reason and revelation than you would turn a red-haired man out of a lifeboat crew. For the basis of the fellowship of the members of the Civic Church is their willingness to serve their fellow-men, and he is the best Civic Churchman who devotes himself most loyally, most utterly, and most lovingly to work out the salvation of the whole community.

ITS RELATION TO OTHER CHURCHES.

Here let me at the very outset forestall one common misconception. There is nothing in the idea of the Civic Church that is hostile to the existence and prosperity of all the existing Churches. It presupposes the existence of such organisations, each of which is doing necessary work that is more efficiently done by small groups acting independently, than by a wider federation acting over a broader area. The idea of any antagonism between the Civic Church and the innumerable religious societies already existing is as absurd as the notion of an antagonism between the main drain of the city and the washhand basin of the individual citizen. The main drain is the necessary complement of the washhand basin, but its construction does not imply any slight upon the ancient and useful habit of each man washing his own face. He can do that best

himself, although the community as a whole has to help him to get rid of his dirty water. So for the salvation of the individual soul our existing Churches may be the best instrument, while for the redemption of the whole community the Civic Church is still indispensable.

ITS OBJECT.

What is the object of the Civic Church? The reconstitution of human society, so as to establish a state of things that will minimise evil and achieve the greatest possible good for the greatest possible number. What is the enemy that has to be overcome? The selfishness which in one or other of its innumerable forms—either by indolence, indifference, or downright wrongdoing—creates a state of things which renders it difficult to do right and easy to do wrong. What is the field of its operations? The whole range of the life of man, so far as it touches the life of his brother man. And what is the principle on which it is constituted? The principle of brotherly co-operation on the part of all who are willing to take trouble to make things better, so that the collective moral force of the whole community may be brought to bear to promote the welfare of the whole community.

THE CIVIC CHURCH DISTINCTIVELY CHRISTIAN.

To a Christian such a Church seems to be based upon the central principle of the Christian religion. To Christians who recognise that God is no respecter of persons, but in every nation he that feareth Him and worketh righteousness is accepted of Him, all religions have in them something of God, all have something of help in them by which man is able to attain nearer to the Divine, and all, therefore, have something to teach us as to how we can best accomplish the great work that lies before all religions, viz., How to remake man in the image of God. To a Christian that religion is the truest which helps most to make men like Jesus Christ. The Apostle says, "There is neither Jew nor Greek, there is neither bond nor free, there is neither male nor female, for ye are all one in Christ Jesus." The Civic Church accepts that principle and carries it out to its logical ultimate. Who are those who are in Christ Jesus? Those who conform to certain outward rites, call themselves by particular names, or worship according to a certain order? Not so. Those who are in Christ Jesus are those who have put on Christ, who are baptised with His spirit, who deny themselves to help those who need helping, who sacrifice their lives to save their fellow-men—in other words, those who take trouble to do good to others. And it is time they were gathered into a society which could act as an associated unit of organisation for the realisation of the ideal. The recognition of this wide brotherhood of all who take up their cross to follow Christ, must necessarily precede the attempt to secure federated co-operation for the attainment of a common end. To take up your cross, what is that but to deny yourself; and to follow Christ—but to give up time, thought, and energy to the service of your fellow-men? Those who do that, so far as they do that, constitute the Church militant below which will constitute the Church triumphant above. And the triumph of the Church

will be achieved the sooner, the more readily the Church militant below gets into line, recognises its essential unity, and employs its collective strength against the common foe.

THE SPIRITUAL COUNTERPART OF THE TOWN COUNCIL.

What is proposed in the Civic Church is that in every centre of population there should be one Church centre, constituted of representatives and of delegates from all the Churches and all the organisations which exist for the purpose of making man better and the world sweeter to live in. One Town, one Church, is as old as the days of the Apostles. We had the angel of the Church of Thyatira, the angel of the Church of Ephesus. Who is the Angel of the Church of Chicago? Who is the accredited chief of the religious and moral forces of this great city? For combatting sin when it develops into crime, you have your chief constable. For combatting sin when it takes the form of disease, you have your sanitary authority; and for combatting sin when it takes the form of anything touching the pockets or the bodies of the citizens, you have the mayor. Everywhere centralised authority, definite responsibility, recognised and obeyed by every citizen within your civic boundaries. But when sin only threatens the souls of men, where is your central authority? In the great campaign against the power of evil seated in the heart of man, where is your spiritual director-general?—the spiritual counterpart to your chief constable or your mayor. You have no such officer. Is it not time you made some effort to see whether, even now, he could not be brought into being?

Co-operation is constantly invoked for purposes of sanitation and of police. Why should it not be equally efficacious in the work of securing the moral and spiritual progress of society?

There is no suggestion on the part of the advocates of the Civic Church that a committee representing the various existing organisations for mending the world, and the men and women who are willing to take trouble to do good to others, should supersede any existing institution. The Civic Church comes into existence not to supersede, but rather to energeise all the institutions that make for righteousness, to bring them into sympathetic communication the one with the other, and to adopt the sensible methods of municipal administration, with its accurate geographical demarcation and strict apportionment of responsibility, for securing the performance of the services which mankind expects from the Church.

FOR THE REALISING OF THE IDEAL.

Broadly speaking, the difference between the municipality and the Civic Church is that one deals solely with the enforcement of such a minimum of co-operation as is laid down by Act of Parliament, while the other seeks to secure conformity, not to the clauses of a law, but to the higher standard which is fixed by the realisable aspirations of mankind for a higher life and a more human, not to say divine, existence. The Church lives for ever in the realm of the ideal. She labours in the van of human progress, educating the community up to an ever-widening and expanding conception of social obligations. As soon as her educational work is complete she hands over to the State the performance of duties which formerly were exclusively discharged by the Church. The relief of the poor, the establishment of hospitals, the opening of libraries, the education of the children—all these in former times were entrusted to the Church. But as the Church educated the people, these duties were transferred one by one to the care of the State.

The Church did not, however, lose any of her responsibilities in regard to these matters, nor did the transfer of her obligations to the shoulders of ratepaid officials leave her with a corresponding lack of work to be performed. The duty of the Church became indirect, rather than direct. Instead of relieving the poor, teaching the young, caring for the sick, her duty was to see that the public bodies who had inherited the responsibilities were worthy of their position, and never fell below the standard either in morals or in philanthropy which the Church had attained.

THE CIVIC CHURCH AS A MORAL CAUCUS.

There is little doubt that in any English or American city the good people could rule if they would take as much trouble to organise and work for the victory of justice, honesty, purity, and righteousness, as the bad people take to secure the rule of the rum seller and the dust contractor. But where are they to find their organising central point? They can only find it in the Civic Church, the establishment of which in every community is indispensable, if the forces which make for righteousness and progress are to have their rightful ascendancy in the governance of our cities.

The Civic Church would of necessity become an electoral centre—what may be described as a Moral Caucus, created for the purpose of making conscience supreme in the government of the affairs of the town.

First and foremost, the Civic Church would, wherever it was powerful, render absolutely impossible the nomination of candidates notoriously dishonest and immoral.

Secondly, the Civic Church, on the eve of every election, could and would stir up all the affiliated Churches to appeal to the best citizens to regard the service of the municipality as a duty which they owe to God and man, and to all citizens to prepare for the ballot with a due sense of the religious responsibility of the exercise of citizenship. The Civic Church could also bring almost irresistible pressure to bear to prevent the coercion, the corruption, and the lying which are at present so often regarded as excusable, if not legitimate methods of influencing elections.

Thirdly, there are always in all elections certain great moral issues upon which all good men agree of whatever party they may be. But as these issues seldom affect except adversely, the pockets of wealthy and powerful interests, they are ignored. The Civic Church would bring them to the front and keep them there. All that is needed is that the professedly religious men should be as resolute to pull the wires for the Kingdom of Heaven as irreligious men are to roll logs for the benefit of the gaming hell or the gin-shop. For all the speculation, corruption, jobbery, and pandering to the drunkard, the gambler, and the prostitute which disgrace so many of our cities, the responsibility lies at the door of the Churches. They have for the most part abandoned the electoral field to the world, the flesh and the devil, and then piously marvel how it is the Kingdom of Heaven is so long in getting itself established amongst us.

ITS SOCIAL OBLIGATIONS.

The duty of the Civic Church is to inspire and direct mankind in all matters pertaining to the right conduct of life, the amelioration of the condition of the people, and the progressive development of a more perfect social system. The best way in which this truth can be brought out into clear relief is to take the life of man from the cradle to the grave, and in a rapid and necessarily most incomplete survey, to point out objects which command

the undivided support of all men of all religions, and which, therefore, could be much more efficiently pursued in common or in concert than by the isolated and independent action of a multitude of small organisations. In making this survey I do not attempt to draw up any scheme of ideal perfection. I rigidly confine myself to stating the best that has already been attained by the most advanced civilisations or by the most progressive citizens. I frame my Civic Church programme strictly on the principle of levelling up. What the most forward have already attained can be in time attained by the most backward. Absolute originality is not for federations, which of necessity must not advance beyond the solid round of verified experiment and ascertained fact. As the Civic Church is in advance of the State, so the individual reformer is ever in advance of the Civic Church. The heretic always leads the van. What the Civic Church can do is to generalise for the benefit of all the advantages which have hitherto been confined to the few.

I.—TO THE INFANT.

I begin with the child; everything begins with the child. And the Civic Church begins with the child before his birth. At present, the most important of all moral issues, the most momentous of all human acts—that in which man approaches most closely to the Creator—is left, in ninety-nine cases out of a hundred, absolutely to the caprice or passion of uninstructed human nature. The realm where if anywhere Conscience should be king and Reason his prime minister, is abandoned by the Churches everywhere to the uninspired, untrained promptings of animal instinct. The first doctrine of the Civic Church, as I conceive it, is an urgent insistence upon the infinite responsibility of parentage, and especially of paternity. Every child has a right to be well born of healthy parents with legitimate status, and no child ought to be born into the world unless his parents have the means and the opportunity to provide him adequately with food, clothing, shelter, and education. The responsibility attaching to this rests with the parents. The obligation which in savage times was and is accepted by the State or the tribe, which rectified by infanticide the over-productiveness of its members, is now ignored alike by Church and State. The individual is left to the unguided direction of impulse, without help or guidance from religion, and with the most disastrous consequences to millions of supernumerary children who are annually spawned into a world which does not want them, in which they are hopelessly unfit to struggle for existence. A curse to themselves, a ruinous burden to their parents, and a weakness to the State, their multiplication goes on unchecked, without even a warning voice as to the reckless and wanton incurring of the most tremendous of all responsibilities. Surely here, if anywhere, there is a wide field white unto the harvest for the spiritual power. It is not a case for Acts of Parliament. The only tribunal is the individual conscience of the human being. And before that tribunal the collective conscience of the community finding utterance in the Civic Church should not surely be dumb.

The inculcation of the immense responsibilities of parentage would lead directly to an improvement in antenatal conditions which at present are too often ignored. The woman about to be a mother, who bears the new generation beneath her heart, ought to be an object of much greater solicitude and reverence than is the case at present. In nine cases out of ten she is left in the

profoundest ignorance as to the influence which her surroundings and her actions may have upon the unborn child; hence much ill-health to her and subsequent suffering for the child. Pregnant women are often hard-driven in home and in factory, imperfectly nourished, and forced into scenes which seal the fate of their offspring before it sees the light. This crime against the rising generation—how is it dealt with in the Churches? There is much said for and against the immaculate conception of a Jewish woman, now dead and buried nineteen centuries; but what is being done by those who call themselves by her Son's name to secure for her sisters, who have conceived more or less unimmaculately, a reasonable chance of bringing forth a Son of Man not doomed and blighted from the womb to a hopeless existence of disease and sin? That which a wise, loving, well-to-do husband seeks to secure for his own wife, it would be the duty of the Civic Church to endeavour to secure for the mothers of the whole community.

When the child comes to the birth, there is at every step need for the watchful care of the Church. To this day the provision made for the training and status of the midwife, in England, at least, is a disgrace to our civilisation. Legislators are tinkering at it, but they have no force of public opinion behind them. So nothing is done, and every year a multitude of children perish at birth who might have lived if the "wise woman" had been really wise. But the very last place to which the advocates of this most necessary reform appeal for support is the Church. Lying-in hospitals are a necessity of great towns; the Civic Church would see that they existed in sufficient numbers, and that they were conducted with humanity. The question of Foundling Hospitals is one on which much may be said. If the great evil of the advent of unwanted children were seriously grappled with, the need for such institutions would dwindle to a minimum. At present, with the subject ignored by the Churches, the community that closes the Foundling Hospital with one hand, opens the murderous Baby Farm with the other.

The question of the responsibility of the father is one of which Churches as a rule say little. The law of most Christian countries is an infamy which shows how little Christendom really believes its Paternoster. In countries where the Code Napoleon prevails all inquiry into the paternity of any illegitimate child is absolutely forbidden by law. The English Bastardy Law is not so cynically inhuman, but in practice it is almost as bad. The obstacles in the way of bringing the putative father to justice are almost insuperable, and when the order is made for the payment of the weekly dole, every possible opportunity is afforded the man to evade his responsibilities. The Civic Church would never rest until it secured the recognition by the State of the fundamental principle that wherever a child is born into the world, the mere fact of its birth entailed upon the father a permanent legal liability, enforceable at any police-court, to maintain his offspring, and a permanent disability to marry any woman save the mother of his child without incurring the penalties of bigamy. Every child has a right to two legal parents, and nothing can be more scandalous than the way in which the law connives at the evasion of the most elementary of all human responsibilities. The right of the strong to oppress the weak is seldom more cynically asserted than in the legal provision by which the whole burden of parenthood is thrown upon the parent who suffers, while the other who suffers nothing goes free.

When the child is born it needs nourishment, and the supply of good milk cheap is one of the first necessities

of its existence. I well remember Thomas Carlyle speaking to me with much sad bitterness of the change that had come over the rural districts of Scotland in his lifetime. "Nowadays," he said, "the poor bairns cannot get a sup of milk to their porridge. The whole of the milk is sent off to town, and the labourer's child gets none. The result is that they are brought up on slops, and the breed decays." A little thought might have secured the peasantry against this loss of their natural means of subsistence, but the Church does not take thought for such trifles. The lairds and the large farmers sent the milk to the best market, and the children of the men who tilled their land had to do without. To deprive children of milk is simply infanticide at one or two removes.

Where women are employed in factories or the fields, the crèche is a necessity. But too often these institutions are very badly managed, and there is in almost all cases a total absence of intelligent and loving supervision. If in every industrial district where women are employed away from home there were established a sufficient number of crèches of the best pattern under good management, a great deal of preventible suffering would be banished from the most helpless of our race.

The prevention of cruelty to children is surely one of the good works upon which the Civic Church could agree without one dissentient voice. The fact that in all our cities a certain number of children are annually tortured to death by starvation, blows, and all manner of hideous brutalities is unfortunately but too well attested by the Reports of the Society for the Prevention of Cruelty to Children. But until Mr. Waugh arose to force the facts upon the knowledge of an unwilling world these deeds of darkness remained hid, and in bringing them to light he has received much more help from the constable than from the churches founded by Him who said, "Suffer the little ones to come unto me, for of such is the kingdom of heaven." The responsibility for searching out these helpless suffering ones is surely the duty of the Church, and the Civic Church Centre would see to it that once a year at least the importance of pressing this subject upon the attention of the congregations was brought before all the churches in the city.

Behind cruelty stands murder—murder for gain, systematised murder facilitated by insurance companies. The whole question of Child Insurance is one on which the Civic Church would have much to say. The churches at present know next to nothing about it. That some parents do insure the lives of their children in order to realise a profit by their death is unfortunately but too well proved. But where is the Centre in any town or city where the terrible subject can be taken into consideration by the picked representatives of philanthropy and religion? Alas! it does not exist. And as a result the operations of philanthropists and religious men in this, as in other matters, are as spasmodic and fitful as the movements of the limbs of a frog after its brain has been removed. The *medulla oblongata* of the philanthropic and religious world—that is the Civic Church.

II.—TO THE CHILD.

So we may go on. From the infant we come to the child. Here we have a constantly extending field for the intelligent activity of the Civic Church. Every child ought to be protected against the exploitation of his life until he is at least thirteen years of age. That is the child's learning-time. To put him to work before then is to compel him to live on his capital, and to impoverish him for the rest of his life. The whole influence of the Civic Church would be thrown into the scale in favour

of postponing child labour until at least thirteen years had been allowed in which to grow and play and learn. It is only within very recent times and only in some countries that children of tender years have ceased to be regarded as the legitimate chattels of their parents. The spectacle of some streets swarming after dark with the vendors of newspapers, matches, etc., is a melancholy reflection upon the civilisation that necessitates such immolation of childhood.

If exemption from being driven to mine and factory and the workshop until after thirteen years of age be the first clause in the Children's Charter, the second provision of places in which to play. To the young child a playground is more important than a school. But in most cities the street with all its dangers, or the gutter with all its filth, is the only playground of the child. Within five minutes from every door there should be the counterpart of the village green, where the little toddlers could roll and frolic without dread of the wheels of the van or the rush of the street. A few great parks at great intervals are no substitute for the playground close at hand. And as there should be public playgrounds open to all in fine weather, so there should be playgrounds under cover, lighted and warmed, for use in weather or in winter. The Civic Church could do much in this way. There are plenty of odd corners and empty sites that might be utilised for playgrounds if there were but a public body ready to take the matter in hand. In the empty but spacious halls of our Board Schools there is, in the evening, at least, ample playing-room for the children of our cities. But all these things need direction, organisation, and the co-operation of all the agencies. How can these be secured save by the Civic Church?

This opens up another vista of usefulness. The Civic Church should be a great intermediary between the State and Lazarus, between those who have more than they know what to do with, and those who have not enough to support existence. Take, for instance, the lawns, the pleasure grounds, and the gardens of the great houses. They remain for the most part unused, for more than a couple of hours a day. Around the great sylvan oases, often existing close to teeming cities, there are thousands of children to whom an hour's play on the green grass under the shady trees would seem a foretaste of heaven. But who is there to urge on the villadom the admission of the children of slum-dwellers to their gardens and grounds, and who is there who can devise ways and means by which such admission would not be as destructive as an incursion of the Goths and Vandals? Here again there is a great gap in our social organisation which the Civic Church alone can fill.

After a place to play in, the child needs most a place to learn in. And it will be well if the first school to be made as much of a playing place as possible. The advocacy of the more extended use of the method of the Kindergarten, the Church could lift from many a weary little head a burden which it was never intended to bear. Education for young children can be made a delight instead of, as too often it is at present, a made a torture. The whole question of the efficiency of education in school, in all its stages, can never be solved from the thought of the Civic Church. This involves a meddling interference with the proper function of the School Board. But it does involve a constant encouragement to the best members of the School Board to press on to the attainment of the highest possible efficiency. In every Board there are those who would improve and those who would stand still or even regress.

The improving section need the constant sustaining force of public opinion, of which the Civic Church would be the most efficient educator and exponent. Nor can the schools be left to the uncovenanted mercies of the law. In Lancashire, school children by the hundred have had their sight injured for life by the ill-arranged lighting of the class-rooms. The poor suffer long, and are dumb. The Civic Church would be constantly on the alert to note their sufferings, in order to employ the collective force of the conscience of the whole community in order to bring about the necessary change. Nor is the prevention of unconsidered pain the only work that is waiting to be done in the schools. The school ought to be constantly kept before the mind of the community as the common property of all, to be cherished by all, and to be made a subject of pride by all. Each district should take a pleasure in adorning the school walls, and in ministering to the efficiency of the teachers. How many Board School teachers never receive a single friendly word by letter or by mouth from the best people in the district where they live? Salary they get from the Board, but social status and the sense of consideration that comes from being on visiting terms of friendship with the best people in the district, that cannot be given by authority. It can only be secured by the education of public opinion, and the inculcation of this development of friendship is a duty which the parents owe to the teacher. All manner of simple modes of stimulating a friendly rivalry between schools and of encouraging diligent scholars, such as the presentation of champion shields for gymnastics and the distribution of prizes for knowledge of the Bible or of natural history, come within the natural scope of the Civic Church.

The duty of providing the children with the rudiments of education is imposed upon the local authorities by Act of Parliament. But the extras, the side-shows, the subsidiary instruction in the graces of life—these must be undertaken by private benevolence. Every child should be in attendance at a Sabbath school; but what authority is there at present capable and willing to take a census of the child population of the town in order to ascertain how far the Sunday-schools cover the whole ground? Only in one place—at Bradford—as the direct result of the agitation in favour of the Civic Church, the Nonconforming Churches combined for the purpose of taking a religious census; but elsewhere the Sunday-schools work in the dark. Then there are the various agencies which exist for the purpose of training children in obedience, thrift, mercy, temperance, and good citizenship. Here and there there is a Boys' Brigade, or a Band of Hope, or a Band of Mercy, or a School Savings Bank; but the ground is not covered. It is not even mapped out. There is no agency that has the right to inquire into these things or the authority to press upon the existing agencies to level up to the standard of the better provided districts.

In the case of orphans, and children who are in a special manner the children of the State, there is everywhere the same absence of systematic, comprehensive action. Here and there private philanthropists will found orphanages, or a single church, like Mr. Spurgeon's, will undertake to provide for the fatherless; but the Civic Church will have to be created before the duty of caring for the orphan will be adequately performed. There is an almost universal agreement among the best authorities that children left to the guardians are much better boarded out than brought up in the workhouse taint. But how many workhouses teem with children, and how often the timid proposals of the reformer for

making a change in this respect are baffled by the *vis inertiae* of prejudice and use and wont? Whether the children are boarded out or massed together in the workhouse, there is a constant need for the healthful, life-giving influence of loving supervisors. These children are the natural objects of the mother-love that is running to waste in the community. The heart of many a childless wife or lonely old maid would be filled with gladness and joy if they could but be taught to mother the orphan family in the Union. But a thousand obstacles are placed in their way, and there is no Civic Church to constantly urge this mothering of the motherless children upon the attention of the unemployed women of the middle class.

Toys and picture-books are needed. Mr. Labouchere in London, through the columns of *Truth*, does more to supply this need than all the churches, although I am glad to say that toy services are now becoming more common. Why should not the superfluity of the well-to-do nurseries be utilised for the benefit of the children of the community? Every one agrees that it would be well to do this. But how to get it done is the question, and, short of the creation of the Civic Centre which would exercise a kind of philanthropic episcopate over the whole community, I see no other resource.

III.—TO THE YOUTH.

When the child grows up and attains the status of a youth, the widening temptations of life widen the field of usefulness for the Civic Church. The provision of a system of scholarships, by which the most capable youths of either sex should be assisted in obtaining the best education which school or university can afford, is no dream of the visionary idealist. Such provision is made here and there. It would be the duty of the Civic Church to make it universal. The endowments intended for the poor, now monopolised by the rich, need to be reclaimed for their rightful owners. Every community should have a complete system of graded schools through which the scholar should be passed, from the Kindergarten to the University. Endowments should be divided equally between the sexes, instead of being distributed on the principle that to him that hath shall be given, while from her that hath not shall be taken even that which she has.

Every town should have its branch of the Home Reading Union, and every school its Recreative Evening Classes. Provision should be made of quiet class-rooms where the student could pursue the studies which would be impossible amid the distractions of a crowded room. Playing-fields, available for cricket, football, hockey, and lawn-tennis, should be preserved with jealous care in the heart of every urban community. Opportunities for learning to swim, and, if possible, to boat, should be provided in every centre of population. Regular field clubs and garden associations should be formed, in order to develop a taste for natural history and a love of flowers. And in winter, when outdoor pursuits are impossible, there should be in every district a warm and well-lighted popular drawing-room, where the young people could meet for social purposes, instead of being confronted with the alternatives of the street or the music-hall. The youth of every town needs the gymnastic classes and all the conveniences of the Polytechnic or the People's Palace. But who is to secure this? The individual is as powerless as the isolated church or chapel. It requires the combined action of all the philanthropists of the community to secure these advan-

tages for the young. But the organising centre as yet does not exist.

There is another branch of education which urgently demands the attention of those who care for the future of society. That is the teaching boys and girls ripening into maturity the simple physiological truth about their own bodies, and the immense danger of yielding to the temptation of itching curiosity or immoral experiment. Protestantism denounces the Confessional and provides no substitute. Hence self-abuse, unnatural vices, and wholesale contamination of the springs of life in both sexes. The inculcation of these necessary truths should be strengthened by vigorous enforcement of the law against youthful vice. These things are supposed by many to be beyond the scope of the ecclesiastical churches, whose eyes are fixed upon the far-off heaven beyond the grave. But the Civic Church would at least try to stop this yawning gulf down which thousands every year plunge to hell.

The Civic Church will seek to strengthen the law where it exists, and to strengthen it where it is faulty and inadequate. But in securing the teaching of temperance in schools it need not appeal to the law; it only needs to educate those who are entrusted with the control of the education of the people.

The need for technical education for the youth of both sexes, although generally recognised, is almost as generally neglected. The old technical education of the household enjoyed by our grandmothers is vanishing fast; the new generation is growing up uninstructed in the household arts. But who will press forward the consideration of these subjects?

The homing of the youth in our great cities, the making of provision for the young man and young woman from the country who find themselves suddenly launched into the midst of a wilderness of houses, all peopled by unsympathetic strangers—there is a vast field for religious and philanthropic endeavour. The home is the great nursery of all the virtues and all the amenities of life. How to create substitutes for the home for the benefit of the dishomed, this is one of the problems which the Civic Church might profitably press upon the attention of all the Churches.

Beneath all these questions for the employment of the leisure of youth there lies the fundamental question of the securing of leisure itself. The necessity of shortening the hours of labour for those who have not yet attained maturity is admitted by all sociologists. But where is the rallying centre for the advocates of early closing, for Sunday rest, and a weekly half holiday? In olden times it would have been the mediæval Church which would naturally have assumed the rôle of tribune of the people. But to-day it is the Civic Church and the Civic Church alone which will have authority enough to undertake to lead the forces which are contending for leisure for youth.

As I go on unfolding—I am afraid to the weariness of my hearers—page after page of the endless series of philanthropic activities in which the Civic Church might play the leading part, I marvel at the immensity of the humanitarian effort that is demanded, but I marvel still more at the silence of so many of our pulpits and the indifference of so many of our churches to the pressing needs of the human race. My heart stirs within me when I contemplate the innumerable good causes of our own time which urgently and clamantly demand the attention of religious men, and I contrast with these needs the arid and empty dialectic which does duty for a sermon in many of our pulpits. Instead of being the leader in all good works,

the director-general of the world-transforming crusade, the religious teacher has often drivelled into a mere ecclesiastical Mr. Fribble, who drivels through twenty minutes of more or less polished inanity, and then subsides into complacent silence, feeling that he has done his duty. Meanwhile the hungry sheep look up and are not fed, and humanity bereft of its natural leaders wanders aimlessly about in the wilderness of sin, seeking guidance everywhere and finding it not. Nor will it find it until by the reconstitution of the Civic Church we create once more a centre of inspiration and of counsel round which will gather all the energy and enthusiasm that exist in the community for the realisation of our social ideals.

The field is white unto the harvest and the labourers are few. And of those who have entered their names as labourers, how many are there who are twiddling their thumbs over more or less aimless banalities and ecclesiastical twaddle?

IV.—TO THE ADULT.

So far, I have but described the work which the Civic Church might do in the service of the young. I have said nothing concerning the work that awaits it in relation to the adults. To describe that even in the most cursory fashion would need a volume. But lest any should say that I have shirked the most important part of my subject, I will jot down, without any pretence at exhaustive or scientific definition, some of the services which the Civic Church might render to the adult citizen often in connection with existing institutions. In drawing up this formidable catalogue of labours that await this modern Hercules, I strictly confine myself to indicating useful work which has been accomplished in some places, and which, pending the intervention of the State, can be accomplished everywhere by the efforts of some such voluntary agency as the Civic Church.

THE ADULT AS A CITIZEN.

1. The education of the householder as to his civic and national responsibilities.
2. The stimulating of an intelligent interest in political and municipal issues.
3. The keeping moral issues to the front, as caucuses keep party issues.
4. The representation of the unrepresented, whether women, children, paupers, or subject races.
5. The cultivation of patriotism and the religion of citizenship.
6. The stemming the tide of national hatreds, and claiming justice even for the enemy.
7. The formation of volunteer corps.
8. The establishment of life and fire brigades.

THE ADULT AS A WORKER.

1. The development of self-reliance and mutual help by the formation of Trade Unions.
2. The shortening of excessive hours of labour.
3. The enforcement of the laws for the protection of labour.
4. The encouragement of industrial arbitration.
5. The promotion of co-partnership between employers and employed.
6. The appointment of women inspectors for women workers.
7. The prevention of sweating.
8. The payment of sailors' wages before leaving ship.

THE ADULT IN SICKNESS.

1. Provident dispensaries.
2. Hospitals—general, infectious, and convalescent.
3. Health lectures.
4. Sick nurses.
5. Medical comforts.
6. Change of air for convalescents.

7. Lying-in hospitals.
8. Blind asylums.
9. Deaf and dumb institutions.
10. Lunatic asylums.

THE ADULT IN THE WORKHOUSE.

1. Women on Boards of Guardians.
2. Brabazon scheme for employment of aged.
3. Decoration of walls of wards.
4. Library for inmates.
5. Supply of papers and magazines.
6. Constant supply of visitors.
7. Occasional excursions and treats.
8. Handkerchiefs and night-gowns for the bed-ridden.
9. Tobacco and snuff for the aged.
10. Lantern and other entertainments.
11. Music, instrumental and vocal.

THE ADULT AT LEISURE.

1. A minimum of public-houses, and those well conducted.
2. Saturday night and Sunday closing.
3. Clubs for men and women—temperance hotels.
4. Free library and reading-rooms.
5. Popular social evenings in board schools.
6. Good theatre and decent music-halls.
7. Bands in parks.
8. The preservation of open spaces.
9. Shade-trees and seats in streets.
10. Kiosks, lavatories, and drinking fountains in streets.
11. Lantern lectures.
12. University extension lectures.
13. Museums and art galleries.
14. Open churches and organ recitals.

THE ADULT IN BUSINESS.

1. Honest friendly societies.
2. Old age pensions.
3. Advisory council re investments.
4. Trade protection societies.
5. Co-operative societies.
6. The poor man's banker—Monts de Piété—popular banks.
7. The providing of adequate drinking-fountains and lavatories in workshops and factories.
8. The establishment of the six days' working week.
9. Dining-halls with music.

THE ADULT OUT OF WORK.

1. Establishment of labour registries.
2. The creation of labour colonies.
3. The direction of emigration.
4. The improvement of casual wards.
5. The organisation of charitable relief.
6. Temporary work for the unemployed.
7. The development of cottage industries.
8. Every man his allotment.

THE ADULT AT HOME.

1. Instead of slums, improved dwellings.
2. A good water-supply.
3. Sanitary drainage.
4. Free baths and washhouses.
5. A garden for every home, if it is only a window-box.
6. Cheap transit by tram and rail.
7. Municipal lodging-houses.
8. Visitors for doss-houses.
9. Co-operative homes.

THE ADULT IN DEATH.

1. Homes for the dying.
2. Reformed funerals.
3. Cremation.

MISCELLANEOUS.

1. Enforcing the law against gambling.
2. Discouraging prostitution.
3. The poor man's lawyer.
4. Cab-shelters.
5. Enforcement of law against smoke.
6. Preventing the pollution of rivers.
7. Music and visiting in prison.
8. Prison-gate brigade.
9. Resene homes and inebriate asylums.
10. Country holidays.
11. Pilgrimages—historical and religious.

Such are a few of the subjects upon which the community needs guidance, which the Civic Church would be constantly needed to give. There is hardly a community in which some progress has not been made by individuals, or by Churches, or by other societies, in the solution of the problems to which I have briefly alluded. But in no community is there any organised effort to secure for all the citizens all the advantages which have been secured for a favoured few here and there. What is wanted is a Civic Centre which will generalise for the benefit of all the results obtained by isolated workers. The first desideratum is to obtain a man or woman who can look at the community as a whole, and who will resolve that he or she, as the case may be, will never rest until the whole community is brought up to the standard of the most advanced societies. Such a determined worker has the nucleus of the Civic Church under his own hat; but, of course, if he is to succeed in his enterprise he must endeavour by hook or by crook to get into existence some federation of the moral and religious forces which would be recognised by the community as having authority to speak in the name and with the experience of the Civic Church. The work will of necessity be tentative and slow. Nor do I dream of evolving an ideal collective Humanitarian Episcopate on democratic lines all at once. But if the idea is once well grasped by the right man or woman, it will grow. The necessities of mankind will foster it, and all the forces of civilisation and of religion will work for the establishment of the Civic Church.

THE ANGLICAN PRIMATE'S MISTAKE.

I AM glad to see that the *July Review of the Churches* deals faithfully with the Archbishop of Canterbury for his refusal to attend, or to sanction the attendance of any representative of the Anglican Church at Chicago at the Great Parliament of Religions. The reviewer says:—

The principle involved in this refusal also cuts at the root of conference on the subject of Christian Reunion. If a strong conviction of the rightness of our own position is to preclude us entering into consultation with others, on an equal footing conceded for a while at least, then the best means of arriving at a mutual understanding is deliberately flung away.

To reduce the question to its simplest form, suppose three men, one a Moslem, one a Brahman, one an Anglo-Catholic, who often meet each other in trade, in politics, in social relaxation. One day when they are walking together their conversation takes a deeply spiritual turn. They touch on the borders of vital religion. At last the Moslem says, "My friends, let us come out of this public way. Let us go together into some room by ourselves. Let us tell each other there how we have been most helped in our religious life. We will not argue. We will only speak out of our heart's fulness, and pray each in his own way light and strength for all." Now what ought the Anglo-Catholic to do? According to the log of the Primate's letter, he ought to decline the invitation, on the ground that his church and his religion would be compromised by his going on equal terms with Brahman Moslem!

A "CORRESPONDENCE CHURCH."

A SUGGESTION.

WHEN the REVIEW OF REVIEWS was founded, now nearly four years ago, we received offers of help from so many of our readers in so many different constituencies, that we formed what has since been known as the Association of Helpers. Out of that Association sprang the movement towards the Civic Church. Both the Association and the Civic Church have the same root-idea—the responsibility of the individual for the welfare of the community, and the need for concerted effort on the part of all who desire the public good to promote the salvation of the body politic as well as of the individual.

Side by side with the formation of the Association of Helpers we published the suggestion, based upon the story of Ellen Middleton, that some substitute for the Confessional—not for purposes of absolution, but for direction and counsel—might with advantage be created, and, in default of any more efficient volunteer, I offered to receive communications from those in trouble. The results of that offer would, if written out, form a romance of enthralling interest; but of course that is impossible. The offer was taken advantage of by many of the most unlikely persons in all ranks, from the highest to the lowest, and I am glad to know that in many instances the counsel so sought has been the means of saving many from misery, and some from a condition of almost suicidal despair.

I am therefore not in the least surprised to find that in the discussion which the *Daily Chronicle* has raised upon suicide, the suggestion has cropped up for the development and extension of the lay confessional, which excited so much ridicule when I mooted it in 1890. The idea is a sound one, and the only question is how best it can be made universally available. The suggestion of the Rev. Holden Sampson, of Redhill, as explained in the *Chronicle*, is as follows:—

Hence are there so many disgusted mortals—especially young people thrown back upon their own imperfections, and driven to the utmost doubt of the truth of Christianity. Hence are the ranks of agnosticism, materialism, and pessimism swelled by multitudes of disappointed souls. What is wanted before everything else is a *via media* between despondent souls and those who have overcome and are able to guide. As these are scattered all over the land, and strangers mostly one to the other, we want what I would call a "Correspondence Church." Could not some organisation be set on foot, as a permanent outcome of this controversy, by which men may be brought together for mutual aid and counsel? I would suggest that certain leaders of thought, such as Archdeacon Farrar, George MacDonald, Dr. Horton, Herbert Burrows, W. T. Stead, Hugh Price Hughes, and other men and women in the front of practical present-day thought, quite apart from any sectarian or specific theological lines, be invited to join in offering, through correspondence, lectures, conversations, etc., their matured knowledge on all questions which have led to so many shipwrecks of soul and body. Also that some central office be opened through which the correspondence may pass, and all arrangements for the benefit of correspondents and inquirers may be made. It would form a kind of reformed, modernised, and rationalised confessional, not sacerdotal, not theological, not dogmatic, but charitable, intellectual, and sympathetic in its purposes and plans.

Here we have the same idea as I put forward in the first number of the REVIEW, and it set me thinking. Mr. Sampson's list of leaders of thought is unduly

narrow. In my original scheme, Sir George Lewis would have figured more prominently than any of those whom Mr. Sampson mentioned; but that is a detail. The important thing, as I stated it in propounding the original scheme, was that the cases of those who sought guidance should be placed before such competent and skilful advisers as I am able to gather round me from amongst the best men and women of the English-speaking world. The question was put forward tentatively, and it brought me a mass of work which I could with difficulty get through; but the appeals which the letters of my correspondents contained thoroughly justified the original proposal. Here in the heart of Society is a felt want, if ever there is one. Why should not something practical on a wider scale be done to supply it?

The same idea appears to have occurred simultaneously to several of my readers, and from their communications it would seem that the time had come for an attempt to combine the two ideas of the Association of Helpers and the Lay Confessional, in order to create an association which would enable men and women all over the world to lend a hand to help each other. There are plenty of societies in existence already, no doubt, but none that precisely meet this want. The Society of Kings' Daughters in America and the Letter Guilds in this country afford useful suggestions as to the most likely basis upon which such a Correspondence Church should be based. The Civic Church deals with the community, the Correspondence Church with the individual. Both are necessary, and one supplements and completes the other.

Now, before attempting to give any practical shape to this suggestion, may I ask my Helpers and the secretaries of all existing guilds, organisations, leagues, and societies which to a greater or less extent already occupy the ground, to communicate with me before October 1st, with particulars of their organisations. I shall also welcome any hints from the general reader that will tend to the realisation of the object which we have in view.

I AM glad to hear that it is proposed to form a branch of the Civic Church under the title of the Social Questions' Union in Radcliffe and District. Radcliffe is near Manchester, and the rules are based on those of the Manches'er Union. The Sub-Committees for acquiring information and conducting the operations of the Union, elected at the executive meeting, deal with the following subjects: Temperance, Gambling, Social Purity, Educational and Recreative, Labour, Conditions of Home Life.

THE Rev. Newman Hall, writing on "The Jubilee of Memories" in the *Sunday Magazine*, gossips pleasantly concerning the notable Americans whom he saw when on his visit to the United States. He says, among other things:—

Mrs. Stowe told me how her tale of Uncle Tom originated. She was at a Holy Communion service, when suddenly the death-scene of the story was presented vividly to her mind. She seemed to see it as a reality. This was the germ of the whole. It was first described, and suggested the rest of that marvellous book.

A MORAL REVIVAL IN FRANCE.

WANTED, A SOCIETY OF MORAL SUCCOUR!

In the *Atlantic Monthly* for September, Aline Gorren has a very interesting paper on what she calls the "Moral Revival in France." I have frequently called attention to the same subject when it has been noticed in other articles, but Aline Gorren tells the story more plainly than it has been told hitherto. She says:—

Everywhere the world wants a new Christianity. But it wants it, and will have it differently, according to race and need.

FAITH THE NEW WATCHWORD.

She maintains that there is going on all around us a great religious revival, which is most practically defined and visible in France:—

Not scepticism, but faith, is the watchword now sounded from high places. A certain rigidity in our Anglo-Saxon nature—what Matthew Arnold would call our Hebraism—has prevented us, in America and England, from feeling the full force both of the first movement and of its present countercheck. The continent of Europe has been more sensitive to each influence. A religious, a moral revival is strong in Russia; it inspires certain youthful and still unknown poets of new Germany; it can be traced in the best writers of Italy and Spain. But even as no people have gone further than the French in the application of the conception of life that sprang from the emancipation of reason, and the belief in science as the only revelation, so, with them, the rebound has brought into being conditions more defined, results more practical.

THE NEO-CHRISTIAN LEADERS.

The birth of the so-called Neo Christian movement in France is commonly dated from the publication in 1886 of M. Melchior de Vogüé, of the *Roman Russe*. It began, however, sixteen years before, when the French peasants at Sedan heard their German conquerors sing Luther's hymn on the battle-field:—

MM. de Vogüé, Paul Desjardins, Edouard Rod, Pierre Lasserre, are the true leaders of the moralist movement, the real Neo-Christians; and whatever may be thought of the eventual efficaciousness of their crusade, it would be impossible to mistake the sincerity, the loyalty, the earnestness with which it is conducted. These writers not only admire, but would desire to revive, the morality of the Christian religion, rigidly to enforce it, to make it the ever-present rule of every-day life, but all this while repudiating its orthodox, dogmatic foundations. M. Desjardins's *Le Devoir Présent* is the most definite attempt that has been made to formulate, in France, a general spiritual power which shall be in accord with the metaphysical demands of our time. Two leading ideas detach themselves from M. Desjardins's catechism: the one is a belief in an intellectual priesthood; the other, a belief that all mental gifts and attainments are to be regarded as usufructs, to which the mentally unendowed and physically disinherited have a right.

THE NEW CHURCH.

M. Desjardins has distinctly asserted that he has no desire to form a spiritual sect after the Saint-Simonian or any other manner. He outlines no cult; but he wishes to found in France a lay religious association, a Society of Moral Succour,—somewhat after the fashion of our own Societies of Ethical Culture in America,—which shall have its journals, its lecturers, its writers, and even its seminary; a school of liberty, in which the youth of the country shall be prepared, "by studying Epictetus, Marcus Aurelius, the gospel, St. Augustine, St. Paul, and St. Vincent de Paul," to enter life with the highest moral, and yet the purest practical aims. This is the intellectual priesthood. It must seek to form character in itself and others. If it speculate on the universe, it must only be in so far as, from the fruits of such speculation, immediate incentives may be forthcoming for the furtherance of right actions.

THE SOCIALISTIC SIDE OF SACRIFICE.

As to the socialistic side, M. Desjardins would like to see parents subject their sons, when they have left the universities,

to a few months' contact with the poorest classes of the population, that they may serve an apprenticeship in the trade of life. He would like this knowledge of hardship and ignorance, thus acquired by participation in the lot of the poor, to be retained by frequent subsequent intercourse with the working classes. He repudiates every form of traditional philanthropy. Intellectual almsgiving—free lectures, free reading-rooms—he discountenances as much as physical almsgiving. Procure work, he says, for the needy; and to a few workmen, more intelligent than their fellows, suggest that they establish a reading-club among themselves, that they hire, at their own expense, a lecturer who will treat before them subjects which it is to their interest to know; for the things of the mind can never have any meaning to these people until they are bought at the cost of personal sacrifice.

Upon those who are morally ill, infirm, and perverted of soul, M. Desjardins would impose, through the medium of his Society of Moral Succour, this same saving grace and cure of sacrifice; some direct, immediate task for the aid or the redemption of others. "Right action," he observes, "can alone throw light on mental doubts."

M. Desjardins's ideal association is to include Catholics, Protestants, Jews, Neo-Kantians, men of all shades of belief; for the basis of accord will be a common one, and there will be no disturbing dogmas to bring about division. It would be interesting to observe how far such an association of lay priests could prosper in France.

THE LANTERN SUNDAY LECTURES.

THE response of August to a scheme to be carried out in winter nights is never a fair test of the success of my proposal. Were this not the case I should not persist any further in the attempt to bring out the series of Sunday lectures for the lantern which I outlined in the last number of the *REVIEW*. I have received several enthusiastic letters, but the orders for the series are not sufficient as yet to qualify putting the sets of slides in hand. I am proceeding tentatively, and renew the appeal which I made last month for the assistance of those who want both to help and to be helped in this matter.

My proposal was to bring out a series of a score or more of lantern lectures, dealing with subjects up to date and suitable for Sunday services. These I thought I could supply at £5 5s. the set. As this brings the cost of hire for a week to each subscriber only about 1d. per slide, I do not think that anything can be said against it on the score of expense. But a clerical correspondent writes saying he cannot afford even this. Then I fear he must do without. I am not going to undersell the trade, and to ask that a set of fresh slides with lectures specially written by many of the leading men of the day should be supplied at less than the price of old stock slides that have been years on the market is hardly reasonable. I put the hire of each set at 10s., because I don't want to hire out single sets. My idea was to have a set of subscribers among whom the series of lectures could circulate all through the winter.

I may state that I have received from Messrs. S. W. Partridge and Co. a valuable offer to co-operate in producing these lectures, the whole of their immense store of 70,000 illustrations, which they have published in their various magazines, being freely placed at my disposal as material for slides. Messrs. Macmillan and Co. and several other publishers have kindly permitted me to reproduce illustrations necessary for the series from the pictures in their possession.

All communications on the subject must be addressed to the Secretary, Lantern Department, 18, Pall Mall East, London, S.W.

THE THREE F'S.

AN AMERICAN SUGGESTION.

In the *Arena* for August, the Rev. Henry Frank, in an article entitled "How to Rally the Hosts of Freedom," suggests that something like our Helpers' Association should be formed under the title of "A Federation of Free Fellow Servants," which will be known shortly as the "Three F's."

I have also long seriously thought upon the proclamation of principles for the proposed federation, and I will close this article with the following declarations, which may be helpful in the final formula to be presented:—

1. It shall be the object of the members of this organisation to seek the solution of all issues and problems, religious, scientific, sociological, psychological, and practical.

2. To accept as fundamental such apparent expositions of the truth as accord with thorough research, with unbiassed reason, and with honest purpose.

3. To spread the literature of all reasonable phases of propaganda which seem to promise disenfranchisement from superstition and traditional ignorance, and to cultivate in the human mind an attitude receptive to the demonstration of truth, however repugnant to conventional conviction or respectable adherence.

4. To advocate a just basis for the rightful fraternisation of humanity, wherein justice shall be the foundation of all functional relations; wherein effective labour shall never be defrauded of its own created wealth; wherein, while the social organisation shall be a compact unity, the individual shall be so related to the whole as to be privileged with perfect freedom, so far forth as this shall not encroach upon the rightful freedom of another.

5. To ascertain, by scientific methods, the actual existence of a presumed latent potency in the human mind, known as the psychic, and if discovered, to explore all its possibilities and promises to their utmost limit.

6. To search and expound such ethics as are founded in scientific exposition, appeal to the loftiest ideal, and promise to further the ultimate happiness of the individual, blended in the universal harmony of the social organism.

7. To cultivate among ourselves the social instinct for higher mutual improvement, inviting to our ranks, regardless of "race, colour, or previous condition," of social position or financial qualification, all who may desire to affiliate peaceably with us.

THE BOYS' SUMMER CAMP.

In *McClure's Magazine* for August, Mr. Alfred Balch gives, under the title of "A Boys' Republic," a truthful chronicle of a Boys' Summer Camp Chocorua, which was pitched on the shores of the Big Asquam Lake. Mr. Balch says:—

Big Asquam Lake was more picturesque during the summers from 1881 to 1889, because Camp Chocorua was there, than it has been since. The camp was founded by Mr. Ernest Berkeley Balch as a summer camp for boys, in which they could have plenty of outdoor sport, a reasonable amount of work, and abundant opportunity to enjoy themselves in their own way. Starting with five boys and a small frame shanty in 1881, it grew into one of the oddest institutions that may be imagined. It was different in many ways from anything else of the kind, and its great success was due to the fact that it was modelled on real life as men see it. The motive underlying all of its pleasant features and most quaint customs was twofold: first, responsibility, personally and for others; and, second, work—not only the work which each one must do for himself, but also that extra work which brings with it a tangible reward. The boys were encouraged in everything that would tend to develop them physically, to make them strong and healthy, but they also found themselves members of a little world that had a high standard of honour, a world in which the laws governing the conflicting interests of men were recognised and obeyed.

One of the fundamental rules of the place was that every boy or man there should do his own work and his share of the common work of the camp. Many of the boys who came had never in their lives done anything for themselves, and the first thing demanded of them—that they should make up their own beds and take care of their own clothes—came very hard. The boy was careless, he lost his waterproof; he could not put on his shoes, or could not remember to put away his clothes. There was no punishment for his fault, he was simply ranked as an "Incapable." An Incapable was a boy who did no work of any kind, who belonged to no crew, who had no part in the busy life of the camp except that of a spectator. More than this, an Incapable was forbidden to refuse assistance from any member of a crew, and as it speedily became the fashion to help an Incapable, he had no lack of such assistance. Each boy had an allowance of twenty-five cents a week paid by the camp, and no boy, no matter what the wealth of his parents, was allowed to bring money given him to the camp.

It seems to be a pity that the camp is no longer in existence. Smaller camps might be multiplied everywhere, especially if we are going to have any more summers like the present.

THE SEA AS HEALER.

A PLEA FOR SEASIDE HOSPITALS.

In the *Nouvelle Revue* for the 1st of August M. George Lafargue pleads for seaside hospitals for children. His idea is that the great seaboard of France, from the breezy Channel to the warm Mediterranean, might be utilised for all the weakly, bandy-legged, scrofulous little people in the towns. In Michelet's famous book on the sea, the great prose poet of France quotes an English writer, Russell, who as long ago as 1750 cried up the virtue of the iodine in sea-weeds and in sea air; and it was in England, at Margate, that two English medical men, Drs. Latham and Lettsom, erected the first seaside hospital. Since then the other European countries have taken up the idea, and gone further in its realisation. Italy has set up as many as thirty such establishments; from all parts of the peninsula it is so easy to get to the sea. In France an evangelist, Mademoiselle Coralie Hirsch, whose name should be remembered, was the first to start a marine hospital at Cette in 1847. Four-and-twenty years later the French Government took notice of a small work carried on at Berck-sur-Mer by a medical man, Dr. Perrochaud, and two devoted ladies, Mesdames Duhamel and Marianne Brillard, and built a small wooden hospital of one hundred beds. After which, in the last year of the Empire, a huge pile, called after the Empress, was erected at vast expense. The war swept devastatingly over the charities of France, but in a very few years the efforts began again in a smaller and more reasonable way. Baron James de Rothschild built an institution for Jewish children, also at Berck, and M. Dolfus started another at Cannes in 1880, and one Madame Desjobert left her whole fortune of £60,000 to the Departement of the Landes for a vast sanatorium by the sea. What is wanted, declares M. Lafargue, is a great number of small sanatoriums, built of wood, so that the children need not be too much massed together, and to so multiply these that all the sick and weakly children in France may have a chance of being built up in health by the vivifying breath of the sea. Thousands of wooden spades, thousands of small buckets, and a line of tiny sand-castles fortifying the whole of the coast; no more bleary eyes and bandy legs. Such is M. George Lafargue's vision, and to obtain this result he would fain persuade all the mothers and wives in France to found a national subscription.

THE TRUTH ABOUT TRAMPS.

THE RESULT OF A TRAMP CENSUS.

PROFESSOR J. J. McCook, in the *Forum* for August, gives a very interesting account of the attempt made to ascertain the truth about tramps, by taking down from the lips of the tramps themselves answers to thirty-two questions. By this means more or less complete biographies were obtained of 1,349 tramps from fourteen different cities. The article is an extremely interesting one, both for the facts which it contains and the suggestion with which it closes. The tramp army in the United States, according to Professor McCook—

is a body of 45,845 men—for that is my estimate of their number, made from the best attainable data—an army larger than Wellington's redcoats at Waterloo.

The following figures have been obtained by him from analysing 1,349 reports:—

ANALYSIS OF TRAMPDOM.

More than half, 57·4 per cent., of our 1,349 American tramps have trades, employments, or professions requiring more or less skill; 41·4 per cent. are unskilled labourers. Only sixteen individuals would avow that they had no regular calling. 1,187 of our tramps read and write; eighteen more can read, not write; and only 9·94 per cent. can neither read nor write.

About one tramp in five sleeps in police-stations, one in three in lodging-houses. One in eight sleep "wherever they can," and there is a total of ninety-seven who sleep commonly in box-cars, barns, aboard ship, in paper-mills, water-closets, outdoors, etc.

Only one hundred and thirteen out of the 1,349 who answered admitted that they had no religion. In actual number the order stands thus: Roman Catholics, Lutherans, Methodists, Congregationalists, Presbyterians, Episcopalians, Baptists, and Dutch Reformed. There is also a considerable sprinkling of "Infidels" and "Free Thinkers." Jews are all but lacking.

In order of nativity, America heads the list with 56·1 per cent.; Ireland is next with 20·3 per cent.; England follows with 6·6 per cent.; the Scandinavian Peninsula with 3·4 per cent.; Scotland with 2·6 per cent.

One tramp in twenty is under twenty years of age; three out of five under thirty-five; seventy-five out of every hundred under forty, and one in twelve fifty or over; only one in one hundred and eleven is over seventy. Nearly all in the prime of life! They average much younger than the English contingent, where fifty-four per cent. were under forty, against our seventy-five per cent.—though the majority of them, too, are in the prime of life. The German tramp, like the English, is older than ours; sixty-one out of every one hundred being under forty, against our seventy-four and the English fifty-four.

WHAT SHOULD BE DONE.

Professor McCook concludes his paper by making the following practical suggestions:—

1. Stop lodging tramps in police-stations. Tramps are paupers. Why should they, any more than any other pauper unconvicted of crime, be kept in a cell in the company of criminals?

2. If we must keep them in the police-stations, separate them from the criminal section. And let the place be clean, well ventilated, and free from vermin.

3. Of two things one: Inspect every applicant and lodge the vermin free apart from the others; or cleanse and disinfect every garment with hot steam, furnishing a bath and a sleeping garment for the night. This is successfully done in the English Casual Wards. The public health requires it, and so does a decent regard for the little group of honest unfortunates who are conceivably mixed up with the great horde of the lazy and vicious. And let the town doctor be on hand every evening, to inspect all the lodgers and to order the detention of those who have contagious disease.

4. Adopt a careful system of registration. The German

Labour Colony, though a private institution, does not shrink from this, and requires the noting of eighteen different items, including physical peculiarities.

5. Require a pass-book and stamp upon it, date and place of lodging. Repel the applicant on transgression of certain conditions as to the period of return, and arrest him on transgression of others.

6. Wherever these people are lodged require labour of some kind as an equivalent. Why should a man be allowed to spend what he has begged or earned, on theatre or drink or licentiousness, and then be taken in for free lodging at public expense?

7. Let communities or counties join together and establish labour-stations where every honest applicant may find temporary occupation and not be obliged to choose between starving, begging, and stealing.

8. Let them join also in founding places of detention, under whatever name, to which incorrigible vagrants may be committed for indeterminate periods, and where they may both learn to work and overcome the habit of idleness. It is a habit easy to acquire and hard to get rid of.

9. So move public opinion that all the States may presently be under uniform vagrant laws and covered by a network of labour-stations under general management, to the end that the genuine man may never be driven to far and bitter wandering, and that the fraud may never wander so far but that he shall be finally caught and surely sifted out.

10. Get people to stop absolutely giving little coins to beggars. If they must needs make themselves "feel good" at small outlay, let them seek out some fashion less expensive to others.

11. Experiment with the drink question until you find some way of interfering with the present *ad libitum* manufacture and *ad infinitum* prolongation of that whole noisome and unhappy breed of which the tramp is only one variety.

A GOOD WORD FOR WINDOW GARDENING.

MRS. MARGARET C. BELL writes to me as follows:—

One is often struck painfully by the bleak, monotonous, and depressing aspect of many narrow and often sunless streets in the poorer parts of towns, especially where unrelieved grey stone is the material used, as in our northern cities. I think much might be done by a more lavish and systematic use of the coloured tile window boxes that the market supplies, which would manifestly make a transformation towards cheerfulness alike to the dweller and the passer-by. Were landlords to supply these to the houses and tenements, it would probably even benefit themselves in rendering their property more pleasant looking, and, therefore, more lettable. I would recommend the colours to be chiefly warm in hue—reds, marone, buff, etc., but not excluding pale blue. Positive colours would probably look harsh and would also interfere with the effect of the flowers. Cool colours might be best for brick houses where the prevailing tone is warm.

As to the plants, there need be no difficulty in growing greenery of kinds likely to thrive in such situations. The more careful occupier could have many a showy display to gladden all hearts by their purity and brightness. Gardeners, through the greengrocer, could supply the *proper* mixture of soil at a very trifling cost, the want of which is a common source of failure in window gardening.

Among the many suitable and easily grown flowers I might name nasturtium and lobelia, with cerastium or snow-in-summer, Virginia stock, Saponaria calabrica, marigolds, etc. Climbing plants to be trained round the windows where it is not too windy and the tenant take sufficient interest. Even in the desolation of winter, and where tenants are heedless, the colour of the tiles would still be a telling relief to the aspect of the streets.

The story of the girl in a shaded back court of London who had a potted plant that she walked up and down with in the sun to keep it in life, and my own recollection of early delight in the growth of a bean and the treasured bit of mint that grew in a bottle of water, make me certain that the co-operation of the most of children would be given.

SUNSHINE IN THE WORKHOUSE.

A PLEA FOR BOOKS AND PICTURES.

MAY I once more remind any of our readers who may be preparing for their annual exodus that it will be a good thing if, before they depart on their holidays, they could spend an hour in putting together the surplus literature of their bookshelves and cupboards, especially illustrated magazines and newspapers, in order that while they are enjoying themselves in the country and on the Continent, they may minister from the superfluity of their possessions to the happiness of the lonely and sometimes squalid lives of their poorer fellow-citizens. A postcard to the Free Literature Society, Bouverie House, Salisbury Square, E.C., would secure the removal of any parcels of reading matter which they may be disposed to hand over to the society for the distribution of reading matter to the workhouses.

THE MONTHLY MAGAZINE PARCEL.

The Free Literature Society collects from publishers and from the public back numbers of magazines and other periodicals for the purpose of distributing them throughout the country to the institutions that need them. Any Union that cares to subscribe two guineas per annum to defray the cost of carriage and of collection, receives every month a parcel of miscellaneous literature of the value of one guinea. That is to say, the Free Literature Society undertakes to supply to any contributory Union, periodicals and books, published at twelve guineas, for the annual subscription of two guineas. As it costs the society on an average 24s. per annum to forward the parcels to the Unions, this leaves only 18s. a year for cost of collection, etc., in London. There are some five or six hundred Unions in the country, but so far we have only 180 subscribers on our books.

HOW TO COLLECT OLD PAPERS.

I venture to repeat a useful hint for those who wish to take this matter up practically. Wherever the master of the workhouse supplies firewood to the householders, there exists, ready to hand, an agency which if utilised for collecting reading matter would more than supply the literary needs of the Union. All that is necessary is to do as is done to-day in Cardiff, viz., to supply every well-to-do householder, who takes firewood from the workhouse, with a stout canvas bag and a printed request that all literary lumber, in the shape of old newspapers, magazines, and books, should be dumped into the bag, which the workhouse messenger could clear when he delivered the weekly bundle of firewood. By this means there are few workhouses that could not secure a perpetual supply of newspapers. In places where the workhouse does not supply firewood, one or two collecting boxes with glass fronts, set up in conspicuous places near the railway stations, will as a rule secure what is needed.

PICTURES FOR THE WALLS.

Another branch of this subject is dealt with by Miss Edith Ward, of Eldon Buildings, Manningham Lane, Bradford, who writes as follows to the local papers. Her suggestion is much more needed in other Unions than Bradford, where the walls of the workhouse are by no means badly supplied:—

It has occurred to me that there are very many drapers, grocers, tobacconists, and newsagents in this town who have on hand a varied assortment of picture-frames which have been supplied in various ways for advertising purposes, and which have become obsolete, or from other causes are merely lumber to the trader concerned. Then there are many people who buy special numbers of the illustrated papers and magazines with coloured supplements who never think of using these for their own wall decoration, and the pictures (many of them of considerable merit) are destroyed or sent to various institutions, which their fragile condition prevents them permanently beautifying. Now, if those of your readers who have either

spare frames as described or spare pictures will send them to me, or advise me by post-card where I can send for them, I will very gladly undertake the work of fitting the pictures into the frames, and see that they are sent to the following institutions, where I think they would be heartily appreciated, viz., the Infirmary, Workhouse, Children's Hospital, Eye and Ear Hospital, Women's Shelter, and Cancer Home.

I think in these days of artistic homes, the bare walls of those places, where so many unfortunates are compelled to pass days and perhaps years of suffering and monotony, stare rather reproachfully at the visitor, or, if they bristle with rather gaudily coloured texts, they are hardly more cheerful to contemplate when one remembers the way in which some particular phrase will often enter the convalescent brain and worry the sufferer for days together. Who will help? Even frames of which the glass is broken would be acceptable, if otherwise firm and strong, as the glass can easily be renewed.

BOOKS FOR ASYLUMS.

We have hitherto confined our efforts for the most part to the supply of literature to workhouses. If, however, we may believe the Commissioners of Lunacy, the need for reading matter is not less great in Lunatic Asylums. When we remember that most lunatics are quite sane upon most subjects, what are we to think of the humanity which leaves them for years with nothing to do and nothing to read? The *Daily News*, noticing this subject in connection with the last report of the Commissioners, says:—

The Commissioners of Lunacy are not satisfied with the provision made in asylums for the literary cravings of their patients. In one of these institutions visited by them they could not find any books beyond a few odd volumes or parts of volumes. In the male ward, however, their search was rewarded by the discovery of a story entitled "A Careful Housemaid," but this did not strike them as likely to attract many readers. In another asylum they found neither newspaper-desks nor book-cases, nor indeed much need for them, for the entire mental food provided for seventy to ninety patients was one copy of a daily newspaper. As the Commissioners observe, "besides the weekly or monthly periodicals, books of an entertaining kind are cheap enough in these days, and it should be the duty of some person to promote circulation of the books and papers, and to encourage perusal of them by the patients."

THE PRIZE CALENDAR FOR JULY.

The prize this month is won by—

1. Miss M. A. Holloway, Lochbuie House, Isle of Mull, Scotland.
- The next best in order of merit are—
2. Miss Jessie Hay, 33, Abbey Street, Elgin, Scotland.
3. Miss R. F. Thompson, Castle Hill House, Settle, Yorkshire.
4. Miss Elise Le Huquet, S. Martin, Jersey.
5. "Veritas," 3, Avoca Terrace, Blackrock, Dublin.
6. W. Culling Gaze, Fengate, Peterborough.
7. Mr. George Wright, Ings Road, Barton-on-Humber.
8. Miss N. Edwards, Park Farm House, Eltham, Kent.

Owing doubtless to this season of the year being devoted to holidays, not nearly as many Calendars have been sent in as usual. We therefore restrict ourselves to the mention of the first best eight instead of the usual dozen.

I am sorry to say that the prizes offered in connection with the Pilgrimage and the Civic Church have not evoked much competition.

The prize of a guinea for the best story having the pilgrimage as its incident is awarded to Mrs. Skey, 3, Grove Hill, Forest Hill, London.

The prize of a guinea for the best lantern lecture and slides sent in is awarded to Mr. Hall Griffin, 35, Greencroft Gardens, N.W.

With the exception of the Calendar, prize competitions do not seem to draw the readers of the REVIEW.

Professor Mavor in Canada.

PROFESSOR JAMES MAVOR, late of Glasgow, who had a leading share in drawing up the report of the Glasgow Civic Centre on Labour Colonies, has not been allowed to remain long in his new home in the New World, before he has been put down to contribute by an American editor. The *Annals of the American Academy of Political and Social Science* publishes a paper on "The Relation of Economic Study to Public and Private Charity." His purpose is to answer the question, "Of what avail is the study of economics in the practical work of dealing with the problems of poverty?" After describing poverty as the condition of those who live at a low level, whose food, clothing, and shelter are relatively inadequate—for they were absolutely inadequate, those who found themselves in that condition would perish—inadequate relatively to the resources and consumption of those who are living at a higher level," he gives an interesting account of two of the methods which have been used to investigate poverty, namely, those of Le Play and of Charles Booth. Professor Mavor then takes up some of the schemes which have been tried for outdoor relief, such as the National Insurance system of Germany and the National Pension schemes of Mr. Chamberlain and Mr. Charles Booth. The final conclusion he draws is that "where economic students may most efficiently be of service in practical problems is in thoroughly and systematically mastering the conditions. Be it ours to study, and, so far as we may, interpret the facts as we see them."

The English Land Colonisation Society.

To the Editor of THE REVIEW OF REVIEWS.

Sir,—The interest which has lately been taken in the question of labour colonies and the unemployed, may lead to much waste of money unless any steps to be taken are carefully considered in the light of previous experience. This society has therefore been formed by persons interested, to collect information upon the matter, and to support as far as possible efforts, whether made by boards of guardians or others, provided they are on a practical basis. A pamphlet we have just published on farm labour colonies and farm settlements, gives an impartial summary of what experience has so far shown can be attempted with probable success.

I am, however, trespassing upon your columns to ask whether any of your readers could favour me with their opinions, either in writing or in printed articles, upon any foreign colonies and their method of working. We are forming a reference library of all English and foreign publications and reports bearing upon the matter, which we hope to make as complete as possible. We have reports, criticisms, and suggestions upon some of the German Farm Labour Colonies, and upon the penal settlement of the Dutch Government, which members of our Committee have inspected; but there are colonies in Austria, Switzerland, and others more recently established in France and Belgium, concerning which we have but little information, and with some of which your readers may be acquainted, and could favour us with their opinions upon.

As it must be recognised that the introduction of industries is an essential to financial success, in order that time not wasted on landed labour can be fully used, we are also considering this matter. Various suggestions for industries not now in operation in England are under investigation; and I should be glad to be favoured with any further suggestions from any who have given consideration to this matter, and who have practical ideas upon the subject. Any information we are able to collect will be at the disposal of all who are thinking of taking practical steps in that direction.—Yours faithfully,

J. C. KENWORTHY,

Hon. Sec. English Land Colonisation Society.

41, Bedford Row, W.C.

A Plea for Improved School Seats.

THERE is an important article in the *Humanitarian* for September by the Rev. J. Rice-Byrne on the "Effects of Posture of School Children."

What are the defects in the present arrangements? There is no back to the seat, or not a suitable back. The seat itself is narrow, perhaps, and flat. It is too high or too low for the sitter. The desk is too high or too low, too near or too far off. There is nothing to rest the feet upon, so that they either dangle, or are twisted round each other, or round the legs of the chair, or are put here or there or anywhere. The new arrangements must remedy all these defects.

(1) There must be a back, and a suitable one—suitable, that is, for study (and for different kinds of study, reading, writing, drawing, needlework), and for rest, when the student is tired.

(2) The seat must be tolerably deep (one secret of comfort in a seat) and slightly hollowed out: a saddle-shape, I believe, is the best. It must be adjustable to the height and occupation of the scholar.

(3) The desk or table. "The edge of the table" (Mr. Liebreich says), "is always to be perpendicular to that of the seat," and it "should have an inclination for reading of about 40 degrees, for writing 20 degrees." The desk should be adjustable, according to height and occupation.

(4) There should be a footrest, which also should be movable like everything else.

Workshops for Discharged Prisoners.

SIR BENJAMIN RICHARDSON, in the *Humanitarian* for September, recalls the fact that discharged prisoners in the seventeenth century used to be employed at a factory called the Oracle, in Reading. He suggests that we should revive the Oracle for the benefit of discharged prisoners.

In every large manufacturing centre there should be opened, by a public company or by private enterprise, factories or workshops, in which various occupations should be carried on that could be exclusively conducted within the walls of the establishment. The ordinary rate of wages should be given to the employed, and the workmen should be treated, so long as they themselves behaved well, with the same respect as other workmen. The great condition for obtaining work should be the mere application for it, without a word or a question as to who the man may be, where he came from, or what have been his antecedents. If such were carried out, it could hardly fail to bear good fruit.

Sir Benjamin may be quite right, but when so many honest men who have never been in gaol find it almost impossible to get work, how can we always provide work for the discharged convict?

Professor Huxley as a Christian.

THE editor of the *Andover Review* is so delighted with Professor Huxley's last discourse that he almost welcomes him within the fold of the Christian Church. After setting forth Professor Huxley's vices, he says:—

Professor Huxley does not look beyond the progress of the race, and fails to recognise man's religious nature does not impair the force of that which he does admit and emphasise. Now that a distinguished evolutionist declares that human progress is moral, is in freedom under the law of love, is different in kind from physical evolution, all is conceded that is essential both for ethics and for religion.

In the *Homiletic Review*, Dr. J. W. Hegeman, of New York city, continues his survey of the social work of the Salvation Army in London.

THE POLICE AND THE CLOTHING OF CHILDREN.

WHAT IS BEING DONE IN THE MIDLANDS.

I AM glad to hear that the Edinburgh scheme of using the police to secure the clothing of the children of the very destitute is about to be tried in Birmingham.

THE REV. W. J. CLARKE.

The Rev. W. J. Clarke is the moving spirit in the matter. He has read, both at Walsall and at Birmingham, a paper on "The Police Force as an agency of practical Christianity in relation to the clothing of poor children." In this paper he pointed out the importance of this question, as there was no sadder feature in the life of great cities than the privations of the poor children in autumn and winter. Often child-life was simply a prolonged agony; and if anything could destroy his belief in the Divine love it would be this. No sooner, however, did they try to right the wrongs of the child than they ran the danger of encouraging drunkenness and want of thrift, which would bring about the very misery and poverty they wished to remove. Still the idea of doing nothing was brutal in the extreme. In the REVIEW OF REVIEWS there had recently been a description of a scheme in Edinburgh carried out through the police. He believed it one of the wisest philanthropic efforts yet devised, and that the objections to it were of the least possible size. Captain Henderson, Chief Constable of Edinburgh, had told him that out of between 700 and 800 cases only three or four had been found of abuse. It was gratifying to know that Captain Henderson and everyone associated with the effort spoke in the highest terms of the scheme as worked in Edinburgh last winter. He expected that they would have objections from those who were doing nothing, and from those also who were doing something for the poor, and seemed to be jealous of everyone else. He expected that they would have objections too from some political economists, of whom they often heard too much. Often the poor were made so through no fault of their own; but those political economists never took any thought or notice of that. He was sure that in striving to act in the spirit and methods of Jesus Christ they were making the greatest and noblest step towards solving the great problem of the poor.

WALSALL.

At Walsall, on July 24th, a monthly meeting of the Dissenting ministers of Warwickshire and neighbouring counties was held at the Y.M.C.A., Walsall, the Rev. P. Dean (Walsall) presiding. Among those present were the Revs. W. J. Clarke (Birmingham), A. W. Workington (Stourbridge), J. C. Street (Birmingham), H. Eachus (Coseley), A. H. Shelley (Dudley), H. McKean (Oldbury), A. E. O'Connor (Cradley), and E. D. P. Evans (Kidderminster). A letter was read from the Chief Constable of Walsall stating that he could not be at the meeting, but he would give any assistance he could to any scheme which might be arranged on the paper. After the Rev. W. J. Clarke had read his paper an interesting conversational discussion followed, in which it was pointed out that though it was impossible to prevent all abuses, the Edinburgh system reduced them to a minimum, and had also a good effect even on vicious parents. The work was also stated to be one which the police could do without interfering with their present duties, and one which they would be glad to undertake. The Rev. W. J. Clarke said that the Birmingham superintendents had all expressed that view.

BIRMINGHAM.

On August 12th a meeting was held in the Assembly

Room of the Temperance Institute, Corporation Street, to consider a proposed police-aided scheme for clothing destitute children. Among those present were Councillors Lancaster and Dexter; Messrs. J. Rogers, Senior Fothergill, W. H. Ryland, E. L. Tyndall, Superintendent Willcox, the Revs. J. C. Street and W. J. Clarke, Mrs. Philp, Miss Cadbury, Miss Kenward, Miss Cockburn, Miss Gittins, Miss F. M. O'Neill, etc.

After Mr. Councillor Lancaster, who was in the chair, had expressed his sympathy and approval, Mr. Clarke explained what it was proposed should be done, and suggested that the experiment should be tried in Birmingham, a limited area being selected by way of experiment, and any action in the direction of covering the whole city being regulated by the experience which would thus be gained. A long and extremely interesting discussion then took place, in which Miss Cadbury, Miss Kenward, Councillors Lancaster and Dexter, Mr. Tyndall, Mr. Ryland, Mr. Rogers, and the Rev. J. C. Street took part. Superintendent Willcox, who represented the Chief Constable, in the latter's unavoidable absence, assured the meeting that all the assistance that could reasonably be expected would be gladly rendered by the police. In the course of the discussion the Rev. W. J. Clarke referred to the objections which had been urged against the scheme by the Rev. Benjamin Waugh. Mr. Clarke asked if we were to acquiesce in the perpetuation of a cruel and certain wrong, lest in trying to remove it we should be doing some purely problematical mischief. Ultimately the following resolution was moved by the Chairman, seconded by the Rev. J. C. Street, and carried unanimously:—"That those present hereby resolve themselves into a preliminary committee for the purpose of putting the Edinburgh Police-aided Scheme for clothing poor children into operation in Birmingham, in such district as may be deemed most suitable, with the view of deciding by the experience this experimental effort may yield, whether an association shall ultimately be formed with the object of covering the whole city."

The Editor as a Terrestrial Providence.

EDITORS are appealed to, to do all manner of things by their readers, but in all my wide and varied experience of the expectations which readers entertain of editors, I do not remember having come across a more extraordinary appeal than that which reaches me from Oak Cottage, North Street, St. Albans, Christchurch, Canterbury, New Zealand. This good man, apparently because he was injured in a coal-pit in Durham county when a boy of nine, some thirteen years before I was born, writes me a long letter, in which he asks me to get him an organette about four times the size of the reed pipe clarions, a New York instrument which he has seen in New Zealand, and would like to have as a means of earning his living. He has tried a piano organ and a German organ, but the oscillation of the cart breaks them up, and there is nobody to repair them, and therefore he would like very much if I could assist him to obtain this reed-pipe organette. As an inducement to add to my other duties that of providing barrel-organs to Englishmen in distress at the Antipodes, he kindly promises to travel and sell my papers all through New Zealand and Australia, provided that I let him have a double set of reeds and cog-wheels handy to be ready in case of a breakdown. I shall be very glad if any one can help Mr. Joseph Howard. There are limits to all things, and I draw the line at barrel-organs of any shape or kind.

THE NEW BOOKS OF THE MONTH.

NOTE.—For the convenience of such of our readers as may live at a distance from a bookseller, any Book they may require, mentioned in the following List, will be forwarded post free to any part of the United Kingdom, from the Publishing Office of the REVIEW OF REVIEWS, 125, Fleet Street, on receipt of Postal Order for the published price of the Book ordered.

ES, JOHN W., M.A. *Folia Litteraria: Essays and Notes on English Literature.* (Seeley.) Crown 8vo. Cloth. p. 367. 6s.

Professor Hales is an excellent example of the type of one who combines an exact and scholarly knowledge of subject with wide sympathies and appreciation, and excellent style. Slight though some of the papers in volume are, they are never unimportant: the short ones for instance on obscure points relating to Chaucer and Milton are of the greatest value to the student, and certain skill of presentment are made not a little interesting to the general reader. But the longer articles really make the most general appeal; and of these upon "Victorian Literature," an amplification of lectures delivered at the Royal Institution, will be most eagerly read. It is a survey almost entirely satisfactory. Professor Hales has gone to the very root of his subject, seeking in the social and political history of the period for the causes which made Victorian literature, rather than being content superficially to examine its characteristics. The literature of the nineteenth century mirrors, he thinks, "a period of great discontent and uneasiness, of aspirations and strivings, of death pains and birth pangs; and a broadening and deepening of its interests and sympathies has been its supreme distinction. It is a great literature, too, for although Professor Hales hardly mentions the literature of to-day, he comes to the conclusion that the present is an age of great intellectual activity, and that "never before have lived at the same time so many writers, both of prose and poetry, of such liberality and skill." An important paper is that upon the Last Decade of the Last Century," in which are considered certain tendencies and changes—the growth of democratic influence being, perhaps, the most important; and the attitude towards external nature an important sign—which were, and are, so potent in changing the course of modern literature. Other important articles are those upon "Old English Metrical Romances," the comparative importance of Wyatt and Surrey forming the metrical taste of their countrymen, "The rival of Ballad Poetry in the Eighteenth Century," and Milton's "Macbeth," in which Professor Hales discusses a drama which Milton proposed to write on the story of Macbeth. Milton apparently was dissatisfied, both on historical and ethical grounds, with Shakespeare's treatment of his theme, and contemplated dealing afresh with the subject in a poem which would pay more attention to historical accuracy, and which would show the shame of Macbeth's fall more strongly than it is shown in Shakespeare's tragedy, in which the human and pathetic, rather than the sinful, side is presented. The many brief notes which the volume also contains are all important to the student, and help to make it something of a commentary to the whole course of English literature. "Folia Litteraria" is an interesting book; and above all, it is the work of a scholar.

HOSKEN, JAMES DRYDEN. *Verses by the Way.* (Methuen.) Crown 8vo. Cloth. Pp. 81. 5s.

When Messrs. Macmillan published last year Mr. Hosken's two Shakespearian dramas, "Phaon and Sappho" and "Nimrod," a good deal was made of the fact that their author was a rural postman who had triumphed over all the exceptional hardships of his career, and had qualified himself by close study to produce verse of exceptional merit. But these dramas were so obviously based upon Elizabethan models that it was impossible to gauge from them Mr. Hosken's ability: work fresher and more spontaneous would be necessary before he could be accepted at the high estimate of some of his admirers. Well, now that "Verses by the Way" has appeared, what is one to say? Mr. Quiller Couch, who prefaces the volume with a perhaps unduly enthusiastic critical and biographical introduction, answers the question by hailing Mr. Hosken as "a true poet," and the author of at least one "gush of pure melody that Shelley would not have disdained." Personally we can but say that Mr. Hosken still leaves us cold: that he has plenty of talent is not to be denied, and an unusual gift of poetical description; but his verses are not musical and have little of that essential fire so necessary to the poet who does not desire that his appeal be purely intellectual. Some of the sonnets in the sonnet-sequence, "Via Amoris"—"The Afterlight," "Old World Dreams," and "The Order of the World" in particular—will bear re-reading; occasionally in the lyrics one comes across a well-turned line, a graceful thought; and there can be little doubt that in "Robin Hood" Mr. Hosken has made a real success, and has caught something of that charm elsewhere so sadly missing in his work, but, on the whole, the volume is too formal, too derivative, too little personal, to give its author any decided position.

PARKER, GILBERT. *Mrs. Falchion.* (Methuen.) Two volumes. 21s.

It is not easy to enjoy the reading of Mr. Gilbert Parker's new story. The obscurity which did so much to mar the excellence of "Pierre and his People" is again present, and it is even more vexing when applied to work of the length of "Mrs. Falchion." The first chapters in particular are too enigmatic, and their arrangement is hardly adroit. And yet the novel is very much above the average: it is thoroughly original; it contains many scenes of great dramatic power; and the character of Mrs. Falchion, from her first appearance on the Australian liner, where she refuses to recognise the husband who has brought shame upon her, through his persecution of her old lover, to her final awakening and repentance, is drawn with very great skill. Galt Roscoe, too, the naval officer who turns clergyman, and who is dogged by the shameful memory of a past, in which he has treated a Samoan girl in much the same way as Wiltshire in the "Beach of Felesá" was to have treated Uma, is an interesting figure. For the rest we need only say that the story contains some good Canadian scenes, and that it shows that Mr. Parker is not yet as proficient in the novel as he is in the short story.

BIOGRAPHY.

COLLINS, JOHN CHURTON. Jonathan Swift: A Biographical and Critical Study. (Chatto and Windus.) Crown 8vo. Cloth. Pp. 280. 8s.

The interest in Dean Swift, if one can judge from the number of volumes on his work which have lately made their appearance, is much on the increase. Mr. Churton Collins apologises for adding yet another volume to the already long list, but he claims to have spent upon his subject much careful study, and to be able to add somewhat to our knowledge. "I hold," he says, "no brief from Swift, but I have endeavoured to do him justice when justice has been either withheld or too grudgingly allowed. I have endeavoured to vindicate the consistency of his political principles, his character in all that related to practice and duty as a Churchman, the purity of his motives as well as his wisdom as an Irish agitator, and his conduct with regard to Stella and Vanessa." From which quotation it can be seen that the interest of the book is not a little polemical.

LAWRENCE, W. J. Barry Sullivan. (W. and G. Baird.) Paper Covers 1s.

MALLESON, COLONEL G. B., C.S.I. Rulers of India: Lord Clive. (Clarendon Press, Oxford.) Crown 8vo. Cloth. Pp. 225. 2s. 6d. With Map.

A workmanlike and readable biography of a man whose life has already received so much attention that it was hardly to be expected that Colonel Malleson would be able to add anything to the general knowledge. Without a volume on Clive, however, the Rulers of India Series would have been incomplete, and Colonel Malleson was no doubt the writer best fitted for the task.

ESSAYS, CRITICISMS AND BELLES-LETTRES.

CARPENTER, WILLIAM BOYD, D.D. The Message of Tennyson. (Macmillan.) 8vo. Paper Covers. 1s.

A sermon which the Bishop of Ripon delivered in Westminster Abbey on April 30 of the present year. It was both preached and published by request.

CRAIK, HENRY, (Editor). Swift: Selections from His Works. Volume II. (Clarendon Press, Oxford.) Crown 8vo. Cloth. Pp. 488. 7s. 6d.

Readers will find that this volume, with that preceding it, which contains an excellent life of the Dean by Mr. Craik, will make the best of introductions to Swift's voluminous works. For the Editor to have included everything that every devout admirer of his subject would wish would be of course impossible, but he has made a very wise and adequate selection, giving the reader a clear and complete view of the different sides of Swift's genius. The present volume contains, *inter alia*, three tracts on religion, four Irish tracts, "Gulliver's Travels," and a selection from his later poems. The large number of notes will be of very great use to the student.

DAVIES, WILLIAM (Editor). The Literary Works of James Smetham. (Macmillan.) Crown 8vo. Cloth. Pp. 288. 5s.

A volume of the Eversley Series, which may, as the editor says, be considered supplementary to the edition of Smetham's "Letters" which Messrs. Macmillan published some months since. It contains three essays—on Sir Joshua Reynolds, William Blake (a paper which is among the most notable contributions to Blake criticism), and Alexander Smith—which Smetham contributed to the *London Quarterly Review*, and one upon Gerhard Dow from the *Art Journal*. Some forty pages at the end of the volume are devoted to Smetham's poems.

DELILE, EDWARD. Some French Writers. (Chapman and Hall.) Crown 8vo. Cloth. Pp. 221. 5s.

These papers, reprinted, with revisions and corrections, from the *Fortnightly Review*, make very interesting reading to any one at all acquainted with the trend of literary events in Paris of to-day. Mr. Delile has chosen for his subjects M. Paul Bourget, "Pierre Loti," "Bachelaire, the Man," "Chez Pousset, a Literary Evening," Guy de Maupassant, "The Poet Verlaine," "Card-Sharpping in Paris," and M. Maurice Barrès.

DUFF, E. GORDON. Early Printed Books. (Kegan Paul.) Large Crown 8vo. Buckram. Pp. 219. 6s. net.

A volume of the Books About Books Series. Mr. Gordon Duff's endeavour has been to give a short account of the introduction of printing into the principal countries and towns of Europe, and to bring our information on the subject as far as possible up to date. In doing this he has attempted rather to draw attention to out-of-the-way information than to recapitulate what is already to be found in the majority of bibliographical books; and he has tried as far as possible to confine himself to facts and avoid theories. The book contains some very excellent reproductions of examples of early printing.

HEINE, HEINRICH. The Salon; or, Letters on Art, Music, Popular Life and Politics. (Heinemann.) Crown 8vo. Cloth. Pp. 453. 5s.

The fourth (and, in order of issue, as the four following volumes have already appeared, the last) volume of Heine's prose works which Mr. Charles Geoffrey Lealand has been translating, and Mr. Heinemann has been publishing for some time past. The book contains Heine's letters on the Salon, including criticism of the work of Ary Schaffer, Horace Vernet, Delacroix, Desamps, and Delaroche; his confidential letters addressed to

M. August Lewald on the French stage; articles on George Sand; and letters on music in Paris between 1840 and 1847. The series is to be continued in four volumes devoted to Heine's poetical works, the first being "The Song of Songs."

MERRIMAN, HENRY SETON, and STEPHEN G. TALLENTIRE. From Wisdom Court. (Heinemann.) Crown 8vo. Cloth. Pp. 206. 3s. 6d.

A very entertaining series of brief humorous essays on different subjects, and, in truth, hackneyed subjects. But the authors have managed to be genuinely amusing, and the collection makes an almost ideal book for holiday. In Mr. E. Courboin, Mr. Heinemann has made a distinct discovery: his thirty sketches are in many ways the best illustrations of their class that have been: they are really decorative, and original in treatment.

RUSKIN, JOHN. Three Letters and an Essay. (George Allen and Unwin.) Crown 8vo. Cloth. Pp. 93. 3s. net.

This volume, published for the benefit of Malling Abbey and the preservation of ancient buildings, contains a school-boy essay written by Mr. Ruskin in 1836, on the question whether or no "the perusal of works of fiction is favourable or unfavourable to the moral character," and three letters, from Rome, Lausanne & Leamington, written in 1840 and 1841. Intrinsically the book has no value; but it is interesting as giving a first glimpse of the mature genius who was subsequently so profoundly to influence modern thought.

The Prose Works of the Rev. R. S. Hawker, Vicar of Morwenstow. (Blackwood.) Crown 8vo. Cloth. Pp. 187. 3s. 6d.

A collection of articles upon North Cornish legends and customs, most of which Hawker contributed to *Notes and Queries*, *Household Words*, *All Year Round*, etc. Many of them have already appeared in "Footsteps Foreign Men in Far Cornwall"; some are now published for the first time but all have a very great charm and are written with admirable directness. The paper entitled "The Remembrances of a Cornish Vicar," which Hawker narrates his experiences in Morwenstow, the wild Cornish parish, whose people had been demoralised by years of neglect, of smuggling and of wrecking, is full of interesting matter; and there are half-a-dozen papers dealing with the old smuggling days—a servant of Hawker's tale of having formed one of a band who, surprised by an excise-man, dragged him on to the boat, and in a spirit of revenge, chopped off his head the gunwale—and with wrecks which the author had himself seen, which should prove invaluable to the sensational novelist. A few of the papers are devoted to the folk-lore of the county—a subject which Hawker had his fingers' ends. One is glad to note that Messrs. Blackwood hope shortly to publish a similar volume containing Hawker's complete poetical works.

FICTION.

BLACKMORE, R. D. Lorna Doone. (Sampson Low.) Crown 8vo. Cloth. Pp. 517. 2s. 6d.

The first volume of a complete edition of Mr. Blackmore's novels, and in every respect, save colour, with the admirable and very cheap edition by Mr. William Black and Mr. Thomas Hardy which Messrs. Sampson Low & Co. are now publishing. As a frontispiece to the present volume is issued an excellent colotype portrait of Mr. Blackmore—the first, we believe, that ever appeared. The succeeding novels are to be published at most intervals.

BLACK, WILLIAM. The Wise Women of Inverness and Wh Heather. (Sampson Low.) Crown 8vo. Cloth. 2s. 6d. each. New editions.

BOWER, MARIAN. Paynton Jacks, Gentleman. (T. Fisher Unwin.) 8vo. Cloth. Pp. 315. 6s.

Paynton Jacks was the son of a catmeat man who had made money, and who had married a pale governess, who, being but "jerry built," had died giving birth to her son. The story turns upon the amount of success which attends the rich man's attempt to make his son a "real gentleman," fit "a hob-nob with swells." It is a brightly-written book, well conceived and more than a touch of dramatic power. Obviously the work of a beginner, it is not a little promising.

BRONTË, CHARLOTTE. The Professor. (J. M. Dent and Co.) Fcap. 8vo. Cloth. Pp. 292. 2s. 6d. net.

The seventh volume of the beautiful edition of the Brontë novels which Messrs. J. M. Dent and Co. are now publishing.

CRAWFORD, F. MARION. The Witch of Pragus. (Macmillan.) Crown 8vo. Cloth. Pp. 421. 3s. 6d. New edition.

A new volume of Messrs. Macmillan's three-and-sixpenny series, illustrated by Mr. W. J. Heffernan.

CROCKETT, S. R. The Stickit Minister and Some Common Men. (T. Fisher Unwin.) Crown 8vo. Cloth. Pp. 283. 5s.

To say simply that he is a follower of Mr. Barrie would be greatly to understate Mr. Crockett's claims. That he is somewhat indebted to the author of "A Window in Thrums" both for his subject-matter and his mode of treatment is at once apparent; but he is a great deal more than a mere imitator. Galloway ministers and Galloway peasants are the characters of these short skits here. At one moment Mr. Crockett has seized a pathetic, at another a comic episode; but whichever he has chosen, he has presented it with a rare art, a fine sense of literary finish, and a fidelity to nature which are hardly to be excelled. There is real humour, too, in some of the stories. Mr. Crockett

meritently studied the Lowland character both with care and affection, and his book is one which no reader who cares at all for that particular form of fiction which Mr. Barrie and "Q" have made fashionable should miss seeing.

DEAN, MRS. ANDREW. Mrs. Finch-Brassey. (Bentley.) Three volumes. 31s. 6d.

In spite of the lengthy silence which followed "Isaac Eller's Money," novel-readers had not forgotten that, in many ways, remarkable story. The comparatively slight "A Splendid Cousin" showed that Mrs. Andrew Dean was still to be reckoned with; and now the more ambitious "Mrs. Finch-Brassey" marks her out as a novelist in the front rank of women writers. It is a picture of provincial society, of the same class that Miss Anne loved to paint, that she gives us here. A certain leaning toward the portrayal of disagreeable characters, discernible in both her previous books, has made her choice for her central character the sort of scheming, designing man of whom, perhaps, Becky Sharpe was prototype, and Mr. Mariou Clarendon's Adèle Savelli the last example. That she occasionally forces the reader does not prevent this study being an excellent piece of characterisation; and the whole circle in which Mrs. Finch-Brassey moves and which she so deftly is drawn with equal skill. Of plot Mrs. Dean has very little: she has been almost content to present a society; and she does it admirably well, for there is not a character in the three volumes, from Joe Cromer, Lord Bettleby's agent, to Moulby, the linen-draper, whom the reader does not take a keen interest in, and whose personality he does not realise as life-like.

DOYLE, A. CONAN. The Refugees: a Tale of Two Continents. (Longmans.) Crown 8vo. Cloth. Pp. 384. 6s.

On its first appearance in three volumes this stirring romance of France and Canada under Louis the Fourteenth was praised enthusiastically in the *June* number of the *Review*, so that it is now sufficient to note that it has passed into a single volume edition uniform with "Micah Clarke."

DUNCAN, SARA JEANNETTE. The Simple Adventures of a Housemaid. (Chatto and Windus.) Crown 8vo. Cloth. Pp. 312. 7s. 6d.

When we say that this chronicle of Indian experiences is by the author of "A Lion's Den" and "An American Girl in London," that it is written with all the vivacity of those entertaining volumes, and that its plan is very well the same, we have said enough to commend it to all who care for light literature in one of the most pleasing of its latest phases. Mr. F. H. Townsend's drawings are, of course, excellent.

EDGEWORTH, MARIA. Belinda. (J. M. Dent and Co.) Two volumes. Fcap. 8vo. Cloth. 5s. net.

By her stories, said Sir Walter Scott, to acknowledge his indebtedness to the authoress of "Belinda" for the suggestion which brought forth the *Waverley* novels, "Miss Edgeworth may be truly said to have done more towards completing the Union than perhaps all the legislative enactments by which it has been followed up." "Waverley," in fact, was the direct outcome of a desire to do for Scotland "something of the same kind with that Miss Edgeworth so fortunately a hielver for Ireland." But that these Irish stories have been for some years falling into undeserved neglect was undeniable; and readers should be grateful to Messrs. Dent for including them in their beautiful series of reprints of standard fiction. The story is prefaced by a brief biographical introduction, and both volumes have, as frontispieces, reproductions of the original illustrations. Uniform in size and form with the editions of *Fielding*, *Peacock*, and the *Brontës* from the same house, Miss Edgeworth's novels are bound in a cover whose design—dark green shamrock leaves on a light green ground—gives a distinctly Irish impression.

GIFT, THEO. An Island Princess. (Lawrence and Bullen.) Crown 8vo. Cloth. Pp. 270. 5s.

Mr. Gift can write excellent fairy tales, but in this "story of six weeks—and afterwards" he has failed to write a good novel. A young English girl, living on a remote island in the Atlantic, has her heart broken by the perfidy of a naval officer, who wins her love only to go away and forget her. News of his marriage reaches her, and, going in her sorrow to mourn by the sea, she is accidentally drowned. It is an old story, and a pathetic; but Mr. Gift has treated it in a manner most diffuse. The characterisation is not good, but there are some pleasing descriptions of scenery.

GRAND, SARAH. Ideals: a Study from Life. (Heinemann.) Crown 8vo. Cloth. Pp. 269. 6s. Fifth edition.

GRIFFITHS, ARTHUR. My Peril in a Pullman Car. (Henry J. Drane.) Crown 8vo. Cloth. Pp. 212. 2s. 6d.

A collection of nine short stories, mostly dealing with railway adventures, by the author of "Chronicles of Newgate," etc.

HARDY, THOMAS. The Return of the Native. (Sampson Low.) Crown 8vo. Cloth. Pp. 412. 2s. 6d. New edition.

HOBBS, JOHN OLIVER. The Sinner's Comedy. (T. Fisher Unwin.) Long post 8vo. Paper Covers. 1s. 6d. Fourth Edition.

A reprint in the Pseudonym Library of Mrs. Craigie's second story.

HORNUNG, ERNEST WILLIAM. Tiny Luttrell. (Cassell.) Two volumes. 21s.

It is not in work of this class that the author of "A Bride from the Bush" is at his best: Australian bush life he has made his own in such short stories as "Sergeant Seth" and "Jim-of-the-Whim"; but when he brings his knowledge home he generally succeeds, if not in fatiguing, at least in irritating

his readers. Tiny Luttrell is too inconstant and variable, and too little life-like to really interest; and her successive love affairs with the manager of Wallandown and Lord Minister, whom she accepts, but who jilts her, only to propose again upon meeting her in England, are very tiresome. First she refuses him; then is uncertain, and takes a month, and then six months to consider; and ultimately marries the manager after all—but by the time this part of the story is reached the reader is sufficiently pleased to part company with Tiny Luttrell, not to mind much whom she marries. There is a deal of clever characterisation in the book, and some good writing, but on the whole the style is too restless to be really pleasant. Mr. Hornung should return in his next story to the bush.

MACALPINE, AVERY. Joel Marsh: an American. (Ward, Lock, Bowden, and Co.) Crown 8vo. Cloth. Pp. 263. 3s. 6d.

Were it not that so many volumes of short stories have lately come from America, all displaying the same qualities of skill in narration and characterisation, of reticence, of humour, and of pathos, this book might achieve some success. But English readers are dring of the tradition in which Mr. Macalpine works; and although there is much in his book that is admirable—the character of Joel Marsh; the little French tale of a daughter's lifelong devotion to a bedridden mother; and "A Sacrifice to Faith," a powerful story of a man's fanaticism in refusing to let his sick child have any other relief but that of prayer—it is not on the whole sufficiently original or remarkable to make it likely that it will gain the attention that fell to the lot of Miss Wilkins and her immediate successors.

MATHEW, FRANK. At the Rising of the Moon: Irish Stories and Studies. (McClure.) Crown 8vo. Cloth. Pp. 240.

Mr. Mathew has attempted to do for certain districts on the West Coast of Ireland what Mr. Barrie has done for Kierriemuir, and he has achieved a certain success. Certainly he has far less artistic ability, and his style is often slipshod, but he arranges his anecdotes—they are more anecdotes than stories—well, and the result is certainly a very readable book. These sketches made their first appearance in the *Idler*, and are now reprinted with the illustrations by Mr. Fred Pegram and Mr. A. S. Boyd.

NORRIS, W. E. The Countess Radma. (Heinemann.) Three volumes. 31s. 6d.

Mr. Norris's latest story commences so well that one is not a little sorry that he should have conceived it necessary to weaken his original motif by the superposition of various other interests which are certainly not indispensable, and which, while they amuse, greatly detract from the novel's strength and unity. The character of the rich Hungarian Countess, who, wed to an English county gentleman, and finding her life in England rather more dull than that to which she was accustomed, acted on her belief that there was no reason, social or religious, why bonds which have grown irksome and which unite a childless husband and wife should not be broken, is genuinely interesting. Her informal separation and subsequent reconciliation, when it was too late, are told of well but at too great length; and as we have said, the story suffers from its variety of interests. Mr. Norris, however, writes so excellently and is so clever an observer that one is almost pleased that he has spun out to the length of three volumes what might well have been told in one.

PAGE, THOMAS NELSON. In Ole Virginia; or, Marse Chan and Other Stories. (Ward, Lock, Bowden and Co.) Crown 8vo. Cloth. Pp. 230. 3s. 6d.

Mr. T. P. O'Connor, M.P., who prefaces these stories with a brief introduction, hopes that he will have gained many readers to share with him "all the pathos, grace, regret without bitterness, and tears without pain," that he has found in their pages. Most of the stories are in negro dialect.

READE, CHARLES. It is Never Too Late to Mend. (Chatto and Windus.) 8vo. Cloth. Pp. 254. 1s. Paper covers, 6d.

The paper on which this edition is printed is excellent, and the type, though close, is very clear. It is a wonderful sixpenny-worth, and all those whose purses have not before allowed them to make the acquaintance of what is perhaps Charles Reade's best work, and one of the finest novels of his generation, will be grateful to Messrs. Chatto and Windus for their generous enterprise.

SAINTSBURY, GEORGE (Editor). The Works of Henry Fielding. Volumes III., IV., V. and VI. (J. M. Dent and Co.) Fcap. 8vo. Cloth. 10s. net.

These four volumes of this excellent edition contain "The History of Tom Jones, a Foundling," and are illustrated by Mr. Herbert Railton, with etchings of Fielding's house at East Stour and St. Benet's, Paul's Wharf, where the novelist was married, and Mr. E. J. Wheeler, with twelve plates dealing with incidents in the story. In his introduction Mr. Saintsbury says that "Tom Jones" is "an epic of life—not indeed of the highest, the rarest, the most impassioned of life's scenes and phases, but of the healthy average life of the average natural man; not faultless or perfect by any means, but human and actual as no one else but Shakespeare has shown him in the mimic world." This will, no doubt, be the definitive edition of Fielding: technically it is near perfection, and Mr. Saintsbury is admirably equipped as an editor.

SCOTT, SIR WALTER. The Abbott. (A. and C. Black.) 8vo. Cloth. Pp. 453. 5s.

The twelfth volume of the new Dryburgh Edition of Scott, with ten illustrations by Mr. John Williamson.

Tavistock Tales. (Isbister.) Crown 8vo. Cloth. Pp. 254. 2s. 6d.

The best story in the collection is Mr. Gilbert Parker's "March of the White Guard," which is also considerably the longest; but Luke Sharp's "Sunshine Johnson, Murderer," "Lance Falconer's," "The Wrong Prescription"

tion," and Mr. G. B. Burgin's "The Man from the Four Corners," are all deserving of praise. There are eleven stories in all; and the volume is generously illustrated by Mr. Gordon Browne, Mr. W. D. Almond, and others.

Unwin's Novel Series. (T. Fisher Unwin.) Small 4to. Paper Covers. 1s. 6d. each.

A very well chosen and handy series of different well known novels that Mr. T. Fisher Unwin has published, and which he now reissues in a form similar in size and shape to the Tauchnitz Library. So far the volumes issued are Mrs. W. K. Clifford's "Mrs. Keith's Crime," Mr. T. Wemyss Reid's "Gladys Fane," Mrs. Andrew Dean's "Isaac Eller's Money," and Mr. G. Colmore's "Concerning Oliver Knox." Succeeding volumes will be published at monthly intervals.

HISTORY.

DWYER, REV. PHILIP, A.M. *The Siege of Londonderry in 1689, as set forth in the Literary Remains of Colonel the Rev. George Walker, D.D.* (Elliot Stock.) 4to. Cloth. Pp. 255. 16s.

Contains "A True Account of the Siege," "A Vindication of the True Account," "A Letter on the Treachery of Lundy," "Other Official Letters," and "Sermons, Prayers, and Speeches during the Siege," together with notes and numerous illustrations.

GREY, HENRY M. *Lloyd's Yesterday and To-day.* (John Haddon and Co.) 8vo. Cloth. Pp. 96. 5s.

An enlargement of a sketch which originally appeared in the *Illustrated London News*. A number of the illustrations are by Mr. W. D. Almond.

JOYCE, P. W., LL.D. *A Short History of Ireland from the Earliest Times to 1603.* (Longmans.) Crown 8vo. Cloth. Pp. 565. 10s. 6d.

Mr. Joyce, who hopes shortly to publish a further volume, bringing his history down to the present time, has adopted the plan of weaving his chronicle round important events and leading personages. His method, he says, has enabled him "to divide the book into short chapters, each forming a distinct narrative more or less complete in itself, and has aided in the endeavour to infuse some life and human interest into the story." The volume is divided into four parts: "The Manners, Customs, and Institutions of the Ancient Irish," "Ireland under Native Rulers," "The Period of the Invasion," and "The Period of Insurrection, Confiscation, and Plantation;" and it contains a good map and an index.

RAWLINSON, GEORGE. *The Story of the Nations: Parthia.* (T. Fisher Unwin.) Crown 8vo. Cloth. Pp. 419. 5s. Illustrated.

Professor Rawlinson has taken for his subject the history of the strong people who held together in one empire the various nations in and around Mesopotamia for a period of about four hundred years. That period fell between the brilliant outbreak of Alexander the Great and the rise of the new Persian kingdom, so that it answers to the most flourishing times of Rome and the Roman world. Considering that Parthia, almost alone of nations, held the power of Rome at bay, it is obvious that her story must be a striking one and her importance great. Professor Rawlinson has done full justice to this aspect of her history; but he has also traced in interesting detail her attitude to the Greek kings of Syria, to the Jews, and to the savages of Central Asia. He describes, too, the country, the institutions, and the monuments.

RENTON, WILLIAM. *Outlines of English Literature.* (John Murray.) Crown 8vo. Cloth. Pp. 248. 3s. 6d. University Extension Manuals.

A very fair outline of the history of English literature. Mr. Renton has, however, seen fit to encumber his work with a number of diagrams which are very difficult to understand, and which will certainly not help the student to a knowledge of his subject. The idea is ingenious, and may possibly have something to commend it, but it is altogether out of place in a work of this class.

LEGAL AND POLITICAL.

BELLOT, HUGH H. L., B.C.L., M.A. *Ireland and Canada: Studies in Comparative Constitutional Law and Politics.* (Reeves and Turner.) 8vo. Paper Covers. 1s. net.

Mr. Bellet believes that the lesson taught by Canada is invaluable as a precedent for the extension of Home Rule to Ireland, and that such extension, arguing from analogy, will meet with similar successful results.

MISCELLANEOUS.

SINCLAIR, ARCHIBALD, AND WILLIAM HENRY. *Swimming.* (Longmans.) Crown 8vo. Cloth. Pp. 452. 10s. 6d.

The authors of this new volume of the Balminton Library are the honorary secretaries of the Life-Saving Society, and they have certainly done their work very admirably, making the book one of the best in the series to which it belongs. Chapters are devoted to the teaching of swimming; the art of swimming; diving, plunging, and floating; scientific swimming; bathing in the open; life-saving; water-polo; the government of swimming; the universities and public schools; management of swimming meetings; training; and public baths. A very large number of excellent illustrations are by Mr.

S. T. Dadd; and some photographs are also reproduced. Altogether, the book is one for which all swimmers should be grateful: it will be the classic on the subject.

POETRY, MUSIC AND THE DRAMA.

DUNN, SINCLAIR. *Auld Scotch Sangs.* (Morison Brothers, Buchanan Street, Glasgow.) Paper Covers. Pp. 2s. 6d.

New popular edition of ninety-six old Scotch songs arranged and edited by Mr. Sinclair Dunn. Several of the songs have been arranged for duets for medium voices.

ELLIS, WM. ASHTON, (Translator). *Kunihild and the Ride on Kynast.* (Wm. Ashton Ellis, 33, Southam Street, Strand.) Paper Covers. Pp. 96. 1s. 6d.

This is an interesting opera-poem in three acts, written by Fodor Graf Sporck. A charming account of Cyrill Kistler, the composer, appears in a recent number of the *Messenger*, and we are now further indebted to Mr. Ellis for his translation of "Kunihild," which is printed as stage-manuscript.

ELTON, OLIVER, B.A. (Editor). *Milton's "Comus."* (Clarendon Press, Oxford.) Paper Covers. 1s.

A volume of the Clarendon Press Series. The introduction, the notes on the verse of "Comus" and on Milton's use of authorities, the names, and the glossary will all be of the greatest use to the student.

FARMER, JOHN, (Editor). *Dulce Domum.* (Cassell.) 2 Paper Covers. Pp. 70 and 60. 6d. each.

Rhymes (old and new) for children, with the airs in both notations.

GOODCHILD, J. A. *Lyrics.* (Horace Cox.) Fcap. 8vo. Cloth. Pp. 213. 5s.

Dr. Goodchild, from whose three volumes, "Sonnet Melodist," the present volume is mostly taken, is a minor poet too little appreciated. "If the author of these poems," said Tennyson, "to be one who is far more the mere follower of my own"; and the reader does not need to read more than the exquisite "A Dresden Beauty" and "Sister Seraphina" to see that the Laureate's praise was well merited. There is, indeed, quite an unusual amount of poems worth reading in this volume: it is far above the average of its class.

LEYTON, FRANK. *Skeleton Leaves.* (Longmans.) Crown 8vo. Cloth. Pp. 146. 6s.

In view of the many enthusiastic reviews which were given to the edition of this book, and which Mr. Leyton sends out with the second, we somewhat fearfully of expressing our real opinion. We can echo, however, the words of the *English Churchman* in saying that no doubt the poet's intentions are excellent.

MACKAY, ERIC. *The Royal Marriage Ode.* (Lamley.) Crown 8vo. Cloth. Pp. 53. 5s. net.

There is more than one other Richmond in the field, so that it is not surprising at Mr. Mackay calling his verses "The Royal Marriage Ode," justifiable. Although it contains some rubbishy verses, the ode is not all one: it is musical and properly enthusiastic, even if sometimes the words away with the sense; but it is hardly good enough to warrant the immediate appointment of Mr. Mackay as Poet Laureate. The volume's cover, and against most canons of good taste.

MILES, ALFRED H. (Editor). *The Poets and Poetry of the Nineteenth Century: Robert Bridges and Contemporary Poets.* (H. K. Mulholland.) Fcap. 8vo. Buckram. Pp. 714. 4s.

The task which Mr. Miles set himself is drawing to a close, and able students and general readers are finding of what great use is this anthology of nineteenth century verse. The present volume is perhaps the most interesting, dealing as it does with the generation of poets, many of whom are even now on the higher side of the zenith of their power, and whose achievement is so full of infinite possibility. The selection is not whole a judicious one, and the critical introductions sound and capable. Among the most important are John Todhunter, Ernest Myers, Andrew Lang, Ed. Hickey, George Barlow, Ernest Cracroft, Lefroy, Os. ar Wilde, John Donne and Rudyard Kipling, by the Editor; John Payne, Arthur O'Shaughnessy, Constance Nallen, by Dr. Garnett; F. W. H. Myers and Eugene Lee-Hamilton by John Addington Symonds; Edward Dowden, W. E. Henley, H. D. Rawns, Alice Meynell, William Sharp, Alfred Hayes, William Watson, Norman Macdonald and Richard Le Gallienne, by Mr. Ashcroft Noble; Robert Bridges, by Mr. Warren; Gerard Hopkins, by Mr. Robert Bridges; Graham R. Thomas, Mr. Richard Le Gallienne; Philip Bourke Marston, by Mr. Coulson Kernahan; Robert Louis Stevenson, by Mr. Cosmo Monkhouse; Michael Field, by Lionel Johnson; A. Mary F. Robinson-Darmesteter and Mrs. Ernest Rathbone by Mr. Arthur Symonds. These introductions are brief, and are in consequence sometimes too unqualifiedly enthusiastic; but the wonder is, not that this is so, but that it should have occurred so seldom. In the article, "Ac Etiam," Mr. Miles discusses some thirty poets, whose importance had not seemed to him to call for special treatment: in this chapter, however, we are surprised to find Mr. W. B. Yeats and Mr. Arthur Symonds, both deserving of selection. It is to be regretted that both in the case of Mr. W. E. Henley and Mr. William Watson leave to reprint has been denied, and only slight quotation has been possible.

LEWIS, M.A. *Ode on the Marriage of H.R.H. the Duke of York and H.S.H. Princess Victoria Mary of Teck, July 6, 1893.* (Kegan Paul.) 4to. Pp. 7. 1s. 6d. net.

The fact that Mr. Lewis Morris's name is so persistently coupled with that of laureateship gives this ode, which is published, by the way, "because an interest which it certainly would not otherwise have. It is, however, melodious and graceful, and has perhaps all the attributes to be expected of one published "by desire."

ROGERS, ALFRED. *Centenary Tune Book.* (Alfred Rogerson, Wainfleet.) Cloth. Pp. 208.

A selection of old Methodist tunes, with an Introduction by Mr. F. James.

NUTT, CHARLES. *Musa Consolatrix.* (David Nutt.) Crown 8vo. Paper covers. 3s. 6d. net.

A good deal might be said in qualified praise of this modest collection. It is sure, certainly, but it is the immaturity of promise, and the triviality of the verses does not prevent ample evidence that Mr. Sayie has a musical and a care for form and technique too rare among younger singers. Both "and" the sonnet on "Music" are powerful; but we think that Sayie would have been better advised to have postponed publishing until and more to say; by which time, too, his verse would perhaps have gained and depth.

ALIVAN, SIR EDWARD, BART. *The Comedy of Dante Alighieri Rendered into English.* (Elliot Stock.) Crown 8vo. Cloth. Pp. 180. 4s. 6d.

A prose rendering of Dante's "Comedy," designed by its author to aptly represent the original without entirely sacrificing the poetical which is so marked a characteristic of the work. An archaic, Biblical of diction has, as far as possible, been employed.

WARWICK SHAKESPEARE. (Blackie.) Fcap. 8vo. Cloth.

In this new edition an attempt is made to present the greater plays of the poet in their literary aspect, and not merely as material for the study of elocution or grammar. "Aesthetic judgments," says the general preface, "are final; but the editors have attempted to suggest points of view from the analysis of dramatic motive and dramatic character may be profitably taken." At present two volumes have been issued: "Julius Cæsar," edited by Mr. Arthur D. Innes, M.A. (1s.), and "Richard the Second," edited by Professor C. H. Herford, Litt. D. (1s. 6d.).

SCIENCE.

PROCTOR, RICHARD A. (Editor). *Nature Studies.* (Longmans.) Crown 8vo. Cloth. Pp. 342. 3s. 6d. New edition.

A collection from *Knowledge*, of which Mr. Proctor was editor, of twenty-four articles upon scientific subjects by Mr. Grant Allen, Mr. Edward B. Wilson, Mr. Andrew Wilson, Mr. Thomas Foster, and the Editor. In each case the authors have attempted "to bring scientific facts before the public in a clear but correct words, without perplexing readers, on the one hand, by scientific descriptions or technical terms, and without derogating, on the other, from the dignity of science." Among the most notable papers are: "The Dawn of Life," by Mr. Edward Clodd; "Honey Bees," "Hyacinth Bulbs," "The Daffodil," and "The Origin of Butter-cups," by Mr. Richard Allen; "Birds and Teeth," by Mr. Thomas Foster; and "Intelligence in Animals," by the Editor.

THEOLOGICAL.

OSKEY, HENRY W. LL.D., F.G.S. *A Hand-book of Rational Piety.* (Philip Green.) Small square. Cloth. Pp. 173. 2s. 6d.

Brief passages from printed and manuscript sermons delivered by the author during the course of a lengthened ministry. "It is possible," he says, "that brief passages from sermons may not be quite so unheeded as long ones themselves often are."

MAURICE, FREDERICK DENISON. *The Doctrine of Sacrifice Deduced from the Scriptures and The Prayer Book and the Lord's Prayer.* (Macmillan.) Crown 8vo. Cloth. 3s. 6d. each.

Two new volumes of the reissue of Maurice's writings and sermons, which Macmillan are now publishing. The sermons on the Prayer Book in the second of the two consider the subject especially in reference to the Romish system.

TRAVEL, GEOGRAPHY AND TOPOGRAPHY.

BERDEKN, THE COUNTESS OF. *Through Canada with a Kodak.* (W. H. White and Co., Edinburgh.) Crown 8vo. Cloth. Pp. 249.

A series of papers written by Lady Aberdeen during two tours in Canada, and published in *Onward and Upward* for the information and amusement of

the members of the Onward and Upward Association. "They are merely," says the author in her preface, "the passing and superficial notes of a traveller journeying rapidly through the country, and desirous of conveying some impressions of the rich and varied attractions presented by 'the Dominion,' and which appear to be but very imperfectly realised by those at home." Although they do not aspire to deal with the deeper questions of Canadian life and politics, these sketches make very interesting reading, and their value is enhanced by reproductions of a large number of photographs, the majority of which were taken by Lady Aberdeen herself.

ANSTED, DAVID T., M.A., and ROBERT G. LATHAM, M.A. *The Channel Islands.* (W. H. Allen and Co.) Crown 8vo. Cloth. Pp. 476. 7s. 6d.

Although this book has been out of print for some time, it has remained the standard work upon its subject. Mr. Toulmin Nicolle, its present editor, has made many alterations, bringing it up to date, adding much new matter and a number of illustrations, mostly reproduced from photographs, of the most beautiful scenes in the islands. The book contains maps and detailed descriptions of places; but it is not so much a guide-book as a monograph, for it is divided into four parts, dealing respectively with physical history, natural history, civil history, and economics and trade. As a supplement to the ordinary guide-book it will be invaluable to the tourist. It should be added that the volume contains a good index.

BACON, G. W., F.R.G.S. *The Up-to-Date Gazetteer and Atlas of the World.* (G. W. Bacon and Co.) Crown 8vo. Limp cloth. 1s.

BURTON, ISABEL (Editor). *Burton's Personal Narrative of a Pilgrimage to Al-Madinah and Meccah.* (Tylston and Edwards.) Two volumes. 8vo. Cloth. 6s. each, net.

The first two volumes of a complete Memorial Edition of Burton's works which are to appear at intervals under the editorship of Lady Burton. The pilgrimage is a celebrated one and is full of excitement and adventure. The volumes are illustrated, partly in colour, the first having as frontispiece a portrait of Lady Burton herself.

GABE, JULIUS. *Sketches of Yachting Life.* (The Yachtsman Offices.) Crown 8vo. Cloth. Pp. 105. 2s.

HYDE, SAMUEL, M.D. *Buxton: its Baths and Climate.* (John Heywood.) Crown 8vo. Cloth. Pp. 134. 2s. 6d. Second edition.

Contains an account of the waters and climate of Buxton, with chapters on baths, bathing, and massage, and descriptions of excursions round Buxton and the Peak.

MURRAY, HENRY. *Handbook for Travellers in Switzerland.* (John Murray.) Two volumes. Fcap 8vo. Cloth. 10s.

The eighteenth edition of this excellent and practically indispensable guide-book. A number of new maps, plans of towns, etc., are added, together with a mass of information bringing the matter up to date. The first volume deals with Switzerland without the Pennine Alps; the second with the Alps of Savoy and Piedmont, the Italian lakes, and part of the Dauphiné.

PAGE, J. LI. WARDEN. *The Rivers of Devon from Source to Sea.* (Seeley.) Crown 8vo. Cloth. Pp. 348. 7s. 6d. With Map.

Describes the scenery through which the rivers of Devon pass, and gives some account of the different towns on their banks. The volume, which contains over twenty illustrations, four of which are etchings, will admirably supplement the guide-book.

VICKERS, MISS L. *Old Norway and its Fjords; or, A Holiday in Norseland.* (Arkell, Ruddock, and Keyworth, Lincoln.) Crown 8vo. Cloth. Pp. 142. 2s. Illustrated.

WILSON, CLAUDE, M.D. *Mountaineering.* (George Bell and Sons.) Fcap. 8vo. Cloth. Pp. 208. 2s.

Last year Messrs. Longmans published, in the Badminton Library, a volume on Mountaineering by a number of well-known Alpine climbers; but there was certainly room for the present book, which is addressed more particularly to beginners, and which forms a volume of the All-England Series. Dr. Wilson is a member of the Alpine Club, and he treats his subject in a concise and judicious manner. Among his most important chapters are those on mountaineering in Great Britain, the dangers of the pastime, guides, snow and ice work, rock work, climbing without guides, Alpine literature, medical and surgical matters, and the necessary outfit. A few important illustrations are by Mr. Ellis Carr, of the Alpine Club; and there is also a useful glossary of mountaineering terms.

CONTENTS OF REVIEWS AND MAGAZINES.

ENGLISH AND AMERICAN.

Altruistic Review.—21, Quincy Street, Chicago. Aug. 15. 20 cents.
Peter Cooper: From an Altruistic Standpoint. Phineas Dodds.

Amateur Work.—Ward, Lock, Salisbury Square. September. 61.
Lithography for Amateurs. H. E. Grantham.
Pyrography; or, Burnt Wood Etching. Maud Maude.

American Catholic Quarterly.—Burns and Oates. July.

MR. GEO. THOS. CONGREVE'S TREATMENT.

CASE OF "HOPELESS PHTHISIS"

BROUGHT HOME TO DIE!

BUT CURED! BY THE TREATMENT OF Mr. GEO. THOS. CONGREVE.

"DEAR SIR,—I have much pleasure in writing you to say that one of my sons, whose life was despaired of in consequence of Consumption having supervened an attack of inflammation of the lungs, has been completely restored to health by your invaluable treatment. I cannot speak too highly of your medicine, for a more complete and wonderful cure, I think, has never been effected by any other medicine. My son returned home in a hopelessly dying state. By accident I heard of your remedy, and determined to try it. My wife and other members of my family were surprised and delighted to notice some change for the better, after a few days only; and in a few months, I am glad to say, my son was entirely restored to health, and is now one of the strongest and most robust of our family.

"As the publication of this case would, I think, do much good, you can make any use you like of this letter, &c. I shall write an account to my relatives living in Tasmania and Queensland, and should suggest your inserting this in the papers there.—I am, dear Sir, yours gratefully, JOHN B. HARDWICK, Selby Villas, Prettlowell Street, Southend, Essex."

In confirmation of the above, Mr. Hardwicke has sent me the certificate of his son's discharge from the Royal Navy: "Sydney Hardwicke invalided; case, *Pneumonic Phthisis*." Also a certificate as to his present state of health from a surgeon at Southend:—"I hereby certify that Sydney Hardwicke is sound in body and of good constitution."—9th August, 1882.

THE MOST SUCCESSFUL TREATMENT IN THE WORLD FOR CONSUMPTION, AND ALL CHEST DISEASES, AND RESULTS OF INFLUENZA.

Read Mr. CONGREVE'S Book "ON CONSUMPTION, ETC.," which may be had, post free for ONE SHILLING, from the Author, Coombe Lodge, Peckham, London, S.E.

THE LATE PROFESSOR JOWETT.
(From a photograph by Elliott and Fry.)

AN OFFER OF £100,000 TO MY READERS.

IN the CHRISTMAS NUMBER OF THE REVIEW OF REVIEWS for 1893 (now in the press), I have sketched in somewhat fanciful and exaggerated outline the work which I believe could be done if a daily paper such as I have suggested were established in London at the close of the nineteenth century.

I have thought about this thing for nearly a quarter of a century. At first it was more or less a visionary aspiration. But as the years rolled on and I saw more clearly what was possible, it gradually crystallised into a firm conviction that in its leading features such a work as I have suggested could be done by the conductors and subscribers of a daily paper. No editor could do it, or a tithe of it, by himself. But to an editor who was in close touch with his readers, who possessed their confidence, and could evoke their co-operation, these things are not only possible, but are well within the range of practicality.

For years I hoped that I should be able to discover somewhere in the English-speaking world some editor who had the faith in him and the energy to attempt the foundation of a paper which would be in its essence much more of an attempt to help, to serve, to instruct, to amuse, and to guide its readers than a mere quilting together of more or less well-written accounts of yesterday's happenings.

I have looked in vain.

Here and there may be found journalists of capacity who are without faith, and again there are some who have faith but who have not the capacity. But in all English-speaking lands I have hitherto failed to find any editor who believed enough in the English-speaking race and in journalism to make the attempt.

But there is no doubt as to the need for such a journal of opinion and of conduct to be established, not so much as a dividend-earning, salary-paying machine, as a *nexus* between a great body of men and women who are actuated by a common faith and a common resolve which they are prepared to demonstrate by united action. Even those who regard its creation as chimerical would readily admit that if such an organ could be established it would be extremely useful to all the causes which it advocated, and to the race as a whole. Therefore, in default of any one better qualified for the post I am willing to try my hand.

I am painfully aware of many of my own disqualifications for such a position, and my readers and friends are, no doubt, aware of others of which, fortunately for my own peace of mind, I am oblivious. I could easily define an ideal editor for such a new daily paper who would be in every way much better qualified for the task than I can pretend to be. But such a man does not exist. I do. That is the difference; and in journalism as in other things a sparrow in the hand is worth a bird of Paradise in the bush.

But I cannot honestly say that any of those disqualifications seem to me fatal to the success of the attempt. Many of them can be covered by the choice of competent assistants; and the knowledge of one's own shortcomings is often the beginning of wisdom. That, however, is not a matter for me to decide, but for you.

If I proceed to speak of my qualifications for such a position, I hope I may not be accused of doing so from inordinate vanity or irrepressible egotism. I regard a man's past training as in some respects the best guide as to his future course. From a segment of a circle you can define its circumference. Now, I frankly admit that it is quite possible I may not be the prepared man for the prepared work—to quote the quaint old phrase—but I do not think that even my most supercilious critics will deny that if such an organ ought to be started, I have many of the qualifications which its conductor should possess.

In the first case I am a journalist who believes in journalism, and I am an Englishman who believes in the English-speaking race. I have a conception which is, at least, very clear and well defined, of the way in which

journalism may be made to minister to the development of the race, and I am prepared in the maturity of my manhood to dedicate the rest of my life to the realisation of that great ideal.

To enable any one to work out this conception it is indispensable that he should be on more or less friendly and sympathetic terms of mutual understanding with the leaders of the great forces, representative of the dominant tendencies of our time. To be able to interpret each to all, a certain eclecticism of thought and a permitted liberty, not to say licence, of speech is indispensable. To conduct such a paper a man must be absolutely free to say the thing he will, free from control by a proprietor, free from pressure from advertisers, free from the restrictions of sect, and above all free from the prejudices and passions of party. Yet at the same time he must have a clearly defined standpoint of his own, from which he can approach men of all creeds and of none, without in the least fearing lest he should compromise his own faith by his sympathetic treatment of others' heresies.

When I look back to my own upbringing, and remember how I was started in life as an errand boy in Newcastle, when I was only fourteen years of age, with the convictions natural to the son of a Radical Congregational minister on Tyneside—nay, when I recall even the passionate zeal of my partisanship when eight years later I began to edit a daily paper—I marvel much that I should have arrived at my present standpoint. I feel that I have indeed been led by a way I knew not of, and that as the result of my pilgrimage I have been better prepared to act as a common centre of communication between men of opposing churches and parties and nations, than most journalists of my time.

I am the only English journalist who has been on terms of personal and more or less confidential communication with the Cardinal Secretary of State at the Vatican, with the Procurator-General of the Holy Synod, with the Archbishop of Canterbury, and with the leading Nonconformists. I gave the right hand of fellowship to Annie Besant over the grave of a Freethinker who had been killed in Trafalgar Square, and yet I have never ceased to rejoice in the strength and the consolation of the simple faith which I learned at my mother's knee. With many men growing tolerance is the result of decaying faith. With me it is the reverse. I am more sympathetic, not because I believe less, but because I believe more. Life has only deepened my faith in the central principle of the providential government of the world and of the individual.

After Religion no factor is so potent as Race. And here I have won an uncontested right to speak. I am the only English journalist who edits an organ of opinion whose area of circulation is co-extensive with the English-speaking race. There are American magazines containing interesting stories and admirable illustrations which have a circulation as wide, but they are not organs of opinion. The *Strand* has a greater circulation still, but it is of the same class, and it is practically confined to Great Britain. I am in the unique position of conducting a monthly organ of opinion, both religious, social, political, and literary, which has 200,000 subscribers, almost equally divided between the English-speaking world at home and the English-speaking world over sea. And from first to last the REVIEW has never ceased to proclaim its faith in the unity of the race and to promote by every means in its power the healing of the great disruption of last century.

After Religion and Race, the most potent factor in the world is Sex, if indeed it does not come first. The advent of Woman to the full status of a human being, entitled to all the rights and privileges of a human being, is the hope of the future, as the dawn of that advent has been the most notable factor of recent social progress. In all that relates to the Woman question, whether it be her protection from the cruellest wrong in her early youth, or her deliverance from the unjust restrictions and disabilities which limit her usefulness and retard her development in maturer years, I do not think that any woman will be disposed to question that I have ever fought in the van.

The faculty of conciliating opposites, of combining the friendship and confidence of the most thorough-going opponents, has of course its disadvantages. No one is ever absolutely sure of the line which I will take on any given question of details or of persons at any given time; and this leads naturally to a certain lack of that hearty confidence which party men give to party leaders. But looking over my journalistic career, from the time when I entered the editorial office of the *Northern Echo* down to this very day, I am surprised at nothing so much as the identity and consistency of the convictions that have been expressed throughout. I have broadened here and there. I have developed naturally; but in all fundamentals I have preserved a consistency which, whether admirable or otherwise, is surprising even to myself.

To make a long story short, I feel that if the paper which I have dreamed of so long, and which I have described at length in the Christmas Number now going through the press, is really wanted by any considerable number of my fellow countrymen, I shall not be justified in refusing to start it. At the same time, unless I have a clear and unmistakable call, I do not wish to risk my health in an enterprise which it might be presumption for me to undertake.

I do not wish to bring out a paper unless it is wanted, and unless I can induce those who want it to co-operate with me in making it a success from the very outset. But while inviting co-operation, it must be on terms which do not subject me to any control. If I ever edit a Daily Paper again I must be as free as air to say the thing I will without having to consult any other authority but my own conscience.

How can these apparently contradictory requirements be allowed? If any capitalists supply me with funds, the men who pay the piper will naturally wish to call the tune. If I find the capital myself I lose the advantage which comes from enlisting the pecuniary interest of a large number of shareholders. What then can be done?

It has occurred to me that the solution of this problem might be found by a very simple expedient. And that is, I might raise my capital and secure my co-operators by giving it away.

This sounds paradoxical, but it is sober sense. I have worked it out after consultation with the ablest financiers, lawyers, journalists and accountants in London.

As a beginning I form and register, merely in order to facilitate the issue of debentures, a Company to be called "The Daily Paper Company, Limited"; the Articles of Association will set forth that it is formed for the purpose of printing and publishing a Daily Paper which I am to be free to edit and control as I please.

Having brought this Company into existence, I offer to the readers of THE REVIEW OF REVIEWS the opportunity of co-operating with me in producing the new paper on the following terms:—

With this copy of the REVIEW is enclosed a form of order for the *Daily Paper* for the first twelve months after it is started.

(1) If 100,000 of these forms are sent to the National Provincial Bank of England, Limited, at the Head Office, or any of its branches, accompanied by 26s. for one year's subscription, I will undertake to bring out the paper, and each subscriber will receive the *Daily Paper* every day for one year through his Newsagent, if he is in a town receiving daily parcels of papers from London. Where they only can be delivered by post, 13s. must be added for postage.

(2) To the first 100,000 subscribers I will give by way of bonus a Debenture Bond for £1 in The Daily Paper Company, Limited, redeemable at par at my option. These Debenture Bonds will have coupons attached entitling the holder to receive interest annually at the rate of five per cent., so long as the circulation of the paper is between 100,000 and 150,000—seven and a-half per cent. between 150,000 and 200,000; and ten per cent. when the circulation exceeds 200,000.

By this means any subscriber of twenty-six shillings for the first year will receive, not only three hundred and twelve penny papers, but a Debenture Bond of the value of £1, bearing interest from five to ten per cent., for which he will receive £1 when I redeem it.

The way in which this would operate may best be seen by supposing that if any Helpers or sympathisers in any one town, or the members of any political or social or religious organisation, were to subscribe for 1000 copies of the paper, and place the 1000 Debenture Bonds to the credit of the Civic Centre, or to their own religious, political, or social organisation, the result would be that, by the simple process of paying twenty-six shillings in advance, instead of in 312 daily instalments of one penny, they would endow their society with a capital sum of £1000, yielding from £50 to £100 per annum interest, according to the prosperity of the paper. Suppose, for instance, that each of our 100,000 subscribers were to fill in the order form and make his bond payable to the Liberator Relief Fund, that fund would receive from me 100,000 debenture bonds, bearing from 5 to 10 per cent. interest. The working of this arrangement is best illustrated by the supposition that ten or a hundred subscribers club their bonds. Five per cent. on a twenty-shilling bond is only a shilling per annum; but 5 per cent. on a hundred or a thousand bonds amounts to a very respectable sum.

My object in thus giving away the capital on which the paper will be started is not philanthropic or generous. It is good business. I want to establish a tie between my readers and the paper which I propose to publish, so I make them debenture-holders, and undertake to pay them a minimum of five thousand pounds per annum as long as the circulation is 100,000 per day. I want to interest them pecuniarily in the success of the paper to make it a co-operative enterprise, so I promise to raise the interest to £10,000 a year if the circulation rises to 200,000.

I think the paper could be produced by July 1st. If 100,000 persons subscribe for it, I will undertake to produce it, if possible, by that time. If fewer than 100,000 subscribe, I will return the money without deduction. I make the first offer to the readers of the REVIEW. They know my ideals, and need no explanation as to my aims and objects. I intend, so far as I can, to make the *Daily Paper* a faithful exponent of what I conceive to be the truth. It will be in no sense a party paper, as the REVIEW is in no sense a party REVIEW. Therefore, all readers of the REVIEW have the offer absolute till the 1st November. Such mortgage bonds as have been applied for by my readers will be allotted definitely, and the balance only will be left open for allotment to the readers of the Christmas Number.

As will be seen by the annexed correspondence, the subscriptions will in the meantime be held by the National Provincial Bank of England, Limited, to the order of Messrs. Schultz and Comins, Chartered Accountants, 46, Cannon Street, London, E.C., who will act as trustees to see the money is returned if the subscription is inadequate, and if otherwise, that the debentures are issued before handing the money in to The Daily Paper Company, Limited.

It is seldom that a man who reaches the prime of life when, if ever, he is to realise the aspirations of his youth, contemplates the result of an appeal which is to decide his future with such supreme content as that with which I launch this proposal. I shall be glad, very glad, if my fellow-countrymen and countrywomen desire me to do this thing, and their support will encourage me to attempt an enterprise from which, now I look at it closely, I might otherwise have recoiled.

But I shall also be glad, very glad, if by the absence of any response to this appeal I have a definite and decisive intimation that I am not wanted for this work. The one thing that is intolerable is indecision and suspense, so I boldly put my fortune to the touch, to win or lose it all, watching with a pleasant curiosity the issue of the test, and feeling sure that the good Caliph Ali was wise when he wrote those golden words, "Thy Place in life is seeking after thee, therefore be thou at rest from seeking after it."

W. T. STEAD.

NOTICE TO INTENDING SUBSCRIBERS.

WITH each copy of this number of **THE REVIEW OF REVIEWS** is issued a form of application which entitles the holder to become a Debenture holder to the extent of One Pound Sterling in "The Daily Paper Company, Limited," on the conditions therein stated. No allotment of the Debenture Bonds will be made to the general public until all the regular subscribers to the REVIEW who post their applications by 1st November, 1893, have been supplied.

No allotment will be made unless 100,000 subscriptions are received; and the list will be closed on December 31st. All cheques to be made payable to the National Provincial Bank of England, Limited, at any of its branches.

The following correspondence explains itself:—

Messrs. Schultz and Comins, Chartered Accountants,
46, Cannon Street, E.C.

REVIEW OF REVIEWS Office,
October 2nd, 1893.

Gentlemen,—I request you to accept the position of Trustees on behalf of The Daily Paper Company, Limited, in regard to the subscriptions, to be paid into the National Provincial Bank of England, under the scheme described in the October Number of THE REVIEW OF REVIEWS, which the Bank has undertaken to hold at your order.

If 100,000 subscriptions have not been paid in on or before December 31st, I desire you to direct the return in full to the subscribers of all subscriptions paid into the Bank on account of The Daily Paper Company, Limited.

If 100,000 subscriptions have been paid in, I request you first to ascertain that Debenture Bonds to the amount of £100,000 have been issued to the subscribers, in accordance with the promises made by me, and then to hand over to The Daily Paper Company, Limited, the moneys subscribed after deducting (£5000) five thousand pounds, which the Bank will retain, to your order, as security for the payment of the first year's dividend.—I am, yours truly,
(Signed) W. T. STEAD.

W. T. Stead, Esq.,
Mowbray House, E.C.

46, Cannon Street, London, E.C.
October 2nd, 1893.

Dear Sir,—We have received your letter of this day's date, and hereby undertake to act as Trustees for The Daily Paper Company, Limited, in accordance with the conditions set forth therein.—We are, dear Sir, yours faithfully,
(Signed) SCHULTZ AND COMINS, Chartered Accountants.

THE PROGRESS OF THE WORLD.

LONDON, October 1st.

The progress of the world depends upon the progress of ideas, and of the ideas that are most essential to the progressive

Anglo-America.

development of the human race none is more important than that of the unity between the English-speaking peoples. That unity at present exists in literature and language, and the only weak link in the circle is the political disruption that dates from the revolt of the American colonies. To breach the yawning chasm thus created is the great task that lies before the patriots of both countries. The first practical step in this direction is the establishment of a permanent tribunal, composed by delegates from the Supreme Court of Washington and the Court of the Privy Council, which would be empowered to adjudicate on all disputes that arise between the citizens of the Empire and the citizens of the Republic. When the Behring Sea Arbitration Board was constituted, I ventured to object to the intrusion of foreigners into a domestic dispute. It seemed contrary to sound principle to allow French, Italians, and Swedes to settle the right and wrong of a

question that was distinctly a domestic one between England and the United States. I note, therefore, with much satisfaction that Mr. Harland, the representative of the Supreme Court of Washington on the Arbitration tribunal, has just expressed himself in the same sense. Mr. Harland, after leaving Paris, came to London, and in conversation with the Rev. Hugh Price Hughes, stated that, in his opinion, the next question referred to arbitration between the two countries should be tried by a tribunal constituted by delegates of the Supreme Court and the Judicial Committee of the Privy Council without the intervention of any strangers. This is as it should be, and such an expression of opinion, coming from so distinguished a judge and arbitrator, is a welcome indication of the progress that is being made towards the establishment of the tribunal which will be the first visible and outward sign of the reunion of the English-speaking race. All progress in this or, indeed, in any direction, to be stable must be slow,

and the foundations must be laid broad and deep in the matured convictions of the nations if anything lasting is to be achieved.

The Positivist A very remarkable illustration of the Plungers of consequence of attempting to progress Brazil.

by plunging is afforded by the miserable news which has been coming to hand nearly every day for the last month from Brazil. That great Empire, which during the reign of the late Emperor rested in almost profound peace, during which slavery was abolished without the firing of a shot, has for the last two or three years been made the scene of a crucial experiment.

A little knot of Positivist professors, upon whose minds the philosophy of Auguste Comte had dawned as a new revelation, were unlucky enough to be able to upset the old Imperial dynasty and found a republic, in which the whole political system of Auguste Comte was applied *en bloc*, and in detail, to Brazil. The Positivist prophets, being mounted on horseback, rapidly rode to the abyss. Brazil is to-day torn by civil war; her navy is bombarding her capital, and no one can tell how much of the stately fabric of the Brazilian Empire will be left intact before

MARSHAL FLORIANO PEIXOTO.

the nation has readjusted its political institutions to the Brazilian average of civilisation. The story of the reign of the Positivists in Brazil is one which should be told at length as a great object lesson in the danger of political plunging. Imagine Mr. Frederic Harrison by a sudden fluke installed as virtual dictator at Westminster, and we can form some kind of idea of the difficulties which confronted the new *régime* in Brazil. The Dorset agricultural labourer is much nearer to the intellectual level of Mr. Frederic Harrison than the illiterate newly-enfranchised semi-slave population of Brazil is to the level of the apostles of the Positivist philosophy. The immediate cause of the trouble is somewhat obscure.

The Bombardment of Rio. President Peixoto having vetoed the bill, rendering it impossible for the Vice-President to succeed to the Presidency, the Opposition brought forward a motion for his impeachment, which was rejected. Thereupon

Admiral de Mello, who was in command of the fleet, revolted against the Government. In the manifesto which he recently issued, the Admiral charges the President with endeavouring to place Brazil under the rule of absolute tyranny. Four members of the Brazilian Congress, who were on board the Admiral's flagship, declare that the Peixoto Cabinet has been using public funds, destroying the autonomy of the States, and fomenting national war, in order to serve their own personal ends; therefore, these four are compelled, as representatives of the national will, to make a solemn fight for freedom. The manifesto of the four recalls

to be able to appreciate the advantages of being able to lie by telegram. The result, however, causes considerable confusion to the outside world, which every day reads announcements, first, that the insurrection is on its last legs, and secondly, that the Government is just on the point of collapsing altogether. At present the odds seem to be heavy on the side of the fleet, but prophesying is dangerous at all times, especially in South America.

Troubled Argentina.

So far as England is concerned the renewed disturbances in the Argentine Republic are even more serious than the bombardment of Rio. The insurrection in the

THE ENTRANCE TO RIO DE JANEIRO.

reminiscences of the three tailors of Tooley Street. The importance, however, of the movement does not depend upon the dauntless four, but upon the Admiral and his war-ships. They bombarded Niteroy, the capital of the State of Rio, and then shelled Rio itself. There seems to be no doubt that the difficulties which culminated in the revolt were largely due to economic causes. Last year the coffee crop was a bumper; this year it is about one-fifth of what it was twelve months ago. If the insurrection in Rio Grande continues, and if the bombardment of the capital lasts much longer, there is no knowing what may happen. Both parties seem

Argentine is due to the determined attempt made by the Radical party in the provinces to obtain possession of the provincial governors. It is headed by Dr. Alem, a Radical apostle who has for some time been carrying on an agitation in favour of allowing each province to elect its own governor, and manage its own affairs in its own way. The National Government decreed the disarmament of the Provincial Governments; but as nothing was done to carry this out, the Radicals roused the populace to take the law into their own hands. The revolutionists seem to be having things pretty much to themselves in the interior, and it is

reported that the fleet is not unfavourably disposed to the revolution. At present the heads of the Argentine Government do not appear to have much hold upon the confidence of the country, and as an attempt to reinforce their garrisons in the interior was frustrated by the simple but effective process of tearing up the rails and pulling down the railway bridges, there is not much likelihood of a speedy suppression of the revolt. All this can hardly fail to react disastrously upon the settlement of Argentine finance, and anything that affects Argentine finance postpones the chance of settling down in the City. Our present financial straits date from the time when Argentinas smashed Baring, and until the Baring liquidation is at an end every upset in the Argentine Republic is apt to react badly in London.

The Coal War. September this year must have been under the influence of a somewhat turbulent star, for not only have we insurrections in Argentine, and the bombardment of the capital of Brazil, but we have had actual bloodshed at home in connection with the dispute about the miners' wages. The refusal of the miners to permit impartial arbitrators to adjudicate on the question as to whether or not it was possible for employers to pay reduced wages in face of a fall in the price of coal, continues to paralyse the whole of the coal industry of the country. The dispute has now lasted for nearly two months, and neither side is willing to admit that it is beaten. The money loss can only be reckoned by millions; and the misery occasioned to the rank and file, not only of the colliers, but of the workmen in related industries, which are stopped for want of coal, has been very intense. For the most part it has been borne silently, but at Featherstone, in the West Riding of Yorkshire, much to the astonishment of everybody, a mob of miners attacked the colliery and set fire to the property of the coal-owner. They smashed the building and the machinery and accomplished as much destruction as they could. At last patience gave way. While they were engaged in destroying the colliery buildings, a small force of soldiers was ordered up by the magistrate; and the rioters refusing to disperse, the troops fired on them with ball cartridge, killing three and wounding several others. Thereupon the crowd dispersed. Coroners' inquests were held, with a Debate following in the House of Commons. It was abundantly evident that under the circumstances the military had no option but to fire, and Mr. Asquith, while assenting to an inquiry

into the conduct of the authorities, gained much approval by the frank and courageous manner in which he defended the right to shoot from his place in the House of Commons.

Nationalising the Coal Mines. The miserable spectacle presented by the suicidal dispute in the coal trade has quickened the attention which is being paid to the discovery of some mode of substituting co-operation for competition. The most remarkable suggestion of this kind is that which has been made by Sir George Elliot, at one time Member for North Durham, and well known in the North country as the man who had made his way from being a pit laddie to a position of wealth and influence. Sir George Elliot has put forward a scheme for the

SIR GEORGE ELLIOT, BART.
(From a photograph by Anzinger, "Bad Emr.")

formation of a gigantic coal trust. He calculates that all the collieries in Great Britain could be converted into one concern with a capital of £120,000,000. If this were done, cut-throat competition between rival coal-fields and individual coal-owners would be averted; coal would be worked more economically, and a great deal could be done towards the improvement of the means of production, as well as to secure for miners more regular employment. It is unnecessary to enter here upon the method by which Sir George Elliot thinks the great National Coal Company could be managed so as to combine on a semi-co-operative basis the interests of employers and employed, but suffice it to say that he thinks the trust would secure the present owners a dividend of five per cent., and a possible

dividend of fifteen per cent. The price once fixed should not be raised, excepting with the consent of the Government of the day, and when it was raised, both the stock-holder, the workman, and the consumer should share in the advance. The scheme is admittedly a tentative one, but it is put forward by a man of great experience who has risen from the ranks, and who does not approach the subject from the point of view of the revolutionary theorist. His proposal may be all wrong in detail, but no error of that kind can diminish the importance of the fact that we have this month the testimony of a prince of practical capitalists that it would be economically advantageous to nationalise the coal-mines of the kingdom.

Politically, the chief event at home has been the summary rejection of the Home Rule Bill by the House of Lords by an almost unprecedented majority of 419 to 41. The Home Rule Bill was read a third time in the House of Commons by a majority of 34; 644 members either voted or paired, 349 supporting the Bill, 315 opposing it. Mr. Wallace and Mr. Rathbone refused to vote; Sir Edward Watkin, Baron Henry de Worms, and Mr. J. Wilson, of Durham, were absent unpaired. The majority was entirely due to the Irish vote. Excluding the Irish, there was a majority of 23 against the Bill. The majority in England and Wales against the Bill was 48, while in England alone the hostile majority was 70. With such figures before them, the House of Lords felt encouraged, for almost the first time in its existence, to express its real opinion with emphasis, and it did so, and no mistake. The House of Lords is, on the whole, a somewhat timid body; but it is always trying it on. If the Peers voted according to their own principles or prejudices they would have thrown out almost every measure that has brought about the pacific transformation of the English Constitution. When the reform concerns England or the interests of English people they usually only try it on once; but when the matter only concerns Ireland they try it on not once but many times, usually with the most disastrous results to the interests of the Irish people. When, therefore, they have behind them a decided majority of English Members they are as pert as cock sparrows, and vote with the utmost assurance as their conscience dictates.

This last month, for the first time in the life of most of the Peers, they were able to satisfy their consciences and gratify their prejudices, and pose as the champions of the English

masses at one and the same time. Under those circumstances it is hardly surprising that they voted ten to one against the Home Rule Bill. Some years ago I published a little book called "Fifty Years of the House of Lords," that went through several editions, and which set forth plainly and simply a record of the Peers since the Reform Bill. This reference to the facts of history is much the most damaging weapon that can be used against the House of Lords. It is difficult for any impartial person to read the first forty-four pages of that little book without feeling that this heavy vote of the House of Lords against Home Rule ought to tell, and in all probability will tell, as a strong argument in favour of Home Rule. The Lords have been so uniformly wrong in all their dealings with Ireland; they have so constantly retarded reform until it lost its virtue and its efficacy, that there is the strongest reason for believing that on this occasion they are equally mistaken. Mr. Roebuck was not by any means a modern Radical; but in 1837 he told the Liberal Ministry bluntly that the House of Lords was an insuperable obstacle to the good government of Ireland. The passage in which he addressed the Ministers of that time on the subject of their duty in relation to Ireland is as follows: "You should have boldly told the people of both countries that justice could not be gained by either while an irresponsible body of hereditary legislators could at will dispose of the fortunes and the happiness of the people. We have laboured in order to relieve the miseries of Ireland, and if possible to heal the wounds inflicted by many centuries of misrule. We have not advanced one single step. Every year sees our labours rendered abortive by the headstrong proceedings of the House of Lords. If we wish for peace with Ireland, we must change this faulty system."

The four days' debate which preceded the administration of the *coup de grâce* to the Home Rule Bill in the Lords does not call for any special note. Lord Rosebery, having an impossible task to perform, discharged his duty with his accustomed agility, and Lord Salisbury did his part as was expected of him. The most significant thing about the division, apart from the overwhelming strength of the majority, was the fact that there was not a single bishop in the minority. Three or four prelates stayed away, but all the rest went into the Lobby with the majority. Of course bishops, like other people, are bound to vote according to their consciences, but the custodians of

The Peers
and the Irish.

The Bishops'
Vote.

the Church of England have ground for grave searchings of heart as to how it is that on a party issue all the right reverend lord bishops should be found on one side. Such astonishing unanimity is an alarming illustration of the extent to which the Church has got out of touch with the people with whom it is supposed to be in the closest contact. If the bishops had been divided in the same proportions as their English flocks, leaving Wales out of the question, at least one-third of their number ought to have voted with the Government. Both the Unionists and the State Churchmen will long have reason to regret the unanimity of the episcopal vote.

The practical **Too Unanimous.** unanimity of the Peers in opposition to the Home Rule Bill is an unhealthy sign of the division between the people and the aristocracy. Whatever may be said as to the demerits of the Home Rule Bill, it is ridiculous to assert that the arguments which convinced nearly one-half of the electors of Great Britain would not have been powerful enough to convince an equal proportion of the Peers if they were not swayed by interests or prejudices which separate them from the rest of their fellow-countrymen. If that country is in the healthiest condition in which there is practical identity of interests among all classes, then we are indeed in a bad way, and the sharp antagonism which is thus revealed—not for the first time—between our hereditary legislators and the representatives of the people bodes no good for the Peers. At the same time, it is folly to ignore that, for once in a way, the House of Lords has had a quasi-democratic sanction for the step which it has taken. A body which intermittently asserts its right to set itself in opposition to the majority of each of the three kingdoms, England not excluded, can hardly be blamed when almost for the first time it finds its action supported by a majority of the

electors of England. The Peers in the past have always yielded to two things, and to two things only. Their veto on all measures of Liberal reform has been set on one side either to a more or less frankly-applied intimidation resting upon popular agitation in England, or to what they regard as the treason of the leaders of the Conservative Party. As these are the only arguments which have the slightest weight with the majority of the Upper House, it was certain that they could do nothing except what they have done. But there is not the faintest chance of an intimidatory campaign

being set on foot in England, and agitation outside England has no influence on the Lords. English electors are not going to hold indignation meetings because the Lords have practically given effect to the wishes of the voting majority of the English representatives. The other argument will not be applied until we have a Conservative Ministry in office; that, however, is probably nearer than most people expect. When it does come we shall probably have a system of Local Government in Ireland which in its practical working will be indistinguishable from Home Rule.

Mr. Gladstone, whose energy at Edinburgh. and perennial

From *Judy*.]

DAMP!

[September 27, 1893.]

youth excite the admiration of his friends and the despair of his enemies, after refreshing himself for a few weeks at Blackcraig, has taken the platform at Edinburgh for the purpose of hurling defiance at the Lords. His speech, although emphatic enough in its general tone, showed clearly enough that Mr. Gladstone has no intention of setting fire to the heather in the shape of a popular agitation against the House of Lords. He knows too well that the heather is wet. Mr. Gladstone disclaimed all appeals to violence or even to vehemence, and declared that what was wanted was "determination, calm, solid, quiet, but fixed determination." But the Peers will snap their fingers at determination—until they find

expression in another dissolution. A calm, solid, but fixed determination that shrinks from a dissolution which, if it went our way, would settle the question once for all, is a determination which will only determine the Lords to persevere in their present course. A dissolution is the last thing in the world of which the Government is thinking.

The autumn session is to be devoted to the Employers' Liability Bill and the Parish Councils Bill, the latter being no longer confined to England, but extended to Wales and Scotland. Mr. Gladstone's speech was eagerly scanned for indications of the intentions of the Government with regard to next year, but the oracle was judiciously vague. The feeling is growing that there will be no reintroduction of the Home Rule Bill next year, and that the whole of the session will be devoted to an attempt to carry out the Newcastle programme. The special correspondent of *United Ireland* writes in favour of this policy. "Personally," he says, "I do not see that the formal reintroduction of the Bill next year is a matter of vital importance for Ireland. The issue of Home Rule is totally eclipsed, and Home Rule is naturally postponed until after the next General Election." Of course, if the Irish agree to this, no one on this side of the water will raise any objection. It is a question which the Irish will have to decide; and, judging from the remarks of this correspondent in *United Ireland*, it would seem as if even the most advanced section of the Nationalists were disposed to acquiesce in postponing the question until after the inevitable dissolution.

If the Home Rule block is removed, it will be a mistake to think that the Irish question will be out of the way. Legislation for the evicted tenants will become one of the first orders of the day. A Reinstatement Bill, however, will be somewhat difficult to get through the House of Lords, and the financial sacrifices which it may possibly entail will not make it very popular in the House of Commons. Then behind the question of the Evicted Tenants is the question of Amnesty. That question, however, although good enough for popular agitation, is not of serious Parliamentary importance. It is understood that the Government will introduce a Bill for the Disestablishment of the Welsh Church, and follow that up by legislation for London. If any time remains they will attempt to do something to deal with the Liquor Traffic and with the Labour Laws. All these calculations may be upset by death at home or war abroad.

The Mr. Gladstone, speaking at Edinburgh, Protection of deplored the legislative famine which has Commons. been characteristic of this session. The Home Rule Bill, like Pharaoh's lean kine, has devoured all the other Bills, only to be slaughtered itself. Many measures which ought to have passed into law have been sacrificed, and very few have been allowed to slip through the double barrier of Home Rule and obstruction. One of these was a little Bill, the need of which was recognised by a Parliamentary Committee seventeen years since. It is a Bill which practically repeals the Statute of Merton, whereby lords of the manor or landed proprietors were permitted to enclose common land. The statute passed this year limits the application of the Statute of Merton to cases in which the consent of the Board of Agriculture has been obtained, and this consent it is expressly stated is not to be given unless the Board is convinced that the proposed enclosure is for the benefit of the public. After this we hope that the legalised theft of our common lands will be checked.

The House of Commons has broken down this Session, not merely as a legislative, but also as a debating, concern. If there were half a dozen Peers who were alert and had the true metal in them, they might have scored heavily for the Upper Chamber. A series of animated debates upon questions which the House of Commons wished to debate, but could not, would have done the House of Lords good. Unfortunately for them, the half-dozen Peers were not forthcoming, and if a public question cannot be discussed in the House of Commons, it will not be discussed elsewhere. A very remarkable instance of the way in which the rules of the House of Commons can be used to gag debate, even when time exists for such discussion, was afforded in the last months of last session by Sir Richard Temple.

Lord Roberts My readers will remember that early in the year I declared in these pages that the House of Commons. Lord Roberts or the military authorities in India were responsible for the systematic evasion of the orders issued by the Home Government for the discontinuance of the examination of women of ill-fame in the supposed interests of the British garrison in India. My statements were scouted and ridiculed. A departmental committee was appointed which took evidence on the subject and confirmed the absolute truth of the statements which had been denied. Mr. Stansfeld, a leading member of that committee, was anxious to call attention in the

House to the scandalous breach of good faith of which these Indian officials have been guilty. Apart from the moral questions involved, the subject was supremely important owing to the political issue which it raised, namely, whether Parliament was or was not to exercise any effective control over the administration of India. The will of Parliament had been openly defied, and the Commander-in-Chief had publically apologised for having denied the existence of a state of things of which he ought to have been cognisant. The facts were established beyond any dispute, and the report of the Departmental Committee was before the House; but notwithstanding the importance of the question and the undisputed facts, Parliament was gagged, and not one word could be said upon the subject even when the Indian Budget was being discussed.

**Burking
Debate.**

The way in which this was effected was very simple. Sir Richard Temple gave notice of his intention to move a resolution on the subject. As long as that notice was on the notice-paper no other member could move a resolution or even make a speech on the one occasion on which the administration of India is supposed to come fully before the House of Commons, namely, on the night of the Indian Budget. Repeated efforts were made to get round this obstacle, but Sir Richard Temple remained obdurate, and the House was gagged. It is obvious that if this can be done in one case it can be done in others, and any department of the Government which wishes to avoid a debate upon any of its many shortcomings only needs to put up a private member to give notice that he will move a resolution on the subject, which, when the time comes, he can withdraw without apology or excuse. By merely putting a notice on the notice-paper the mouths of all those who may wish to expose a scandal or denounce an abuse are effectually closed.

**The Crisis
in
Mashonaland.**

Before Parliament rose there were several questions asked, and numerous Ministerial explanations given, concerning the threatened outbreak of war between the British South African Company and Lobengula. Ministers are evidently very anxious lest the eager spirits at the front should force their hands, and lest Mr. Rhodes should do with Lobengula as Sir Bartle Frere did with Cetewayo. Mr. Buxton stated that the Government insisted that, under present circumstances, our consent must first be obtained before an aggressive movement can be made against Lobengula. Of course, he added, if Lobengula

attacked, the Company would be justified in making any offensive operations which it deemed necessary. The Ministerial reply shows clearly the absurdity of thinking that, when a crisis becomes acute, Downing Street can exercise any effective control over the troops at the front. The art of tempting your adversary to begin operations is so well understood that Mr. Rhodes has practically a free hand. If he wants to smash Lobengula and thinks that he has got the means of doing so, he will be able to do it without in the least departing from the line of action laid down for him by Lord Ripon.

**French
Restlessness.**

Matabeleland is the great danger point in Africa; but a nasty little quarrel brewing between the French and the English on the Niger. The facts of the case fortunately seem to be so clearly in our favour that it is difficult to think that the French Foreign Office will espouse the cause of the invading intruder. France is by no means in a quiescent mood. She is pressing her demands upon Siam with a ruthless severity. According to the telegrams from the Far East, the Siamese have accepted all the demands contained in the French Ultimatum, only to find that new and further claims are being put forward, which will practically reduce their kingdom to the position of a French province. The extension of French influence in this region need not seriously alarm us. The power which has the superior navy can treat its rival's possessions as so many hostages. We could not hold India if the French fleet dominated the Indian Ocean, and the tricolour would only fly in Asia on sufferance if France were to provoke a quarrel with a superior naval power.

**The Russian
Fleet at
Toulon.**

The French seem to be simmering up to boiling-point, and it will be well if the visit of the Russian fleet to Toulon does not cause the national pot to boil over. The Tsar, of course, could not do less than return the visit of the French fleet to Cronstadt, and the French—who whether in cookery or in politics know how to make the best out of the least materials—have organised a series of fêtes and receptions which could hardly be excelled, if they had been concluding a fighting alliance with the Russian Emperor. As a matter of fact, they have nothing whatever in the shape of a definite treaty, and the only result so far of the *rapprochement* in the eyes of the Tsar is the additional influence which it gives him over the politicians of Paris, whom he thoroughly distrusts, and with good cause. The Tsar knows perfectly well what he

means in this business. But there are ingenious and unscrupulous gentlemen in France who have their own interests to serve in misrepresenting his actions, and as they have command of the press, while the Tsar is silent and inarticulate, there is considerable danger that the French may come to consider that the Tsar would

back them if they declared war with Germany. It is to be hoped that before trying the experiment they will take the trouble to ascertain the views of Alexander the Third. If they should do so, I do not envy their ambassador his task.

The French elections resulted in the defeat of M. Clémenceau, and confirmed the majority of the moderate Republicans. With M. Clémenceau disappears the one conspicuous and interesting figure in French politics. The new Chamber, bereft of M. Clémenceau and the Count de Mun, to say nothing of less conspicuous notables, will be even less interesting than its predecessor. The Socialist and Labour party will, no doubt, make a struggle to show what they can do. They have already attempted to utilise their electoral success in industrial disputes, but have not succeeded very well. Some notes of a conversation with the Pope are published, which confirm the impression of his statesman-like foresight. Last spring, Leo XIII. is stated to have said to the late Archbishop of Rennes: "You French do not know how to wait. The Pope looks far ahead, and has to prepare for

From *Il Papagallo*. [Sept. 24, 1893.
RUSSIA IN THE MEDITERRANEAN.

If this giant could establish himself in the South, he would kick the dog and crush the tail of the cat, with his right hand humble the sailor, and with his left suffocate the commerce of the friend who would have called upon him for his assistance.

the future. Probably you will not succeed at the coming elections nor at the next, nor possibly at the next after those, but later on." M. Goblet, who takes his place as the leader of the Opposition, has issued his programme, which is based upon the possibility of a working alliance between the Radicals and the Socialists.

There was but little to record in Germany last month. The tariff war continues with Russia. The German Emperor has visited his Austrian ally, and has interchanged a civil telegram with Prince Bismarck. The old statesman being ill, the young Emperor offered him one of his castles as a residence. Bismarck thanked his sovereign, but declined the offer, saying that he would roover best at home. The Emperor has been making a tour of inspection through the border provinces on which the brunt of the next war will fall. The French squirmed a little at the Imperial visit to the lost provinces, but in the provinces them-

[September 3, 1893.

THE GERMAN MANŒUVRES IN ALSACE LORRAINE.

"Why do they return to insult me in my sorrow?"
"Do you forget that the criminal cannot refrain from visiting the scene of his crime?"

selves the Emperor seems to have been well received. In the course of his tour the Kaiser was really quite reasonable in his speeches, all of which have been forgotten by this time, excepting one in which he spoke of Germany as standing like Heimdal, the warder of the gods, as sentinel in the Temple of Universal Peace.

cholera poison. The mortality among the pilgrims this year has been enormous, and sanitarians in Western Europe are discussing whether or not it would not be justifiable for civilisation to compel the Sultan, even at the cannon's mouth, to carry out radical sanitary reforms in Mecca. It is of course just as

M. ZOLA.

(From a photograph by A. Labart, Paris.)

The Cholera as a Casus Belli. The cholera has been furnishing occasional corpses to the undertaker and constant paragraphs to the papers, but there has been no great outbreak in Western Europe. There seems to be a pretty general opinion that the cholera was generated at Mecca, where the water of the sacred well Zem-Zem is declared to be full of

possible to force sanitation by ultimatum as to forbid religious persecution, or to insist upon the concession of autonomy by the same rough-and-ready expedient; still it would be novel to see the combined fleets of Europe threatening to pitch the Sultan into the Bosphorus if he did not set the scavengers to work in the Holy City. A main drainage scheme for Mecca

is an object which, to say the least, is as much worth while going to war about as most of the objects for which sovereigns and nations fight. But the hygienists have not yet the ironclads of the world at their disposal.

Parliament has risen, and we have had Congresses—the usual saturnalia of conferences and Scientific and Otherwise. congresses. The Trades Union Congress led off by meeting at Belfast and passing an enormous number of ill-digested and half-thought-out resolutions,—among other trifles a demand for the nationalisation of pretty nearly everything. Then came the British Association, which met this year at Nottingham. After listening to a rather

DR. BURDON-SANDERSON.

long and dreary discourse by Dr. Burdon-Sanderson, it settled down to a diet of papers containing very little of sensational interest. The Associated Chambers of Commerce met at Plymouth, where Sir Alfred Rollit proclaimed, although with many qualifications, that the tide was turning, and that we were on the eve of a slight revival of trade, if, of course, it were not checked by the labour disputes. The Church Congress meets this year at Birmingham, but the sensation of the autumnal gatherings has been the reception of M. Zola by the Institute of Journalists, which held its annual meeting in London.

A short time ago Mr. Vizetelly was clapped into gaol for publishing an unpurgated edition of one of Zola's works. Fortunately his sentence expired in time to allow the unlucky publisher to occupy a conspicuous place among those gathered to do honour to the French novelist. M. Zola, who was accompanied by his wife, spent nearly a week in London enjoying some things and being extremely bored by others. His address on "Anonymity in Journalism" lay somewhat outside his line of usual studies. M. Zola supported anonymity in the case of political articles, but thought that critical, literary, and social sketches ought to be signed by their authors. He gave a very vivid description of

the condition of the French press, and declared that nothing but anonymity would restore honesty and disinterestedness to their political newspapers. At the same time, he declared that to take away a writer's name results in diminishing his power.

It has been decided definitely to close the World's Fair on the 31st of October. The Chicago Congresses. Probably the very flimsy materials of which the edifices are constructed would not stand the storms of the winter months. The much-talked-of Parliament of Religions was opened by a Roman Catholic bishop, and an Indian representative recalled the fact that a similar assembly was summoned by an Indian monarch two thousand years ago in the far East. There is nothing new in the world, not even in Chicago. The Psychical Congress was somewhat disappointing, although the respect with which its deliberations were received by the Press indicates a growing sense of the value and importance of the studies which a short time ago were regarded as the favourite jest of the man of the street. If we remember that the motive of the "Pickwick Papers" was to ridicule the absurdity of the meetings of the British Association, we can form some estimate of the rapidity with which opinion moves when once people discover that they are dealing not with theories but with facts.

The Viceroyalty of India seems to be going a-begging. After considerable difficulty Government offered the post to Sir Henry Norman, the present Governor of Queensland. Sir Henry Norman, who is sixty-five years of age, at first accepted it, but subsequently, on the eve of the acceptance of his resignation as Governor of Queensland, he telegraphed that reasons of health rendered it impossible for him to go to India. Lord Brassey, who has just started for India on the Opium Commission, was suggested as a substitute, but at the present moment of writing no fresh appointment has been officially announced. There is a general feeling that things are not going on well in India. The revival of the old feud between the Mussulmans and the Hindoos about cow-killing causes uneasiness, and no one can say at present what will be the ultimate result of the closing of the mints. In the midst of the general uneasiness, the fact that a distinguished Indian officer—Sir Mortimer Durand—is on his way through the Afghan passes to the Court of the Ameer at Cabul does not tend to increase the complacency with which affairs in India are regarded at the present moment. So far all has gone well; but the Afghans are queer folk to deal with.

Just as I am going to press I receive the news of the death of Professor Jowett. He was a great Englishman, who believed greatly in England; and Oxford will never be the same to most men now that the Master of Balliol is no more.

DIARY FOR SEPTEMBER.

EVENTS OF THE MONTH.

- Aug. 31. Case of Cholera discovered at Grimsby.
Deputation to Mr. L. Courtney from the Women's Emancipation Union, on the enfranchisement of Women.
Deputation to Mr. John Morley on the Irish Sunday Closing Bill.
- Sept. 1. Deputation of Cabirivers to Mr. Asquith on their Grievances.
Freedom of the City of Waterford conferred on Lord Roberts.
2. Revision of the Belgian Constitution complete.
3. Conference of the Independent Labour Party at Belfast.
Deputation of Jewish Bakers to the Chief Rabbi on their Hours of Work.
Second Ballot in France.
Meeting of London County Council Employés at Southwark Park on Trade Union Wages.
4. Sir Henry Norman appointed Viceroy of India.
Report of the murder of Emin Pasha confirmed.
Fire at Hammersmith; five deaths.
New Wing of the Poplar Hospital opened by Lord and Lady Knutsford.
5. Colliery Riots in Wales and the Midlands.
Annual Session of the Trade Union Labour Congress of Montreal.
6. Mr. C. A. Pearson, of *Pearson's Weekly*, fined under the Lottery Act for his Weather Forecast Competition.
Further Rioting of the Miners.
7. Report received of a Naval Revolt in Brazil.
Further Rioting of the Miners near Pontefract; Soldiers called out, and several Rioters killed.
8. Women's Suffrage Bill passed by the Legislative Council of New Zealand.
First Meeting of the Opium Commission.
Resignation of the Servian Premier.
9. Centenary Fêtes at Dunkirk.
Visit of the German Emperor to Strassburg.
Martial Law proclaimed at Rio de Janeiro.
10. Opening of the Worcester Musical Festival.
11. Opening of the Dockers' Congress at Bristol.
Visit of the German Emperor to Batavia.
12. Liberation of M. Charles de Lesseps.
News received of a Rising in Uganda in June.
Conference on International Rights at The Hague.
13. Bombardment of the Forts at Rio de Janeiro by the Insurgent Fleet.
Anti-Taxation Riots in Spain.
14. First Meeting of the Royal Commission on Agriculture.
General Strike of Miners decided on in France.
15. Deputation of the Unemployed to Mr. Fowler.
Opening of the Central Hall of the Working Men's Club and Home Reading Union by Lord Brassey.
Conclusion of the Worcester Musical Festival.
Continued Floods in Spain.
16. Last sitting of the Opium Commission.
Close of the Army Manœuvres.
Riots in Prague.
Opening of the Mexican Congress.
Railway Accident in the Box Tunnel, near Bath; many injured.
Close of the Dockers' Congress at Bristol.
Labour Demonstration at Liverpool.
The Cherokee Strip, Arkansas, declared open to Settlers.

17. Demonstration at Limerick in favour of granting an Amnesty to Political Prisoners.
Loyal Addresses presented to the Austrian Emperor at Güns.
18. Meeting at the National Liberal Club on the House of Lords and the Home Rule Bill.
Repeated Bombardment of Rio de Janeiro.
19. Fire at White Chapel; five deaths.
Royal Assent given to the Electoral Bill of New Zealand.
Opening of the Session of the Dutch States-General.
20. Fighting reported in Argentina.
The Post of Viceroy of India refused by Sir Henry Norman.
Mining Accident at Dolcoath, Cornwall.

- Dynamite Outrage at San Francisco: two killed.
26. Presentation of the Freedom of the City of London to Sir John Gilbert.
Autumnal Meeting of the Association of Chambers of Commerce opened at Plymouth.
Opening of the New South Wales Parliament by Sir Robert Duff.
Opening Meeting of the Iron and Steel Institute at Darlington.
28. Closing Meeting of the Iron and Steel Institute at Darlington.
Public Meeting at Paddington advocating the Abolition of the House of Lords.
New Public Library opened at Canning Town.
Annual Statement of Mr. Diggle to the London School Board.

SIR HENRY NORMAN, G.C.B.

(From a photograph by F. Adelle and Young.)

- Conference of the Highland Land League at Glasgow.
National Coffee Tavern Association Conference at Rochdale.
21. New Colours presented to the Dutch Army.
Conference of the Institute of Journalists opened at Lincoln's Inn.
Conference of Lord-wives at Westminster.
22. Budget Statement in the Second Chamber of the Dutch States-General.
23. Deputation of Unemployed to the Lord Mayor.
Co-operative Congress at Nottingham.
Deputation of Railway Employés to Sir G. Rake-Powell, on the Employés' Liability Bill.
Conclusion of the Elections in Natal.
Dynamite Outrage at Facchina.
24. Arrest of Anarchists at Vienna.
Revised Bombardment of Rio by the Insurgents.
25. The Freedom of the Borough of Inverness presented to Lord Roberts.

The Andreas Hofer Monument at Innsbruck unveiled by the Austrian Emperor.
New Draft Treaty and Convention presented to the Siamese Government.

29. Meeting of the Miners' Federation at Chesterfield.
Alderman Tyler elected Lord Mayor of London.
Poor Law Conference, at Lancaster.
Pallas, charged with the Bomb Outrage at Barcelona, sentenced to death.
30. Foundation Stone of an Industrial Institute for the Blind at Fulwood, laid by the Countess of Derby.

TRADE UNION CONGRESS AT

BELFAST.

- Sept. 4. Opening of the Trade Union Congress at Belfast. Appointment of Officials, etc.
5. Address by the President, Mr. Samuel Moore.
6. Resolution carried by 150 to 52 in favour of the establishment of a Fund for the Payment of Labour Candidates, and demanding that Candidates should approve of the Collective Ownership of the Means of Production and Distribution.
Mr. Keltie Hardie's Motion requiring that Labour M.P.s should sit in Opposition to the Government rejected by 119 to 16.
7. Resolutions carried in favour of Old Age Pensions, Legal Eight Hours Day, Jury Laws Amendment, Payment of Members, Establishment of a Court of Criminal Appeal, Landretries and the Factory Act, Federation of Trades, and the Abolition of Contractors and Sub-Contractors in Government Works.
8. Resolutions carried in favour of Limiting Work for the Unemployed under Government, and the carrying out of the "Fair Wages" Resolution of the House of Commons, etc.
Resolution in favour of Labour Reform Demonstrations on the first Sunday in May, defeated by 60 to 58.
Mr. Lewis welcomed Parliamentary Secretary.
9. Resolutions passed in favour of Compulsory Boards of Arbitration, Registration Reform, Improvement of Artisans' Dwellings, and Local Control of the Police, etc.
Conclusion of the Congress.

LIBRARY ASSOCIATION MEETING AT ABERDEEN.

- Sept. 5. Inaugural Address by Dr. Garnett.
Mr. A. W. Robertson on the Public Libraries of Aberdeen.
Mr. J. F. Clark on the Statistical Accounts of Scotland.
Mr. George Walker on Aberdeen; its Literature, Bookmaking, and Book-circulating.

6. Mr. F. T. Barrett on the Catalogue of the Peabody Library at Baltimore.
Discussion on the "Blacking-Out" of Betting News.
Mr. Mason on a New Method of Arranging a Lending Library.
Mr. F. J. Burgoyne on Practical Difficulties in Library Work.
Mr. J. J. Ogle on District Public Libraries.
Mr. Butler Wood on the Village Libraries in Yorkshire.
Mr. MacAllister on the Issue of Fiction.
7. Miss James on Women Librarians in America.
Mr. Southern on the Taxation of Public Libraries.

BRITISH ASSOCIATION AT NOTTINGHAM.

- Sept. 13. Opening Address by the President, Prof. Burdon-Sanderson.
14. Mr. R. T. Glazebrook on Physical Science.
Mr. G. H. Bryan on the Moon's Atmosphere and the Kinetic Theory of Gases.
Mr. J. J. H. Teall on the Origin of Rocks.
Canon Tristram on the Habits of Birds.
Mr. Henry Seebohm on Geography and Exploration.
Mr. J. Head on Mechanical Science.
Dr. Robert Munro on Man's Erect Attitude and the Brain of the Savage.
18. Prof. Lodge on Electrolysis and Electro-Chemistry.
Prof. Reynolds on Medical Education and Comparative Chemistry.
Mr. C. R. Markham on Geology and Physical Geography.
Prof. Joseph Shield Nicholson on Classical Political Economy.
16. Prof. Rüchker on the Magnetic Shielding of Two Concentric Spherical Shells.
Prof. Brögger on the Rocks at Grau, near Christiania.
Dr. C. Vachell on the Protection of Wild Birds.
Dr. J. H. Gladstone on Ancient Metal Implements from Egypt.
Prof. V. Lewes on Spontaneous Combustion.
19. Prof. A. W. Reinold on Earth Tremors.
Discussion on Fossil and Recent Coral Reefs.
Capt. Williams on Uganda.
Mr. J. B. Firth on Nottingham Lace and Fashion.
Mr. J. A. Strahan on the Progress of the Newspaper Press.
Mr. A. T. Snell on the Utilization of Waste Water Power by Electricity.
Prof. V. Horsley on the Physiology of the Nervous System.
19. Prof. J. V. Jones on Standards of Low Resistance.
Mr. W. B. Croft on the Teaching of Physics in Schools.
Discussion on Explosions in Coal Mines.
Prof. F. Clowes on the Miner's Safety Lamp.
Prince Krapotkin on the Glaciation of Asia.
Mr. W. S. Bruce on an Antarctic Voyage.
Discussion on the Currency Problem.
Dr. Munro and Prof. Foyd Dawkins on Lake Dwellings.
20. Dr. R. W. Folkin on the Distribution of Disease in Africa.

PARLIAMENTARY RECORD.

HOUSE OF LORDS.

- Aug. 31. Discussion on the Commons' Amendments to the Lords' Amendments of the London Improvements Bill.
1. Third Reading of the Contagious Diseases (Animals) (Swine Fever) Bill.
First Reading of the Home Rule Bill.
4. Discussion on the Welsh Intermediate Education Scheme.
5. Debate on the Second Reading of the Home Rule Bill; Speeches by Earl Spencer, Duke of Devonshire, and others.
6. Debate on the Home Rule Bill continued by the Duke of Argyll, Lord Playfair, Lord Ashbourne, Lord Londonderry, Lord Cross, Lord Ripon, and others.
7. Debate on the Home Rule continued by Lord Selborne, Lord Rosebery, Lord Balfour of Burleigh, Lord Thring, Lord Swanssea, Marquis of Waterford, Lord Dunraven, Lord Sandhurst, and others.
8. Debate on the Home Rule Bill continued by Lord Cranbrook, Lord Herschell, Lord Halsbury, Bishop of Ripon, Marquis of Sills-

bury, Lord Kimberley, and others; and Rejection of the Bill by 419 to 41.

11. Second Reading of the Women's Suffrage Bill negative.
22. The Consolidated Fund (Appropriation) Bill passed.

Adjournment of the House until November 9.

HOUSE OF COMMONS.

- Aug. 31. Debate on the Third Reading of the Home Rule Bill continued by Sir Charles Russell, Mr. Plunket, Mr. Dillon, Mr. T. W. Russell, Sir Henry James, and others.
- Second Reading of the Naval Defence Amendment Bill.
- Sept. 1. Debate on the Third Reading of the Home Rule Bill continued by Mr. Joseph Chamberlain, Sir E. Grey, Mr. T. P. O'Connor, Mr. Balfour, Mr. John Morley, and others; Bill read a Third time.
4. Mr. Gladstone's Resolution concerning an Autumn Session carried by 162 to 95.
Civil Service Estimates.
5. Civil Service Estimates: Mr. Hanbury's Motion for the Reduction of Salaries of Officers of the House of Lords carried by 103 to 95.
6. Civil Service Estimates—Home Office and Board of Works.
7. Civil Service Estimates—Foreign Office Vote, and Colonial Vote.

THE LATE MR. ALBERT MOORE.

8. Discussion on the Coal Riots.
Civil Service Estimates—Colonial Vote, Votes for the Privy Council Office and the Board of Trade.
Third Reading of the Naval Defence Amendment Bill.
9. Civil Service Estimates—Board of Agriculture, Charity Commission, etc.
Third Reading of the Consolidated Fund (No. 4) Bill.
11. Civil Service Estimates; Discussion on the Duke of Connaught's Appointment.
12. Army Estimates—Votes for the Local Government Board.
Third Reading of the Sea Fisheries Regulation (Scotland) Bill, and of the Law of Commons Amendment Bill.
13. Votes for the Office of the Secretary of Scotland, the Lunacy Commission, etc.
14. Votes for Subordinate Departments.
15. Irish Vote.
16. Civil Service Estimates—Science and Art Department, British Museum, etc.
18. Civil Service Estimates—Diplomatic and Consular Services, Colonial Vote, etc.
19. Civil Service Estimates continued.
First Reading of the Appropriation Bill.
Second Reading of the Companies (Winding Up) Bill.
20. Second Reading of the Appropriation Bill.
Third Reading of the Companies (Winding-up) Bill.
21. Indian Budget Statement.
22. Third Reading of the Appropriation Bill.
Adjournment of the House till November 2.

SPEECHES.

- Aug. 31. Duke of Devonshire, at Keighley, on Labour.
- Mr. Asquith, at Althorp, on the Political Situation.
- Sept. 4. Mr. Courtney, at Liskeard, on the Home Rule Bill.
7. Lord Harris, at Bombay, on the Riots.
Duke of Rutland, at Haddon Hall, on the Home Rule Bill.
9. Sir E. J. Reel, at Elswick, on the Navy.
10. Mr. Woolfall, at Hanley, on the Coal Strike.
11. Col. Howard Vincent, at Sheffield, on the Home Rule Bill.
12. Mr. Keir-Hardie, at Caning Town, on the Unemployed.
13. Mr. John Burns, at Bristol, on Strikes.
14. Sir G. Osborne-Morgan, near Buxton, on Welsh Education in the House of Lords.
20. Sir G. Osborne Morgan, at Shrewsbury, on the Home Rule Bill and the House of Lords, etc.
Lord Londonderry, at Sunderland, on Home Rule.
21. Bishop of Perry, at Westminster Abbey, on Masonalaid.
Lord Cross, at Tarrow, on Parish Councils.
Sir Michael Hicks-Beach, at Bristol, on the Church of England.
22. M. Zola, at the Institute of Journalists, on Anonymity in Journalism.
Mr. H. H. Fowler, at Wolverhampton, on Local Government.
23. M. Zola, at the Institute of Journalists, on Schools of Literature.
24. Mr. John Burns, at Battersea, on the Trade Union Congress.
25. Cardinal Vaughan, at Portsmouth, on the Social Problem.
Mr. William O'Brien, at Cork, on Home Rule.
27. Mr. Gladstone, at Edinburgh, on the Home Rule Bill and the House of Lords.
Bishop Creighton, at Leicester, on Disestablishment.
28. Mr. Thomas Ellis, at Festinog, on Welsh Disestablishment, etc.
Lord Armstrong, at Elswick, on the Navy.
Mr. Jackson, at Leeds, on the Home Rule Bill.

OBITUARY.

KING LOBENGULA AND HIS FAVOURITE WIFE.

CHARACTER SKETCH.

LOBENGULA, THE KING OF THE MATABELE.

THE character of Lobengula is interesting in itself, but still more interesting for the light which it sheds upon our own past history. Here, at the end of the nineteenth century, we seem to have the reincarnation of old Penda, King of Mercia, whose name was great in this island twelve hundred years ago. As Lobengula is to-day, so were our ancestors more than a thousand years ago. Lobengula and his Matabele are of the colour of dark bronze; our heathen forbears who "wet their spears" under the command of King Penda were fair skinned, light haired and blue eyed; but excepting in the colouring pigment they seem to have been very much the same. The fascination of all the narratives which come to us from Central South Africa consists in their giving us an insight into the condition of our own land when Christianity was first preached amongst us. The South African Blue Books are often surprisingly like a latter day version of the Anglo-Saxon Chronicle or Bede's "Ecclesiastical History." It is as if we had the seventh century suddenly resuscitated, in order that it might be photographed by the camera of nineteenth century civilisation.

THE FORCES AT THE FRONT.

Whether or not the present crisis results in war or is once more tided over, the situation is intensely interesting. Of all the savage rulers of our day, there is none who stands forth so picturesquely nude as the King of the Matabeles. He has all the greatness, as well as all the grossness, of the savage. And yet savage though he is, we never forget for a moment that he is a man, and a very human man, and human in nothing so much as being at the mercy of circumstances over which he is supposed to have supreme control. If the present strained relations between the two races on the Mashonaland frontier should result in war, it is almost certain that the result will have been brought about, not by the will of Lobengula, but by the obligation to which sovereigns, even in Africa, are subject: that of deferring to public opinion, at least to that section of their subjects who are articulate enough to make themselves heard. Lobengula is old and wise, his fighting men are young and unwise, under the full sway of the hereditary instinct which leads them to regard the shedding of blood as the law of their being. In this, however, civilisation very much resembles savagery. Across an

imaginary frontier line, drawn between the land of Ophir and the land of the Matabele, stand confronting each other at this moment the foremost fighting men of the two races, each impatient for the word to attack. The men at the front are of different colours, different nations, and different religions; one naked, wielding shield and assegai, the other clothed in all the panoply of the most advanced civilisation. They are alike, however, in longing for the signal for action, and both bitterly resent the restraint of the central power.

THE CONTROLLERS AT THE CENTRE.

In his kraal at Bulawayo sits Lobengula, chafing in his heart alike at the folly of the white intruders and the headstrong impatience of his warriors, surrounded by indunas and taking counsel with his witch doctors as to the spells which should be cast and the magic which should be used to prevent the catastrophe which might overwhelm the Matabele kingdom in ruin. We have our Lobengula much nearer home. The Marquis of Ripon, in

the Colonial Office, surrounded by his indunas, casts no spells and weaves no incantations, but he is troubled at heart, and consults from time to time the printed sheets on which are woven the spells of the journalists, who may be regarded as the witch doctors and wizards of our more advanced civilisation. He holds back with a strong hand the dogs of war, who are straining at the leash in Africa. We may depend upon it that if Lord Ripon and Lobengula could have their way there would be no war. But the masters of the situation are at the front, and not at the capitals, and the fateful word, if it is spoken, will not fall from the lips of Lord Ripon, but from those of Cecil Rhodes; and on the Matabele side some rash induna may not unlikely afford the big white chief an opportunity of taking the law into his own hands. Possibly, however, the dispute may be decided, not by diplomacy, but by nature. If the rains come down earlier than November both sides will have a month's respite, and the crisis may pass without bloodshed.

THE ORIGIN OF THE MATABELE.

During the period of suspense which is so hateful to eager spirits on both sides, we may, with advantage, take a glance at the central figure of this strange drama. Lobengula, the son of Moselekatshe, as he used to be called in all the earlier missionary books from which we

From *Pan.*

[September 26, 1893.]

"BEHOLD, THERE ARISETH A LITILE CLOUD OUT OF THE SEA, LIKE A MAN'S HAND."

gain our first information of this region, or Umziligazi as later and more correct information has led us to describe him, is a Zulu. His father more than sixty years since revolted against Tchaka, the founder of the Zulu kingdom. Leaving Natal, where Tchaka brooked no rival, he settled at first in the Transvaal, but being pressed by the advancing Boers he crossed the Limpopo and settled in Matabeleland. There, in the heart of sub-tropical Africa, in a pleasant and well-watered land abounding in great game and free from the tsetse fly, he established a Matabele counterpart to the original Zulu kingdom. The Matabele are as much Zulus as the Americans are English. They are practically identical in race, in manners, in language, and in their social and military organisation. Lobengula is but a more remote Cetewayo. He himself objects to be called a Matabele, always asserting that he and his men are Zulus. The analogy between the split in the English-speaking race and the two branches of the Zulu kingdom is closer than would at first sight appear. The Zulus of Zululand have kept their blood purer than the emigrants who trekked westward under Moselekatshe. The men who formed the impi which destroyed our army at Isandhlwana, and who were subsequently broken up at Ulundi, were men of purer blood than the men who are gathering on the Matabele frontier to-day. Lobengula's impis are only partially made up of the pure-blooded Zulu and very largely of other native races. Many of them have been captured as boys in the predatory raids of the Matabele, and been taught as the Turkish Janissaries to have no other country than that of their victors and no other religion but war.

THE MATABELE POLITY.

The organisation of the Matabele, however, is entirely Zulu. The authority of Lobengula is absolute; he is lord and master of everything and every one in his territory. His word is law, his frown is death. About three hundred thousand men, women, and children call him lord, and among them, and not less among his neighbours on the frontiers, his authority is maintained by means of some ten to twenty thousand fighting men, who form the standing army, and whose chiefs or indunas form a military hierarchy by which the government of the country is carried on. The king in Matabeleland both reigns and governs, but he reigns and governs subject to one condition—he must keep his fighting machine in good order and in good humour. Fighting machines can only be kept in order by being allowed to fight, and hence the annual forays which enable the Matabele warriors to keep their hands in and allow the younger warriors who are coming on to wet their spears and prove their manhood by slaying their fellow-creatures. It is only another form of the principle which prevails in most savage tribes, especially among the head-hunters of Borneo, where a young man is not allowed to marry unless he has cut off the head of at least one fellow-man.

A SOUTH AFRICAN G.O.M.

There is considerable analogy between Lobengula's position in Matabeleland and Mr. Gladstone's in the House of Commons. As long as Mr. Gladstone can hold together his composite majority he can do anything he pleases. In Matabeleland Lobengula is no less absolute, but he is under no less inexorable conditions. The various impis are as so many Gladstonian items, and for the most part are quite as obedient, but they must have something thrown them to destroy. Therein Lobengula must have a strong fellow-feeling for Mr. Gladstone.

The Liberal Party has been kept going for the last sixty years by being perpetually on the warpath. At one time it was the Corn Laws, at another an Unreformed Parliament, then it was a restricted franchise; again it was the Irish Church and the Irish landlords, and so long as the party could be kept chawing up adversaries and abuses it was in a good temper. Of late years, however, its very success and the progress of civilisation in the Conservative ranks has limited the area in which the Liberals can go forth to war, and the narrower the district in which they can make their forays, the more difficult becomes the task of their leader.

A HELPFUL ANALOGY.

Just so it is with Lobengula. When he ascended the throne he could send his impis north, south, east, and west, slaying and to slay, without any human being to say him nay. To-day Khama's country cuts him off from the south and south-west, the Transvaal Republic offers an impassable barrier to the south and south-east, while only within the last few years a hedge of steel has been run along his eastern frontier, cutting off the whole of Mashonaland right up to the Zambesi from the field of his operations. It is therefore not surprising that in his circumscribed area, in which he will have to stew in his own juice, the Matabele feels that it will soon be impossible for government to be carried on, at any rate on the old principles. The more sanguine spirits among the Matabele, as in the Liberal camp, assert that there will be enemies enough left on whom to flesh their swords. The Matabele have the Barutzi north of the Zambesi; and, as for the Liberals, have they not always the House of Lords? On the other hand, the pessimists on both sides point out that this very year the Matabele have tried conclusions with the Barutzi, as the Liberals with the House of Lords, and in both cases it was the other side which got the best of it.

THE DIFFICULTIES OF THE PHOTOGRAPHER.

But a truce to analogies, which, although they may appear fanciful, may nevertheless enable the reader to form some kind of an idea of the politics of Matabeleland. Now let us look at Lobengula himself, that Bismarck of the Blacks, as Mr. De Waal called him. Lobengula has been often described but seldom photographed. The portrait which I publish as a frontispiece was brought from Matabeleland by a recent traveller, who, however, preserves a prudent silence as to how he got it. Efforts have been frequently made to photograph the king, but he has always refused. He said he did not like to be shot at with the camera, and he told Mr. Maund that it would never do for him to be photographed, as his people would believe that part of his soul had been taken away with the picture. On one occasion, however, when in an unwonted good humour, he promised a sitting to Dr. Milledew, but evaded the fulfilment of his pledge by getting up early in the morning and disappearing into space. The doctor followed him for miles, but when he overtook his Majesty the wily old man declared that it was quite impossible, as no king should ever be photographed except in all the paraphernalia of royalty, and as the royal toggerie was at the capital the doctor had to return without the coveted negative.

LOBENGULA AS HE IS.

Word-pictures, however, enable us to form a tolerably clear conception of Lobengula. He is now an enormously fat old man of sixty years of age. His height is not more than five feet eleven inches, but owing to his excessive stoutness he seems to be shorter than he is in reality.

The descriptions of him recall a passage in Judges, which describes how Eglon, the king of Moab, a very fat man, met his death by the dagger of Ehud. When Lobengula sits upon his biscuit-box receiving his visitors, he rests his hands upon his thighs, which are almost covered by the protuberant paunch. Notwithstanding his corpulence, he is, according to all observers, not without dignity. He used to wear breeches and a dirty coat, but he has long since reverted to the more picturesque costume of his own people. When in full dress he wears a broad-brimmed black felt hat, with a bunch of monkey skins round his middle and a sword by his side. Sometimes he variegates this by twisting some blue calico round his shoulders. When he danced—which was in his younger days, for he is now too fat and gouty for that exercise—he was dressed in monkey skins and black ostrich feathers. But these articles of apparel are trifles which only bring into relief the habitual nudity of the monarch.

HIS APPEARANCE.

By far the most vivid picture of life at Bulawayo is given by Mr. Thompson, of Natal, who, together with Mr. Maguire, succeeded in negotiating the concession which brought the British South African Company into being. Mr. Garrett interviewed Mr. Thompson when he was preparing his admirable series of letters "In Afrikaner Land," and Mr. Thompson subsequently wrote a further account of the king and his court in a number of "Greater Britain." After stating that Lobengula was a man who would never be forgotten if once seen, and that he weighs about twenty stone, or 300 pounds, Mr. Thompson proceeds:—"Lobengula walks as I have never seen any other man walk, moving his elephantine limbs one after the other, seeming as if he were planting them for ever, rolling his shoulders from side to side, and looking round in a way that is dreadful to see. He has bulging bloodshot eyes, and when he looks at one, I can assure you it is enough to scare a man offhand." The bloodshot appearance of his eyes, it should be stated, is not on account of any special ferocity on the part of their owner, but to the smoke in the winter time, which brings about a disorder of the eyes which constantly requires medical treatment. The effect, however, is none the less impressive.

A ROYAL RECEPTION.

The visitor, however, does not usually see Lobengula walking; he is generally seated on his chair in the midst of his goats, or lying on skins in his house. Presentation to Lobengula, although less ceremonious than a presentation to Queen Victoria, is much more disagreeable. If you visit him in his house you have to crawl on your hands and knees through a small aperture in the front of his hut as if you were a bee entering a hive. The ordinary place of reception, however, is in the centre of the kraal, where the king administers justice with his indunas round him. In that case, the visitor has to sit in the broiling sun until the business in hand is disposed of. As there are no trees, the only shade possible is afforded by the meat-rack, on which the beef is suspended, and which is the centre of the attentions of millions of flies. If, however, his Majesty accords his visitor a confidential interview he receives him in what is called the buck-kraal. It is his sanctum, and a very unpleasant sanctum it is. It is an enclosure into which the goats and sheep are driven at night-time. The whole place is aromatic with their droppings, in the midst of which the visitor has to squat. No one is allowed to sit in the king's presence excepting on the ground, and

any attempt to sit upon anything else but mother earth is regarded as an insult to the king's Majesty, which might justly be punished with death.

A THRONE ON AN ANT-HEAP.

The dung and the odour thereof are, however, among the trivial discomforts of a reception in Matabeleland.

On one side of the buck-kraal there is a stage or platform made of rough hewn logs. Every morning the flesh of four bullocks, the quantity required daily for the royal household, is placed on this stage. As may well be imagined, the constant dropping of blood from the meat on to the ground has collected millions of ants on that particular spot. While holding a conference, or granting an interview, the King is very fond of sitting on an old condensed milk-box, and leaning against one of the posts of this stage. Lobengula is perfectly impervious to the attacks of the myriads of ants; but the unfortunate white man who has the honour of conversing with the King does not enjoy the same immunity.

Another ordeal through which the visitor has to pass is the risk of ruining his digestion by eating immense quantities of beef and drinking gallons of beer. Mr. Thompson says:—

"White visitors, when paying their respects to the court of Lobengula, are expected to eat three plates full of grilled beef, and to drink three cans of beer, each holding about a gallon. As one plate of beef or can of beer is finished, another follows. Frequently, when his sable Majesty's back was turned, I used to get the little slave boys who hang about the court to assist me; but he caught me at this on one occasion and reproved me, so that I had to resist the temptation in future. All he said was, "Do you think I cannot feed my own dogs?" but that was quite sufficient, coming from the source it did.

THE KING AS LORD CHIEF JUSTICE.

As to the king's character there is a disagreement of opinion, but all agree that he conscientiously devotes himself to the government of his kingdom, according to his lights. In Matabeleland we have personal government in its simplest form. The king sits in person, like the Kadi under the palm tree, administering justice. A recent traveller says:—

"If a stranger approaches he will probably find Lobengula, with six of his Indunas, administering justice. Cases are brought from all parts of the country and are formally argued and judicially decided. The Indunas act as counsel for the parties and take technical points with an ingenuity which would do credit to a British Queen's Counsel, and discuss and debate the cases with great eagerness. Indeed in many ways the Matabele litigation is similar to our own; for although the Indunas fiercely urge the claims of a client while the case lasts, their differences disappear the moment the King's decision is given. During the pendency of a case, moreover, the Indunas keep religiously away from the parties concerned and their friends; but as soon as the case is over they approach the successful or defeated party as if there had been no dispute.

MATABELE LEGAL PROCEDURE.

Mr. Selous, in his interesting book "Travel and Adventure in South-East Africa," published last month by Mr. Rowland Ward, describes the judicial procedure at length, and a very interesting account he gives. Sir Charles Russell and Sir Richard Webster would have found themselves quite at home in the monarch's kraal when the great seacow case was being tried. Possibly, however, they would have been somewhat scandalised by Mr. Selous's method of interrupting the counsel for the prosecution in the following manner:—

"At one point I was able to turn the laugh against Makwaykwi, for when after saying, "It is you, Selous, who have finished the king's game," he went on, "but you are a witch, you must bring them all to life again. I want to see them—all, all. Let them all walk in at the kraal gate, the elephant"

and the buffalos, and the elands." I stood up and called out, "All right; but when the lions come in will you, Ma-kwaykwi, remain where you are to count them?" This caused a general laugh at Ma-kwaykwi's expense, and quite stopped his flow of eloquence.—("Travel and Adventure in South-East Africa," p. 136.)

Mr. Selous was very indignant at Lobengula's conduct on this occasion, but judging from his own account he does not seem to have had much to complain of. The hippopotamus is strictly preserved by Lobengula, and no one is allowed to kill a sea-cow without his permission. Mr. Selous's servant had shot a hippopotamus when in want of food, and Mr. Selous was tried for the offence. After being fully heard, he was fined about £60, a sum of which he declares he was robbed by Lobengula, chiefly because after the offence was committed he treated him as if nothing had happened. The whole story, even as told by Mr. Selous, seems to indicate a very great desire for justice on the part of Lobengula; indeed, all the accounts which we have of judicial procedure in Matabeleland tend to give us a good impression of the savage monarch.

TENDER-HEARTED DESPOTS.

Indeed, it would not be difficult to idealise Lobengula and make him out to be quite nature's gentleman. Mr. Maund has, for instance, a very high opinion of Lobengula. He seems, notwithstanding all the atrocities for which he is officially responsible, and many of which he personally orders, to have many of the qualities of his father, Moselekatse, of whom Mr. Mackenzie says:—

Moselekatse seemed to be possessed of tender feelings, and keenly alive to the sufferings of others. In order to secure the continued allegiance of his men, Moselekatse had to devise work for them in which they would meet with the gratification of their savage passions. The clamour to be led out to outrage, pillage, and bloodshed never ceased to issue from men forced to live under the restraints of Matabele barracks. Every year a war party marched against some neighbouring tribe; every year multiplied the number of murdered innocents, whose blood cried to heaven for vengeance. But, as a matter of fact, the master spirit animating and regulating all these movements was personally adverse to pain and suffering. Even his oxen Moselekatse did not permit to be lashed with the long whip of the waggon driver; his men were allowed to beat them only with green wands cut from the bushes in the forest. When, some weeks after my arrival, Mr. Thomas on his way to the colony, brought his little children to take leave of the chief, Moselekatse cried out in the most feeling manner, "Take the poor motherless dear ones to the waggon, for I cannot bear the sight!"—"North of the Orange River," pp. 310-311).

HIS EXCUSE FOR KILLING HIS SUBJECTS.

An anonymous writer describes Lobengula as follows:—

His features are aquiline, but very coarse and sensual, and in repose they exhibit great craft and cruelty. But his smile quite changes the character of his face, so childlike and sweet is its expression. His natural disposition is not cruel; but the continued exercise of almost unlimited power over the lives of others has grafted in it a love of bloodshed. The annals of his domestic policy are written in lines as bloody as are those of his foreign conquests—brothers, sisters, nephews, nieces, friends, have all fallen before his ruthless hand.

In the same sense writes Mr. Maund, who has certainly had good opportunities of forming an opinion. He says:—

King Lo Bengula is by no means so black as he is painted (I mean in character). I must differ from those who say he is "deadly cruel." We must not judge him by our standard. He has to rule a turbulent people, who do not know the value of life. Speaking one day to me of killing, he said, "You see,

you white men have prisons, and can lock a man up safely. I have not. What am I to do? When a man would not listen to orders, I used to have his ears cut off as being useless; but whatever their punishment they frequently repeated the offence. Now I warn them—and then a knobkerrie man never repeats his offence." This, for a savage, was fairly logical. It may appear to us cruel; but remember how short a time it is since we hanged for sheep-stealing, and certainly the savage execution with the knobkerrie is not so revolting, and is less painful than a civilised execution refined with electricity. A blow on the back of the head, and all is over. I have now paid him three long visits at a very trying time, and I must say that throughout he has behaved splendidly to the white men. I only judge him by his acts. Constantly he used to send me oxen and sheep, keeping me supplied with them for months.

"THE MAN WHO DRANK THE KING'S BEER."

On the other hand, Mr. Thompson gives a ghastly account of the way in which Lobengula sometimes inflicts torture. The writer says:—

I remember once, when I was waiting for an audience, I saw a man brought in who was guilty of having drunk some of the King's beer. It was at the time of the great dance, when for a month there is a special licence, and when any one carrying beer about is likely to have it raided. But this man had letted toll on the King's beer, when it was being carried by the King's women. The poor wretch was brought before the King. He was horribly afraid. His eyes stuck out of his head, and his knees knocked together as he tried to make obeisance. The King bade them hold him fast; then he said, looking the culprit up and down, "You have a nose and a mouth, and two ears and two eyes. You have used your nose to smell King's beer—turning to attendants—"cut off his nose!" They cut off the man's nose. "You have used your mouth to drink King's beer; cut off his mouth!" They cut off the man's lips. He was a horrid sight. Lobengula waited a moment. Then he said deliberately: "You have heard that it is not allowed to drink King's beer; but your ears are no good to you." Off went the poor wretch's ears. He looked at the King with a look dreadful to see. "Your eyes—cover up his eyes!" shouted the King. "Put his forehead over his eyes that he may not see King's beer!" and they cut the forehead of the man, and turned down the flap of skin as a surgeon might turn it, so that it hung over his eyes. Then the King looked at the man for a few minutes, and the man grovelled before him in the dung, until suddenly the King fell into a rage—perhaps he was ashamed of himself—and bade them beat the man with logs of wood. They beat him within an inch of his life. Last, the poor wretch mustered strength to crawl away, like a broken snake, along the ground; and he went and lay under a waggon until nightfall. Then he crept down to the stream to bathe his wounds. He came close past my waggon, and you never saw such a ghastly sight as he was. The flap of skin hung over his eyes, but it was dried and stark.—("In Afrikanerland.")

THE MOST HARD-WORKED MAN IN MATABELELAND.

This story is well told, and there seems to be no doubt that however kindhearted Lobengula may be personally, he is as indifferent as a schoolboy to the pain which he inflicts, or a scientific vivisector is in torturing a frog. It would, however, be a mistake to judge him by our standards. There is no reason to believe that he is more indifferent to the infliction of torture and death than the men in the midst of whom he lives and was brought up. Like the Emperor of Russia, he had no ambition to occupy the throne; he accepted the position philosophically, but in the opinion of Mr. Maund he would much rather be a farmer than a king. The first-born, Kuruman, disappeared, and hence in Matabeleland, as in Russia, the second son came to the throne. As King of the Matabele, he is one of the largest stock-owners in the world,

as his whole kingdom may be said to be his ranch. A writer in *South Africa* says:—

The King is one of the most intelligent men in his nation. His memory is prodigious, and, when he chooses to exert it, he has great tact and natural politeness. He has social qualities, too, and likes a good chat. He often unbends with his courtiers; but they are ever on the *qui vive* to say only what they know will please, and are careful never to contradict him. The duties of the King are no sinecure. He is the most hard-worked man in the nation. From morning till night he is hearing reports from all parts of his dominions, arranging the settlement of difficult law cases, judging criminals, and transacting farm business. He is a farmer on a gigantic scale, for he has the control and management of all the nation's cattle. He is the centre from which everything radiates, and to which all things converge in Matabeleland. The destruction of an impi, or the death of a calf at some cattle-post, are alike reported to him with minutest details.

A PICTURE OF THE KING IN HIS KRAAL.

The author of "Matabeleland and the Victoria Falls" gives a very bright picture of the scene in the King's kraal when Lobengula is receiving visitors. He says the scene with the King sitting on his biscuit-box would make a picture:—

The setting sun; the dark green trees beyond the kraal and the green walls of the newly-erected kraal; the yellow beehive-like huts; the yellowish trodden grass in the space; the herds of goats and sheep, with lambs and kids, and pack of dogs, crowding round the King's waggon; the group of natives, some all but naked, some adorned with feathers, some with a single article of European dress, as a hat, crouching on their haunches, forming the court of the black King; tusks of ivory lying about. To complete the picture, a white trader or two should be introduced, not above crouching before his sable majesty, who sits there in his broad-brimmed black felt hat, pipe in mouth (a small briar-root, worth perhaps 2d. at home)

A KING'S DIET.

Lobengula smokes constantly, smoking great quantities of Boer tobacco. In fact, he may be said to live on beef, beer, and tobacco. Mr. Thompson gives the following account of his diet:—

In the early morning, if the weather be cold, he takes a pannikin of black coffee, well sugared. Between this and about eleven o'clock he may have a few drinks of beer. At eleven he has breakfast, which consists of grilled or steamed beef, with beer afterwards to wash it down. Occasionally he may have a small dish of mashed pumpkin or beans, or some other vegetable, placed before him. He has similar courses for dinner about three p.m.—that is, if he wants any dinner—and supper at seven p.m. Before breakfast he washes his

hands and face, using soap, in a basin which is brought to him by one of his slaves. After his ablutions, another slave brings forward the meat, which is heaped on a large wooden ashet, which the slave holds, kneeling, in front of his royal master till he has finished. He picks out the dainty bits, and throws the remainder either to his dogs or slaves. He uses a knife, and his fingers usually serve the purpose of a fork, although I have seen him use the latter instrument occasionally. After feeding, instead of wiping his greasy fingers with a table napkin, he rubs them over his bare arms and legs. Lobengula does not require a tonic to assist his appetite. To his meat he seldom uses salt, the gall of the animal, which is poured on the meat when put into the pot, serving that purpose. It is also supposed to make the meat tender.

Although he drinks quantities of beer he takes no spirits, and all the champagne which is given him he hands over to his wives, of whom he has comparatively few.

THE ROYAL HAREM.

He is said to take four new wives every year, but in reality he has only ten wives and about eighty concubines. As his father Moselekatse is said to have had five hundred, Lobengula may be said to have made considerable progress towards monogamy. It is a curious fact that none of his real wives have children, and the next king of Matabeleland will have to be taken from among the sons of the concubines. When he is sitting in his sanctum drinking beer he usually has five or six of his favourite wives sitting in front of him. When he is making a progress throughout the kingdom he dispenses with the difficulty of having to carry about with him his harem by stationing squads of wives in various parts of the country. They are so distributed that he cannot turn up in any place without having a certain number of wives waiting for him.

THE KING'S SISTER NINI.

Matabele women are by no means uncemely in their youth. The portrait accompanying of the young princess appointed to marry a neighbouring potentate would compare very favourably with any English girl. The tendency to *embonpoint* is a very noticeable feature in the Matabele female. To be in the fashion you must be fat, and when kings and queens set the example it is only natural that subjects should follow suit. In the early days of the reign the King's sister Nini was the real queen of Matabeleland. The following description of her appearance at a great state function may be regarded as describing the Matabele conception of female beauty:—

Suddenly the royal sister appeared, and presented a most singular, not to say magnificent appearance. It was something

A MATABELE PRINCESS.

like the appearance of the *prima donna* at the opera, or the leading spirit in some gorgeous pantomime. She is very stout and tremendously *en bon point*, and her skin is of a coppery hue. She wore no dress, and the only covering above her waist was a number of gilded chains, some encircling her, some pendent. Round her arms were massive brazen bracelets. A blue and white Freemason's apron appeared in front, and looked strangely anomalous there, though really not unbecoming. From her waist also there hung down behind a number of brilliant-coloured woollen neck wraps, red being the predominant colour. Under the apron was a sort of short black skirt, covering the thighs, made of wrought ox-hide. Her legs and feet were bare, but round her ankles were the circlelets of bells worn by the women to make a noise when they dance. Her head-dress was decidedly pretty—a small bouquet of artificial flowers in front, and amongst the hair, standing in all directions, feathers of bee-eaters' tails. A small circular ornament, fashioned out of red clay, was on the back of her head. She put herself in posture for the dance, but did not move very much or energetically whilst keeping time; she suffered too much from adiposity. She held one of the large oval black and white ox-hide shields surmounted by a jackal's tail, such as are carried by the warriors.

A SUDILEN AND BLOODY END.

Nini for a long time ruled the roast in Matabeleland and got rid of her enemies by bringing accusations of witchcraft against them. However, at last she overstepped the mark, when from jealousy of one of her sisters-in-law she brought an accusation of witchcraft against her. Unfortunately for Nini, Lobengula was very much in love with his wife, and it did not take much to persuade him that if there was witchcraft the witch was no other than Nini herself, thereupon the days of Nini were brought to a sudden and bloody end. The wives breathed freely again when they heard their terrible sister-in-law was no more. Mothers-in-law in Matabeleland are not allowed to enter the houses of their daughters' husbands, and if they accidentally meet them in the streets they must look another way. From this it is evident that the Matabele have made considerable progress in civilisation. In the butchery by which Lobengula maintains his authority he by no means spares his relatives. Shortly before Mr. W. Montague Kerr visited Bulawayo, Lobengula had put to death his uncle Usiquiana and destroyed his kraal numbering forty people in all.

THE CURSE OF WITCHCRAFT.

It is impossible to form any estimate of the character or rule of Lobengula without taking some account of his exploits in witchcraft. It is only on reading of the way in which witchcraft is practised in savage tribes that we begin to understand the reason for the interdict which is placed on it in the Levitical Books. Khama, stern old Puritan that he is, has peremptorily put down witchcraft in the whole of his dominions, for witchcraft in these countries is by no means a harmless table-rapping or an invocation of spirits—good or bad. It is a system of terrorism which cuts up by the roots the very rudimentary beginnings of civilisation and religious liberty. To accuse your enemy of being a witch, or of practising witchcraft, is a simple and well-understood formula for compassing his death. Evidence is not required of the guilt, neither is the accused party allowed to rebut the accusation brought against him. Treachery, no matter how hideous, murder, no matter how foul, is held to be excused by the simple allegation that the victims had been practising witchcraft. Witchcraft, like charity, covereth a multitude of sins. The practice of witchcraft, however, is a much more serious thing than the mere bringing of false accusations against innocent men.

LOBENGULA AS WIZARD.

Lobengula is at least no fool, but one of the shrewdest men in all savagery. He is hard worked, but he always finds time for his incantations. Every day, no matter how much he may have drunk with his wives the night before, he is up before sunrise to inspect his cattle and flocks with the vigilant punctuality of a Scotch shepherd. Having done this he retires to his sanctum and practises magic. Mr. Thompson says:—

Here he cooks Devil's broth, which is made out of crocodile livers, hippopotamus fat, snakes' skins, birds' beaks, fat frogs' toes, and several other things. While the steam of this infernal compound ascends, he is supposed to petition the gods for what he may most desire.

One of the most solemn functions of the King as a magician is the making of rain, in which he is an adept. Mr. Thompson seems to think that all his rainmaking is only a clever make-believe of a weather-wise student of meteorology, but this is somewhat doubtful.

A ROYAL RAINMAKER.

Mr. Thompson gives one or two stories as illustrating the kind of exploit by which the King obtains his reputation:—

The King has the reputation of being a remarkably good hand at making a thunderstorm, and in this he gives way to no man. I remember one day in June—the one month in the whole year in which you least expect rain—some natives had brought a large python into camp, and were singing some of their rain songs. It is sudden death to any native in Matabeleland who, if he sees a python, does not by some means or other manage to secure it and bring it in alive. The King took possession of the reptile, and said he must go and make rain. I laughed at this, and said I did not think he could do so, to which the King replied, "You will see." The python was skinned alive, its liver taken out and cooked, and the usual rainmaking rites performed. Curiously enough, just before sundown the sky clouded over, and soon afterwards one of the heaviest thunderstorms I had ever seen broke over the place. Next morning the King asked me if a white man could make a thunderstorm like that? I said, "No, King; if we could get you down amongst the farmers in the Karoo we could guarantee you a fortune."

He gives us his own explanation of the mystery: that Lobengula expected the rain from the fact that the wind had veered round and had blown for three days from the west, which is an almost sure sign that there will be rain on the fourth day. That, however, does not explain the coincidence of the discovery of the python; without it there would have been no attempt at rainmaking that day. Besides, Lobengula frequently tries to make rain when drought is persistent. Then presents of cattle are brought in and whole kraals of suspected subjects are killed. Evidently the doctrine that there is an Achan in the camp when things go wrong is a very favourite one with the Matabele. The belief in witchcraft influences the whole of Matabele life. The king's wooden platter, for instance, is never washed out for fear of witchcraft, with the result that it is covered with a thick cake of fat about an inch deep. The king is perpetually travelling about, lest he should become the victim of malignant spells of malevolent magicians. When the army goes to war it is doctored, and the custom of smelling out is in full force. There is a strong belief in Matabeleland that there is no religion but witchcraft, and Lobengula is its prophet.

CHRISTIAN MISSIONS IN MATABELELAND.

Christianity never seems to have been able to make much impression upon the natives. This is not because

of persecution, for the missionaries seem to have been very well received. Mr. Mackenzie's account of the first preaching of Christianity before Moseleka's is very interesting:—

The missionaries were able to commence preaching to the Matabele. The first services were held in the large cattle pen of the town, and were attended by great numbers of the soldiers. Moselekatse was also present, and showed his knowledge of Sechuana and the doctrines of the Word of God, as previously taught him by Mr. Moffat, by occasionally interrupting the interpreter and helping him with the right word. As every utterance of Moselekatse is applauded, these corrections were received with the usual demonstrations, every soldier present shouting out "Great king!" etc., in the middle of the sermon. The chief also considered himself bound once or twice to express his dissent from the doctrines which were proclaimed. For instance, when one of the missionaries, some time after their arrival in the country, was preaching concerning the accessibility of God, he said that all might repair to him in prayer, the poor people as well as the greatest kings, and that God would hear the one as soon as the other—"That's a lie!" interjected Moselekatse, who did not like thus publicly to be ranked with the poor and the abject. The missionary was immediately interrupted by the shouts of applause which greeted the emendation of the chief. As he found, however, that his disapprobation did not alter the preaching, and that in every discourse there was a good deal which was unpleasant for him to hear, the Matabele chief did what people in somewhat similar circumstances do in England and elsewhere, he gave up attending the public worship.—("North of the Orange River," pp. 317, 318.)

After the missionaries left, the Matabele continued to hold their meetings, not from any religious feeling, but simply from the spirit of imitation. Moselekatse ordered his Prime Minister to deliver the discourse. It seems to have been done in serious earnest, the performers being as free from any desire to scoff at Christianity as they were from any real belief in its tenets. The white man's service was in their eyes equivalent to their own dances, which they religiously performed, and evidently thought it was well to keep up the custom when once established. After a while the unmeaningness of it all seemed to come home to them, and they dropped it.

THE GREAT DANCE.

The great dance of the Matabele has often been described, but never more vividly than by Mr. Selous and Mr. Thompson. This great dance takes place at the time of the new moon, in February, and a very imposing spectacle it is. Mr. Thompson says:—

On the day of the dance, the troops congregate in five large divisions, and then march to the green in front of the king's kraal, where they form into a semicircle about five hundred yards long and eight or ten men deep, more or less numbering, perhaps, from eight thousand to ten thousand men. In their head-dresses and capes of black ostrich feathers, and kilts made of the skins of leopards and other wild animals, they present a very imposing spectacle. They carry their shields and assegais in one hand, and in the other a dancing stick, with which they every now and then beat their shields, keeping time with their songs, and stamping with their feet in perfect unison. Each division is to be distinguished by the colour of its shields—some white, some black, others red and white, etc.

THE KING AND HIS WIVES.

On the day of the Big Dance Lobengula has to be present most of the time, either dancing himself—a pleasure he does not appreciate, as he is stout and gouty—or looking on. His wives and other high women of the nation also take part in the dancing. They present a very pretty spectacle in their many-coloured clothes and beads, dancing gracefully in front of the regiments, swaying backwards and forwards while singing, and waving supple wands. Every now and then some old or young blood would rush out from the ranks with a yell,

jump and run about like a maniac, stab the ground or air with his assegai, and shout out his former prowess in war, every stab, and the direction of it, showing the number of and manner in which he killed his foes; at each death-blow, if well dealt, being received with loud acclamations of praise by the assembled warriors. The dancing, which is conducted throughout in this semicircle order, is kept up with great vigour from early morning till far into the night. It is hard work, and I have frequently seen the men retiring from the ranks thoroughly exhausted, with the perspiration rolling down their bodies.

THE SACRIFICES.

After the day of the Big Dance is the slaughter-day. An important feature in connection with this day is that of the sacrifice of about twenty black bullocks, which are selected from a sacred herd kept for this purpose. The bullocks are killed in a sacred goat kraal in presence only of the King, the witch doctors, and a few of the chiefs of the country, in order that the sacrificed bullocks may carry messages from the living to their departed relatives and acquaintances in the world of spirits.

The bodies are allowed to lie in the kraal over night, and in the morning they are cut up and the meat cooked and distributed among the various regiments to be eaten along with the other meat. The cooking process is quite a sight. What with the smoke and the steam, the rattle of tongues and demoniac shouts, the heat of the fires and the sun overhead, perhaps it would not require a strong effort of imagination for one to fancy he was in warmer quarters. The meat is distributed in the afternoon, and it is quite a spectacle to see how the soldiers, who perhaps have not had a bite of food for two or three days, devour their portions.

THE THROWING OF THE ASSEGAI.

The last two days of the dance are devoted to drinking beer, of which there are great quantities distributed to the troops, who on these occasions are anything but pleasant customers to be near. On the day of the Big Dance it is customary for the king to throw his assegai out in the "veldt," while his regiments follow in his rear. Whatever way the assegai is thrown signifies the direction he intends sending them in the coming season; and immediately he does so they all stab the ground, and declare their willingness to follow to the death his orders. The dance may be termed the dance of the "Purification," as on the day of the Big Dance no blood must be shed, and the people bathe in the river early in the morning. It might also be called the festival of the first-fruits of the nation, as no one eats any of the fruit of the land till the king has first partaken of it. On the day the regiments disperse for home, they burn the huts which had been their temporary home to the ground.

AN IMPOSING SPECTACLE.

Writing of this dance, Mr. Selous says:—

The greater part of the Matabele are physically a fine tall race of men. They look magnificent, and when standing in a semi-circle round their king, with their large ox-hide shields in front of them, must present, I should think, as imposing a spectacle as any race of savages in the world. The dancing lasted three days, during which time a great many oxen were slaughtered for the assembled people, and immense quantities of beer were drunk. Every downward thrust made with the assegai represented a life taken, and at every stab the warriors all hummed out with one accord the word "Jee." One man I watched had seventeen lives to account for, another fifteen, and so on. At last the king came from the inner kraal, and advancing into the circle stood in the midst of his warriors, dancing quietly by himself. He was dressed in monkey skins and black ostrich feathers, and really looked a king. Presently the king walked in the midst of his plumed army to the open ground outside the kraal, and performed a portion of the ceremony, which consists in throwing an assegai, and then running forward and picking it up again. As he did this all the warriors ran forward as well, striking the insides of their shields at the same time with the butt end of their assegais, and producing a noise literally like thunder.—("A Hunter's Wanderings in Africa," pp. 54, 55.)

THE MATABELE AT MEAT.

The spectacle of the Matabele feeding must be revolting indeed. Groat hunks of meat are passed round to, say, parties of a dozen or more, each of whom as it passes him tears out as big a piece of the round of beef as he can get hold of with his teeth, and then bolts it with such expedition as he can in order to be able to take a second bite when it is passed round again:—

But if it is very large, and the party are not numerous, they may be seen seated in a circle, supporting the meat by their hands in the centre, while they all simultaneously tear and pull away at it with their teeth in fine style.

LOBENGULA AND THE WHITES.

During this dance Lobengula has been frequently appealed to to sanction an attack upon the white men. This he has hitherto parried very adroitly. Some seven or eight years ago a writer to a Cape newspaper was present during the dancing, and thus records an incident which is not of unfrequent occurrence:—

After we had looked with much interest on the scene for about half-an-hour, there suddenly leaped to the front from the ranks a tall yellow Induna, brandishing his spear and other arms about, and addressing the interpreter of the King in a loud voice said: "Ask the King what those white people have come here for!" Old Lo Ben instructed the interpreter to tell him: "These white people have come here on their own authority, and they only come to look on." The excited Induna replied: "Tell the King that I say he lies; let him leave these three whites to us for a few minutes, just to bathe our spears in their blood; let him do this; then we shall be convinced that he loves us more than the whites." Old Lo Ben was about to burst with anger, and it was a horrible sight to see his ugly eyes rolling about. He replied to the impudent Induna: "You may have those three whites (the correspondent, Grobler, and Mackenzie), but you must first go to the Gold Fields and Diamond Fields, and wash your spears in the blood of all the whites there, exterminate them everywhere, and when you have finished your work you can have these three whites too."

MOSELEKATSE ON THE ENGLISH.

Whatever vices Lobengula may have, all agree that he has been faithful to the white men in good report and in ill. In this he was a true son of his father Moselekatse, who on one occasion thus addressed his subjects concerning the English:—

These are the masters of the world. Don't you take notice how they sleep in the open country alone and unprotected, and are not afraid? They are in my country one day; they pass on to the towns of other chiefs; they go fearlessly, for they bear no malice, and are the friends of all. And when the great men in the white man's country send traders for my ivory do you think they give me beautiful things in exchange because they could not take the ivory by force? They could come and take it by force, and all my cattle also. And yet look at them! They are humble and quiet and easily pleased. The English are the friends of Moselekatse, and they are the masters of the world.—("North of the Orange River," p. 312.)

THE OPENING UP OF MATABELELAND.

Lobengula was much troubled in mind by the reverses which we experienced in the Transvaal war. The Boers he knew and disliked; the Portuguese he knew and despised. It was not until Sir Charles Warren's expedition that the English began to press upon Matabeleland. No sooner was the question of opening up the mines of the land of Ophir decided on, than concession-hunter after concession-hunter insisted that Lobengula should give them the right of digging for minerals. He refused to give any permission, and in this he adhered to his father's policy. Mr. Mackenzie tells us:—

As soon as the discovery of gold was announced in the

south an ambassador from the Transvaal Government visited Moselekatse to obtain authority over the gold field in behalf of the Transvaal Government. But the old chief would not yield. "Your people may come in and take away this stone (quartz) as they may take away ivory in their waggons. They may load up as much as they please of it, but on no account are they to bring with them a Dutch woman, a cow, a ewe or she-goat, because the permission is to carry away stones, not to build houses and towns in my country."—(*Ib.* p. 333.)

LOBENGULA'S LETTER TO THE QUEEN.

Besieged as he was by concession-hunters, threatened by the Boers and Portuguese, Lobengula one day told Mr. Maund, who was seeking a concession on the ground then occupied by the Portuguese, to take two of his indunas to see whether the White Queen was living, "for they tell me," he said, "that the White Queen no longer exists, and that is why the white men come here and bother me. I want you to take two Indunas with you to see whether the White Queen is living." Mr. Maund hesitated at first, but the next day he thought it would be well to accede to the King's request, and in a couple of days Mr. Maund with two old Matabele started for Cape Town.

The following is the text of Lobengula's letter to Her Majesty:—

"Lobengula desires to know that there is a Queen. Some of the people who come into this land tell him there is a Queen, some of them tell him there is not.

"Lobengula can only find out the truth by sending eyes to see whether there is a Queen.

"The Indunas are his eyes.

"Lobengula desires, if there is a Queen, to ask her to advise and help him, as he is much troubled by white men who come into his country and ask to dig gold.

"There is no one with him upon whom he can trust, and he asks that the Queen will send some one from herself."

THE INDUNAS.

One of the emissaries was Babjaan, an old man of seventy-five and a relative of the King's, whose life he had saved at the great battle at the commencement of his reign. The other man was Umsheti, a small, gouty, bad-tempered fellow of sixty-five, who had elephantiasis in one leg, and a weak heart. Lobengula paid all expenses. They started naked, but by the time they reached Cape Town Mr. Maund had succeeded in dressing them, but on their way back they undressed and entered their native land in the same condition of nudity in which they had left it. The mission was carried out in Lobengula's usual simple and direct method of dealing with things. He could trust these two indunas, therefore he would send them right across the sea to the presence of the White Queen herself to verify the fact of her existence and to obtain her advice at first hand. To secure obedience to his mandate he told the indunas that if they came back without having seen the Queen they would be killed at once.

IN VINO VERITAS.

It is unnecessary to follow their journey down the country, or to speak of the difficulties which red tape placed in the way of their having an interview with Her Majesty. All difficulties, however, were overcome, and the mission was a remarkable success. Lobengula could not bring himself to believe their report, so again bringing his native cunning to his aid he verified the reports from regions lying far beyond the borderland of the Matabele country by the expedient of making the envoys drunk night after night and interviewing them separately. As their statements agreed, he came to the conclusion that they must be speaking the truth. It is a thousand pities that no shorthand writer was present to take down the

report of these two aged indunas. It more than any other document would have enabled us to understand the difficulty which the savage has in understanding civilised things. The indunas began at the beginning, and went through the whole of their travels surrounded by a listening throng of wondering chiefs.

WHAT THE INDUNAS SAID OF THE SEA.

They found their first difficulty in trying to make the King understand what the sea was. He had never seen the sea, so they told him that it was like the blue vault of heaven at noon, and that the waves rushed on the shore as the impis of the King charged at a review. If the sea was as the firmament above, the steamer or floating kraal was the sun in the heavens, while all round was blue water. They explained the motion of the ship by the statement that the great iron kraal was pushed through the water from behind by the engine. This puzzled Lobengula; he said he could not understand how an iron kraal could float upon the water, and concluded that it must have supports from the bottom, "and you may depend," he added, "that it was by these supports that the kraal was pushed along." His idea evidently was that the kraal walked through the water, its legs being concealed by the waves. This naturally appeared to him wonderful. "Truly," he said, "these white men are the sons of the sea." But sometimes, said the indunas, the blue sea was overcast, and the sea was full like a river in the rainy season. Then the floors and the roofs of the kraal rocked until the white men danced—a picturesque reminiscence of the Bay of Biscay. On their way they passed the Portuguese gate, as they called Lisbon. This too was a great trouble to Lobengula, for how could the great White Queen allow Portugal to be between her and Africa?

THE WHITE ANTS OF LONDON.

But the wonders of the voyage were nothing to the wonders which they saw in England. London, as usual with savages, impressed them more than anything else:—

London they described as the place all white men must come from; people, people everywhere, all in a hurry, serious of faces, and always busy like the white ants. There was not room for any one above ground in this great kraal, for they could see men and horses moving in a stage below, just as they live in houses built one above the other (this referring to Holborn Viaduct). The fire-carriages, too (locomotives), like those between Kimberley and Cape Town, have to burrow in the earth under the streets for fear of being stopped by the crowd.

THE QUEEN'S STOREHOUSE.

They were greatly impressed also by the Bank of England, which they called the "Queen's storehouse." They described how they had been allowed to lift bags of gold, and how it made their hearts sad to see so much gold that they could not put into their pockets. They told how they visited the bullion-room, where there were great piles of ingots, some of which were heavier than Babjaan could lift with all his strength; nor did they omit to remark that the Queen's storekeeper took no notice of their hint that in their country, when any distinguished visitor was received by their King, he usually gave the largest beast in the herd to the stranger. "But," said Lobengula, "the ingots of gold were in stone?" "No," said Babjaan, "they were all ready to be cut into money." "Then," said Lobengula, "why, if the great Queen has so much gold, do her people seek for more?" Then answered the indunas, "It is because the Queen makes her subjects pay so much gold, that they have to go all over the world seeking it, in

order that they may pay their tribute!"—an ingenious explanation, which completely satisfied Lobengula, and led to his pegging out forty reef and two alluvial gold claims in Mashonaland.

THE KRAAL OF THE WHITE QUEEN.

Then they described Windsor, and said how they had seen the great White Queen, whom it was easy to recognise from her manner and bearing. They told how the Queen's soldiers were clothed in iron, and on either side of the approach to the Queen's castle so motionless did they stand that the indunas believed that they were stuffed, until one of them saw their eyes moving. The White Queen was the greatest woman they ever saw, but the most beautiful was Lady Randolph Churchill. They were taken to the Zoological Gardens, where they somewhat resented not being allowed to poke the lions with their umbrellas; also the Alhambra, where they found the dancing even more to their taste than that with which they were familiar in Matabeleland. Madame Tussaud's delighted them, for all the kings and queens that were shown them they believed represented monarchs who had been conquered by the great White Queen, Cetewayo bringing up the rear. But always they came back to London.

THEIR IMPRESSION OF ENGLAND.

It was like the ocean they said. A man might walk and walk and never get to the end of the houses, nor did they ever get over their marvel at the number of Englishmen. If every Englishman was killed at the Cape, for every drop of blood from their bodies a fresh man would spring up, they told their king. They described the manoeuvres they saw at Aldershot, and repeated over and over again their first burst of enthusiasm over the horses so big and so strong, and the discipline of the men. After describing the sham fight, old Babjaan would address the indunas, and told them:—

"Never talk of fighting the white man again, aough! They rise up line after line, always firing. Their little boys, the sons of headmen, all learn to fight like men (referring to Eton boys). Their generals correct all faults; they won't pass a man who is out of time as they dance by in line coming from the fight (the march past)."

THE WITCHCRAFT OF THE TELEPHONE.

But the thing which completely bowled them over was the telephone. They could conceive—though with difficulty—that it was possible for English witchcraft to make a machine which could talk English even when those who talked were a mile from each other, but they could not understand the witchcraft which enabled the English to make the telephone speak Matabele. But that it did they could swear. They had been separated, and at the distance of a mile apart Babjaan had talked to Umsheti by means of this magic, and the machine spoke as pure Matabele as if it had been made in Africa. Another experience of theirs did not turn out so well. They were breakfasted by the Aborigines Protection Society, where they were received, they said, by many white-haired indunas, whose influence with the Government they somewhat exaggerated.

The immediate result of that mission was that, whether owing to the caution of Lord Knutsford and the counsel of the Aborigines Protection Society, Lobengula believed that the great White Queen and the English public opinion were hostile to the granting of the concession to the Chartered Company, and there and then he slew his Prime Minister Lofcha, who had advocated the granting of the concession, and some seventy of his companions.

CAPTAIN FERGUSON'S MISSION.

It was then decided to send a guardsman envoy out with presents. The chief aim of this mission was to undo as far as possible the mischief occasioned by Lord Knutsford's hint that the King should not give away all his land to the first comer. There is a difference of opinion as to the impression produced by the uniform of the Guards which Captain Ferguson wore; some said it did good because it proved to Lobengula that his indunas had not lied when they stated that the Queen clothed her soldiers in iron; others assert that it made a bad impression upon the

pressed to perform his promises he drew back. Mr. Selous in his new book says:—

When Mr. Doyle reminded him of his promises to Dr. Jameson, he avoided any discussion of that question, and only said, "There is only one road to Mashonaland, and that goes through my country and past Bulawayo"; and he further said: "If Rhodes wants to send his men round my country, let him send them by sea to beyond the Sabi river." At last he said to Mr. Doyle, "Rhodes has sent me many emissaries, and amongst them Dr. Jameson, whom I like, and whom I am told is Rhodes's mouth; but I am Lobengula, and I want to see the big white chief himself; I am tired of talking with

THE KING, QUEEN, AND WIZARD OF THE BARUTZU.

King, because he thought it cowardly for a soldier to hide himself behind an iron breastplate, instead of meeting his enemy as a brave man should without sheltering himself behind anything.

THE ROAD TO MASHONALAND.

After signing the concession which brought the South African Company into existence, Lobengula became somewhat alarmed. He had given Dr. Jameson permission to take the pioneers through to Mashonaland. When the time for the occupation came he fought shy, and declared that there was only one road to Mashonaland, and that lay through his country. Dr. Jameson had not only his consent to the cutting of a road to Mashonaland, but also promised to send men to clear the route. When

Rhodes's messengers and the bearers of his words; their stories don't all agree."—(*Travel and Adventure in South-East Africa*, p. 359.)

It was impossible for Mr. Rhodes to come, and they then saw that they had nothing but hostility to expect from Lobengula, and the pioneers marched along the Selous road prepared and expecting to be attacked at any moment.

LOBENGULA AND THE PIONEERS.

The whole country was full of preparations for war, and more than one message was sent by Lobengula which might have deterred less resolute men than those at the head of the expedition. Mr. Selous speaks very frankly on this point:—

Personally Lobengula probably never wanted to fight, though it is the most absolute nonsense to talk of his ever having been friendly to the expedition. But he had a very difficult part to play, and it is wonderful that he managed to restrain his people as he did.

We cut the road to Mashonaland in defiance of them, and our advance would most certainly have been resisted but for two circumstances. The first was the fact that during the progress of the expedition a well-equipped force of five hundred mounted men of the Bechuanaland Border Police were encamped on the south-western border of Matabeleland; and the second, that after the expedition crossed the Tuli, and until it reached the plateau of Mashonaland, Lobengula and his people never knew where we were.—("Travel and Adventure in South-East Africa," p. 381.)

When we had established ourselves in the country and the forts were built it was too late, and Lobengula made the best of a bad bargain.

AFTER THE SETTLEMENT OF MASHONALAND.

The last two years things have gone pretty smoothly, and there have been no serious complaints on either side. The last published Blue Book does not show the old man to disadvantage, with one characteristic exception. On the whole he plays rather a dignified part. The exception is the report dated July 5th, 1892, announcing that the King had had the Regent and the Regent's brother killed, and that their sons, wives, and children were all being killed, their dogs were also killed, but all the cattle and slaves were captured. They were accused of witchcraft. The Regent was strangled, and his brother was shot, and the King had given orders to clear out the whole family. He had also sent an impi to kill his brother Mollhapini. The Regent was, in the interpreter's opinion, the best and the least harmful man in the country, but he was powerless against the accusation of witchcraft. The execution of the Regent, however, was one of those internal affairs with which we have nothing whatever to do. If we take into account the civilisation of the two men, Lobengula's conduct would probably be less blameable than that of Captain Lindy.

THE KILLING OF NGOMO.

Ngomo was a chief occupying a kraal near to Fort Salisbury. Some natives belonging to this kraal were accused of stealing from the farm of an Englishman. Ngomo was then summoned to surrender that he might be taken to Salisbury to be tried. When Ngomo did not give himself up to be tried for the offence committed by some of his men, Captain Lindy determined to make an example of him and establish the white man's authority by force. This being interpreted meant that Captain Lindy took some mounted men, a seven-pounder, and a Maxim gun. They surrounded the kraal during the night, and as soon as day dawned a well-directed shot from the seven-pounder gave the signal for the attack to commence. The natives appeared to have fired in reply, but they neither killed nor wounded any of their assailants. The shells of the seven-pounder apparently demoralised the natives, but it did more than demoralise, it killed twenty-one of them, among the dead being the chief, Ngomo himself. Captain Lindy then carried off forty-seven head of cattle and some goats. Deeming the punishment sufficient, he did not fire the huts. Then, departing home, he indited a complacent letter to the magistrate, declaring that a very wholesome lesson had been given to all the chiefs in the neighbourhood. This action met with severe condemnation, both by the late and the present Government. Captain Lindy, however, still retains his position of Commander of the Chartered Company's forces in Mashonaland.

GOOD ADVICE FROM LOBENGULA.

A short time before there had been another trouble among the Mashona tribes. One chief had raided another, and the raided chief refusing to submit, troops were sent against the raider in order to give him a lesson. The affair was reported to Lobengula. He expostulated, writing, "I don't like the action you have taken with the Mashona. What does it matter if the Mashona fight among themselves? it is bad for you to mix yourself up in such matters. You should let the natives settle their own disputes. Small matters like this bring on endless troubles, and cause us both trouble and endless palaver. Dr. Jameson was wrong to mix himself up in this affair." Lobengula took no notice whatever of Captain Lindy's massacre of Ngomo, no doubt feeling the conduct of the British authorities modelled too closely on his own for him to have anything to say.

THE CUTTING OF THE TELEGRAPH.

Then there came up a little trouble about the telegraph wires. Some five hundred yards of telegraph wire was cut and carried off. The thieves belonged to a chief named Goomala, who lived on the frontier line. Instead of giving the culprits up, the chief paid the fine in cattle, and then at once sent word to Lobengula that the English had seized the King's cattle. This seems to have upset Lobengula altogether. Mr. Colenbrander, the interpreter resident, wrote on the 10th of May that the King was "awfully wild" about the seizure of the cattle. Mr. Colenbrander had stated during the previous month that the King was very wild that people should be allowed to come into Matabeleland for trading and otherwise from the east, without first getting his permission. He said what was perfectly true, that worse dangers might arise if white people were allowed to wander about in his districts without his knowledge.

OUR AGENT'S WARNING.

Mr. Colenbrander was evidently impressed with the sincerity of the King. He writes that he is "sure the King is trying to pull straight," and that Dr. Jameson ought to help him all he could. Some traders who had come into the country without the King's permission had been robbed. As soon as Lobengula heard of it, although they had entered his country without his permission, he used all his authority to recover their goods, and succeeded. Mr. Colenbrander concluded his letter by the following significant sentence: "Prevention is better than cure; and in my humble opinion it is better to avoid any open rupture, unless the British South African Company are fully prepared, which I very much doubt." After the seizure of the cattle, Mr. Colenbrander writes, "I have written to Drs. Harris and Jameson to be more careful about the seizures, as these matters may not always be taken so coolly by the King." The King sent a message to these officials, asking them to be more careful, and also asking them the pertinent question whether it was right to punish natives without being positively sure that they were the real offenders.

LOBENGULA'S REMONSTRANCE.

Nothing could be more sensible and dignified than the old King's letter:—

May 13, 1893.

My Friend,—Your people, the people of the Company, have taken from my servant Setause my cattle which he was herding.

The cattle were taken from the young men who were herding them, and who came and reported the matter to the men.

Upon the men going to see and ask why this was done they were told that the telegraph wire had been cut and that my

cattle were taken and would be kept until the people who had cut the wire were found and given up.

My people said they had not cut the wire and knew nothing of it, and asked to be shown the place where it had taken place. Instead of your people doing this they bound and took away some of my men.

I now ask you why you allow your people to do these things.

The King professed to be satisfied with Dr. Harris's explanation, and expressed a hope that the cattle would be returned to his people at Tuli.

WHY THE IMPI WAS SENT.

Out of this incident came all the trouble. Lobengula's conduct seems to have been extremely correct. As soon as he received the complaint that the telegraph wires had been cut and stolen by natives on his side of the frontier, after first protesting against his cattle being stolen to punish the offenders whom he repudiated, he despatched at once a large impi to destroy and punish the thieves. Telegraphing from Bulawayo, Colenbrander warned Captain Lindy not to be scared, as the expedition was not against the whites, but intended to punish the recent wire-cutters as well as some of the Mashonas who had stolen some of his cattle. The impi, however, having received instructions, carried them out with small regard to the more or less imaginary frontier line which had been drawn between Mashonaland and Matabeleland. In the eyes of all the Matabele, Mashonaland is part and parcel of Matabeleland, and if the South African Company is there it is by virtue of a concession by Lobengula, and it in no way prevented the King sending his impi into Mashonaland to punish any of the Mashonas who may have stolen his cattle. This although natural is not a very workable arrangement. The only method by which the two jurisdictions can be worked side by side, is for Lobengula and Dr. Jameson to agree as to a frontier line. Our troops disregarded this in the first instance when they levied a fine upon Goomala's men on the Matabele side of the frontier, and it is not surprising that the Matabele chased the Mashona right into the town of Victoria. The Mashonas as usual were killed like rabbits and their cattle driven off. Some of them, however, took refuge under the British flag.

THE SCARE AT VICTORIA.

The indunas demanded their surrender, which was promptly and energetically refused. Thereupon the Matabele took up a position which menaced the security of Fort Victoria. Then as Dr. Jameson telegraphed, "the Victoria people had the jumps." Volunteers were called out, rifles distributed, and some four hundred men gathered together at Fort Victoria. All business was at a standstill, and every one watched for the threatened attack. They were given notice to disperse within an hour's time. At the expiration of the hour they were still hanging about, whereupon Captain Lindy, with thirty-four mounted men, rode out of Fort Victoria amid a whirlwind of cheers. They dispersed and pursued the impi for nine miles, killing both the indunas and many others. This was a very melancholy response to Lobengula's attempt to punish the cutters of the telegraph wire. Colenbrander repeatedly wrote to say that Lobengula knew it was a serious thing cutting and carrying away the telegraph wire, as it was the white man's mouth. Naturally Lobengula was very indignant at the attack upon the impi despatched to punish the wire-cutters.

LOBENGULA'S PROTESTS.

The following three telegrams set forth his view of the case, with a native eloquence which leaves nothing to be desired:—

20th July.—I shall return no cattle or compensate anybody for either cattle captured by my impi or damage done to property until such time that Rhodes returns to me all the captives, their wives and children, cattle, goats, and sheep which were given protection to by the Victoria people, and had I known at the time when I despatched my impi in the direction of Victoria what I know now, I would have ordered them to capture and loot all they could lay their hands on belonging to the whites, to compensate myself for the people and their property which were withheld from me.

27th July.—My own messengers have arrived, and they tell me that the captured cattle you complain of as belonging to the Company have been duly returned, but you did not tell me that you had a lot of the Amaholi cattle hiding with you, together with their owners; and that when my Indunas claimed them from Captain Lindy, he refused to give up either cattle or men, and told my Induna that the Amaholis and their cattle did not belong to me any longer, and then turned his cannon on to my people. Are the Amaholis then yours, including their cattle; did you then send them to come and steal my cattle? Captain Lindy said you had bought them for money; where then did you place the cash? Who did you give it to? Let my cattle be delivered to my people peacefully. I wish you to let me know at once. I thought you came to dig gold, but it seems that you have come not only to dig the gold but to rob me of my people and country as well; remember that you are like a child playing with edged tools. Tell Captain Lindy he is like some of my own young men; he has no holes in his ears, and cannot or will not hear; he is young, and all he thinks about is a row, but you had better caution him carefully or he will cause trouble, serious trouble, between us.

27th July.—I have received your wire—you accuse me wrongfully. I only sent my impi to recover some of my stolen cattle and to punish the Amaswini that your people complained to me about as constantly cutting your telegraph wires; but it would seem now to me that the white people stole my cattle, for white people know very well that the Amaswini had stolen some of my cattle, for I had written to tell Dr. Jameson; so what have you got to say now? You said before that you would not punish my Amaholi, but now that I send to punish them for you for harm done to your telegraph wires you resent it—my impi on its way back. What goods have my impi stolen and destroyed, and how many cattle have they captured? You only say that my impi has done all this as an excuse for firing on them. I am not aware that a boundary exists between Dr. Jameson and myself; who gave him the boundary lines? Let him come forward and show me the man that pointed out to him these boundaries; I know nothing whatever about them, and you, Mr. Moffat, you know very well that the white people have done this thing on purpose. This is not right—my people only came to punish the Amaholi for stealing my cattle and cutting your wires; do you think I would deliberately go and seize cattle from you? No, that would not be right.

On the same day Colenbrander and Dawson left Bulawayo, the King saying that it would be as well if they were away, as the hearts of his people were sore. So far it is difficult for one at a distance reading these despatches not to feel that Lobengula had the right on his side.

THE BRITISH OPINION ON THE SPOT.

It is, however, well to recognise the opinion of the British at the front, and this has been expressed with no uncertain sound by a public meeting of the inhabitants of Fort Victoria. They held the meeting on the 21st of July, and drew up three resolutions, which are summarised as follows:—

1. Absolute necessity of immediate settlement of the question.
2. Utter want of faith in word of Lobengula, or his power to keep it, with reasons.
3. Result of these yearly raids, paralysing all business.

mining, agricultural, or transport, with evidence of the present condition of affairs, loss of means of subsistence, 4000*l.* per month would have been spent in mining and other salaries, now nil, in farming; loss of stock and burning of crops already experienced on nearly every farm; the natives in the employ of the farmers have been killed by the Matabele, and in many cases cold-blooded murders in their presence; emphatically know that these raids have been, and will be of yearly occurrence during the dry or working season; beyond this, fear of their wives and children being murdered, many Dutch in laager here, with their families, stock, seeds, and farming implements, determined to return unless matter promptly settled; seriousness of interruption to road of entry, post oxen stolen, and boys in charge killed, so that unsafe to travel by transport or post; necessity of accumulating in centres, so leaving property, merchandise, etc., to be looted.

THE SITUATION IN SEPTEMBER.

When Colenbrander left Bulawayo it was equivalent to the departure of an ambassador immediately before the outbreak of war. Lobengula was very furious, or pretended to be so, when the news came of the way in which he had been treated. Colenbrander, who has always been pacific and inclined to rely upon the friendly sentiment of Lobengula, says bluntly in a dispatch received on the 27th of August, that under the circumstances there is no future security for Europeans. Lobengula publicly declared that he would send an impi for the Mashona, their servants and their families who had taken protection under the British flag, and would take them away by force if we refused to surrender them. He abused the impi because they did not retaliate on the English, although he had previously told them to do nothing. He refused to send for the

cattle which had been sent him, and he also refused the monthly payment made to him by the British South African Company. He had thus broken as far as he could with the whites. He had sent messengers at once to bring back the impi that was on its way to attack the Barutzi. When these return it will add 6,000 men to his available forces, or one-third of his total army. Sir Henry Loch, in his estimate of the situation, says that he thinks Lobengula dreads attack, and that he will paralyse industry in Mashonaland by placing a large impi within striking distance of Victoria. Mr. Rhodes reckons that by this time he will have a thousand armed and mounted men at Forts Victoria and Salisbury, and he is not at all likely to allow an impi to remain long within striking distance of Mashonaland.

PEACE OR WAR?

The situation, therefore, is very strained. The British Government has forbidden any aggressive movement; but, of course, if the impi could be induced to take the aggressive, Mr. Rhodes would have a free hand. There is, therefore, reason to hope that Mr. Rhodes, who has made no secret of his belief that all men, even Matabeles, can be squared, may succeed in squaring Lobengula this time. The present crisis is the most severe test through which he has had to pass for some time, and every one must hope that he will emerge from it triumphantly. A victory would be a disaster only second to a defeat. What Mr. Rhodes has to do is to keep the peace and avail himself of Lobengula's friendly disposition, in order to prevent the war party on either side rendering the situation impossible.

From the *South African Echo*.

[September 2, 1893.]

"SQUARING."

LO BEN: "You never met the man you couldn't deal with, eh? Then you will have to gain a little experience from me."

MR. RHODES: "And perhaps we shall have to teach you a thing or two."

LEADING ARTICLES IN THE REVIEWS.

THE POPE AND HIS AMERICAN BISHOPS.

GLIMPSES OF THE "INSIDE TRACK."

THE exceptional career of the Rev. Dr. Edward McGlynn gives significance to the disclosures he makes in the *September Forum*. A priest of New York, his native city, he supported Henry George when that land-nationaliser stood for the mayoralty; and for the position he took on the land question was censured and deposed from the pastorate by Archbishop Corrigan. He was afterwards excommunicated for refusing to appear at the Vatican, but the ban was removed by Mgr. Satolli (the Papal Delegate in the United States), on the Pope's authority. He writes professedly and manifestly as one "behind the scenes." He presents a picture of internal discord and intrigue which contrasts strangely with the outside view of the Roman Church.

Dr. McGlynn ridicules the idea that Catholics accept as if they were something divine the mere policies and politics of priests, bishops, or popes. The actual fact is, vast numbers of Catholics tolerate, while deploring, what they feel to be the blunders or worse than blunders of the human element in the Church, because they desire to enjoy in peace the graces and blessings of the divine element. . . But even among Roman Catholics toleration and endurance have their limits. . . Even the clergy have not been slow to complain of the arbitrary and despotic rule of bishops, in the election of whom, both clergy and laity, whose business it is to be led and led and sometimes fleeced, have had no voice.

HOW BISHOPS ARE CHOSEN.

Such remarks as these show the working of that democratic leaven which many observers have noted in American Romanism. More serious objections follow:—

As a matter of fact, bishops have been made whose chief, if not only qualification, was that they were good financiers. . . In the earliest days of the Church in this country the system was adopted of having the Pope appoint bishops upon the recommendation of other bishops, and without the slightest reference to the wishes of the clergy or the people. . . Witness the recent well-known fact of the appointment as Bishop of Brooklyn of the private secretary of the Archbishop of New York in utter disregard of and in opposition to the wishes of clergy and people.

BISHOPS TRYING TO THWART THE POPE.

Under this system the bishops of the United States, while professing boundless devotion and loyalty to the Pope who appointed them, but who fortunately for them is four thousand miles away, have had practically a free hand to govern despotically both clergy and people, and to lay upon them what burdens they pleased, and to refuse them justice and even a hearing. Until very recently the government of the bishops in the United States was practically arbitrary, with no other remedy than an appeal or recourse to Rome. . .

Some years ago the Holy See, tired of complaints, and distressed at its own inability to take proper cognisance of cases from this country and to do prompt and substantial justice, ordered the establishment of some judicial forms through the appointment by the bishop of a committee of priests in each diocese, to be called "*judices causarum*," for judges of cases.

But these benevolent intentions the American bishops did their best to frustrate.

Again, while the appointment of bishops is made by the Holy See, such appointment is almost invariably the result of the recommendations of a sort of close corporation of bishops of the province who in great secrecy make up and send to Rome

a list of three names, the first and second of which are likely enough to be the names of mere favourites or private secretaries whom it is desired to reward for their adulation and personal services—sometimes, if the whole truth be told, of servants of whom their masters have tired and of whom they desire to get rid.

HIS HOLINESS "DISTURBED AND VEXED."

His Holiness has been "disturbed and vexed" by the action of the American bishops in sending Catholic children to inferior schools "under the plea of religion," and striving "to perpetuate in our country through churches and church schools foreign nationalities," action which Dr. McGlynn describes as "constructive treason against the unity of our American nationality." At last, therefore, "in spite of the expressed unwillingness of nearly all the archbishops of the country to approve of his avowed intention, the Pope . . . has established here a permanent Apostolic Delegation." Its first occupant is Archbishop Francisco Satolli.

CONSPIRACY, INTRIGUE, AND MISREPRESENTATION.

Bishops and archbishops . . . have scarcely taken the trouble to conceal their hostility to the new order of things, and a bitterness hardly distinguishable from downright malignity has been manifested by some of them whose unrighteous judgments he has promptly reversed. . . It is a sort of open secret here and in Rome that they have entered into a conspiracy to drive this man out of the country by intrigue and misrepresentation: and one of their favourite measures, the one with which the public is naturally best acquainted, is the publication of fabricated dispatches and communications purporting to come from Rome, and elsewhere, but actually coming from the hands of some of the chief conspirators themselves. These men, who were accepted as bishops and archbishops by a docile Catholic people to whom they were strangers, have had the hardihood to conspire against the Holy See and its delegate under the pretence of standing up for Home Rule, and have permitted their foolish friends to sneer at the Holy See which appointed them, as something foreign. The Holy Father is not uninformed of their purposes and arts, and is immovable in his determination to thwart them.

INTERVIEW WITH THE POPE. "ALL MIND AND SOUL."

At noon . . . I was admitted promptly to the presence of the Holy Father, and was alone with him about twenty-five minutes . . . I had never seen Leo XIII. before. I was not overawed by his majesty, which is great, but was rather won by his evident desire to show me truly paternal kindness. I remained kneeling during the interview close to him, and leaning with my hands on his chair. I was impressed with his dominant intellectuality, which seems to be accompanied with equal vigour of will, although he is very thin and white, his face being nearly as white as his hair and his cassock. I thought him all mind and soul, in a body that one might almost call transparent.

His Holiness did not apparently take Dr. McGlynn to task for his support of Henry George:—

He contented himself with a reference to those new questions by saying, "But surely you admit the right of property?" to which I answered, "Why, of course I do, and we would make absolutely sacred the right of property in the products of individual industry."

"THE POPE'S EYES FLASHED."

The Pope led me immediately into a conversation about Mgr. Satolli and the Apostolic delegation. Intrigues, the Pope assured me with great earnestness and solemnity, could not affect him. "Whatever may be said concerning intrigues," he said, "I, the Head of the Church, am above all such intrigues, and am utterly uninfluenced by them." When I referred to the opposition of certain archbishops from the

very beginning to the institution of the apostolic delegation itself, the Holy Father said to me, "Yes, but now they see it in a different light and have written to that effect!" To which I replied, "Because they cannot help themselves. These bishops cannot rebel against the Pope. The people, as a rule, are not much concerned for or devoted to the persons of their respective bishops, who have not been elected by the clergy of the people, but have been placed over them by the Pope; and the same Pope who places them there can take them away and put others in their places who will be equally well received." The Pope rejoined with increasing emphasis, "Have not I, the Head of the Church, the same right to have my representative in America as in Madrid, Paris, or Vienna?" I said to the Pope that now the bishops are compelled to have a delegate in America they want to make a scapegoat of Satolli because of his uprightness and fearlessness, and to have somebody else in his place whom they can more readily manage or capture. At this the Pope's eyes flashed, and, striking the arm of his chair, he said, with increasing emphasis, "Satolli! I know Satolli. It was I who brought him up; and so long as he does his duty and obeys my instructions, I will support him."

Dr. McGlynn concludes with an expression of joy that the aged Pontiff "seems to grow in breadth and vigour as he ages," and of "bitter regret that any of those who hold high office by His favour" "should add to his cares and burdens by their petty intrigues."

They may take my word for it that there was a resonance in his voice and a flash in his eye in parts of his conversation with me that made it perfectly clear that they cannot oppose his wishes except at the greatest peril to themselves.

These remarkable disclosures, taken along with the Pope's letter on the public school question, seem to show that in America as well as in France His Holiness is a better Liberal than his bishops.

ANOTHER VIEW OF SATOLLI'S MISSION.

In *Our Day* for September the Rev. Jos. Cook endeavours to throw light from another source on the legation of Mgr. Satolli:—

As long ago as last October, as I was riding on the shores of the Hudson, one of the greatest experts in this country on the school question said to me that he happened to know that the Chairman of the National Committee, managing one of our great parties—I am not at liberty to say which one—had sent an elaborate protest to the Romish Propaganda against the attack now in progress on American common schools, and that a most distinct threat had been made in the name of that committee that a plank defending the schools would be put into the party platform, no matter what the Catholic authorities might say, unless the attack should speedily moderate its severity and audacity. And it has done so promptly. Very soon after that warning was sent to the Vatican from this country, Satolli was sent here. It is well understood that he is the response of the Papal authorities to the expostulations they have received from Roman Catholic American observers of the signs of the times. . . . He is not here to repeal the Papal programme; but to conciliate its opponents.

Dr. Cook is glad that "Satolli is on the coach-box," and has sided with Archbishop Ireland against Cahensley on the question of the Public Schools. But the Boston lecturer thinks that "Clericalism is now more dangerous in this country than ever, because it is at once more powerful and more masked."

"The five hundred and eighty thousand persons buried every year in England and Wales, at a rough calculation, become twenty-six thousand two hundred and fifty tons of putrefiable matter." Can this continue without grave danger? These words of Sir Spencer Wells in the *Humanitarian* put the case for cremation in a nutshell.

A REAL "ISLE OF THE BLEST."

"An Arcadian Island" with a population of "about four hundred simple Christians" is pleasantly described by Adelia Gates in the *Leisure Hour*:—

This isle of the blest is one of the Lipari group, lying to the south of Italy, and between it and Sicily; and it is known to the world as Panaria. Within its borders there is neither doctor nor dentist; yet its inhabitants live to a good old age, and keep their teeth well. There is no lawyer, and no prison; yet there are no disputes over boundary lines, no quarrels between debtor and creditor, and no theft. There is no liquor-seller, nor tobacconist, nor tea-merchant; and yet the people are not unsocial nor gloomy. There is no almshouse, and no beggar. . . . Each family wins from its own plot of ground enough grain, vegetables, oil and wine for home consumption, and of the two latter products sufficient is exported to procure from abroad the materials for their simple clothing, which the housewife makes up in complete independence of tailors. The sea yields them all their animal food, except perhaps a few chickens for great occasions, as a christening or a wedding. In the whole island there is no carriage-road, and few there have ever seen a horse.

This idyllic state of affairs is largely due to the work of a single priest, a sort of Catholic Oberlin, a personal epitome of the Civic Church:—

When he came to Panaria he found no port, no post, no school, no church, no anything but a verdant and fertile island, and a people, not savage nor bad, but utterly illiterate—*indifabeti*, as the Italians say. He has remained there unto this day, devoting himself to their welfare as faithfully as Father Damien to his lepers, baptising, marrying, burying, preaching, teaching, and growing old serenely in his consecrated service. Thanks to his untiring efforts Panaria has now a little port, postal communication with the mainland, a submarine telegraph to Sicily, a school, and a commodious church, where, three hundred and sixty-five mornings of the year, and fifty-two afternoons, there is a service.

All the public offices are united in one person. . . . Padre Michelangelo is . . . priest, mayor, harbour-master, postmaster, and master of the marine telegraph, aided in the last-named office, however, by his widowed niece.

If you would give alms at Panaria, there is no one to receive them.

The Catholic Women's League.

THE *Catholic World* for August publishes an account of an attempt to establish a Catholic counterpart to the W.C.T.U. The editor says:—

The Catholic Women's Congress held in Chicago, May 18th, gave an outline sketch of the work of Catholic women, beginning with a paper on "The Elevation of Womanhood through the Veneration of the Blessed Virgin," and closing with the life-work of Margaret Haughery, of New Orleans, the only woman in America to whom the public have raised a statue. The enthusiasm awakened by this congress drew a large body of Catholic women together, who organised a National League for work on the lines of education, philanthropy, and "the home and its needs"—education to promote the spread of Catholic truth and reading circles, etc.; philanthropy to include temperance, the formation of day nurseries and free kindergartens, protective and employment agencies for women, and clubs and homes for working-girls; the "home and its needs" to comprehend the solution of the domestic service question, as well as plans to unite the interests and tastes of the different members of the family. Each active member of the league registers under some one branch of work according to her special attraction.

He then publishes articles by Catholic women, which from their indifference to women's suffrage seem to show that there is indeed a great need for missionary work in their midst.

COUNT TOLSTOI ON M. ZOLA'S GOSPEL.

THE September number of the *Severnoi Vestnik* publishes an article by Count L. Tolstoi on M. Zola's recent speech to the French youths and to A. Dumas' letter on the same subject, to which M. Zola makes reference in his speech. Whilst blaming the tendency of the French youths towards mysticism, M. Zola in his speech recommends them to put their faith in contemporary science and labour. Count Tolstoi replies to the French novelists in the following words:—

THE INDEFINITENESS OF SCIENCE.

M. Zola disapproves of the fact that the modern teachers of the young teach them to believe in something indeterminate and vague, and in this he is quite right; but unfortunately he on his part only proposes them a faith in something more vague and indefinite, namely, a belief in science and labour. M. Zola considers the question of a faith in which one must not cease to believe as quite settled, and subject to no doubt whatever. Labour in the name of science! But the fact of the matter is that the word "science" has a very wide and very indefinite meaning, so that what some people consider a very important matter of science, is considered by others and by the majority—by all the working classes—as wanton stupidity; and one cannot say that this arises from the absence of education of the working classes unable to understand the profundity of thought of science, for the men of science themselves reject one another. Some consider philosophy, theology, jurisprudence, political economy, to be the supreme science; others—the naturalists—consider all this most empty and unlearned stuff; while, on the contrary, that what the positivists regard as the most important science, is considered by spiritualists, philosophers, and theologians to be, if not a pernicious, at all events a useless occupation. However, this is not enough. In one and the same province, among its very priests, each system has its equally competent and warm partisans and adversaries, who affirm diametrically opposed ideas. This is not all; in every province of learning there constantly arise scientific situations, which after existing one, and sometimes more than ten years, are suddenly found to be erroneous, and are hastily forgotten by the very people who propagated them.

ITS CONTRADICTIONS.

We all know that that which the Romans exclusively regarded as science, and considered most important, that upon which they prided themselves, and without which a man was looked upon as a barbarian was rhetoric, that is an occupation which we laugh at now, and consider to be not even not a science, but nonsense. We likewise know that in the middle ages scholastic divinity was considered a very important science, while now it is also a thing we laugh at. And I think no great audacity of thought is required to foresee that among the great mass of knowledge which in our times is considered important, and is called science, there is much that our descendants will shrug their shoulders at, as for instance when they read of the seriousness with which we regard rhetorical and scholastic divinity.

As regards belief in labour, Count Tolstoi speaks as follows:—

THE VIRTUE OF LABOUR A FALLACY.

I have always been surprised, he says, at the extraordinary opinion, established principally in the west of Europe, that labour is something like virtue, and long ago, before reading this opinion clearly expressed in M. Zola's speech, have I been surprised at this strange importance ascribed to labour.

Only the ant of the fable, as a being devoid of reasoning and aspirations to good, could think that labour is a virtue, and could pride itself upon it. M. Zola says that labour makes a man kind. I have, however, always noticed the contrary. Self-conscious labour, the ant's pride of its own labour, makes not only an ant, but even a man, hard. The greatest villains of mankind were always particularly occupied and busy, and did not permit themselves to be one moment without employment or amusement. But even if laboriousness

is not a distinct defect, still it cannot ever be a virtue. Just as little as nutrition is a virtue can labour be one. Labour is a necessity, the privation of which makes one suffer, but in no wise is it a virtue. The elevation of labour to a merit is the same monstrosity as the elevation of a man's nutrition to a merit or virtue would be. The signification attributed in our society to labour could only arise as a reaction against idleness, elevated to a sign of nobleness, and till now considered a sign of merit in the rich and uneducated classes. Labour, the exercise of one's faculties, is always indispensable to man, as is proved by calves bounding round the stake to which they are tied, and by people of the rich classes, martyrs, occupying themselves with games: cards, chess, lawn-tennis, etc., unable to find a wiser exercise for their faculties.

Labour is not only not a virtue, but in our falsely organised society it is mostly an anæsthetic remedy, like smoking or wine, to hide from oneself the irregularity and depravity of our life. "When am I to discuss philosophy, morality, and religion with you? I must publish a paper having half a million subscribers, I must build the Eiffel Tower, organise the Chicago Exhibition, dig the Panama Canal, finish writing the twenty-eighth volume of my works, my opera, finish painting my picture."

THE SOLACE OF EMPTY AND PERNICIOUS LABOUR.

If people of our time had not the continual excuse of labour by which they are all absorbed, they could not live as they do now. It is only thanks to the fact that they conceal from themselves the contradictions in which they live by means of empty and often pernicious labour that they can live as they are living—and it is especially in the quality of such a remedy that M. Zola represents labour to his auditors. He says plainly: "This is only an empirical remedy to lead an honest and almost peaceful life. But is this not sufficient, is it not enough to acquire good physical and moral health, and avoid the danger of chimeras, by solving through labour the question of the happiness most accessible to man?"

Count Tolstoi is of quite a different opinion about Dumas' letter. He expresses his entire sympathy with Dumas' thoughts, and calls him a prophet.

MR. CHAMBERLAIN DISSECTED.

In his *vade mecum* for Cabinet Ministers, which appears in the *Nineteenth Century*, and is noticed on another page, Mr. Auberon Herbert venturing "to treat Mr. Chamberlain's soul as public property," thus describes it:—

Never was soul which had more earthly wrappings to it. Never was soul so beset with carnality. Two Western men once discussed the efficacy of the water employed in baptism, and thereupon one of them delivered it as his opinion that if it were to be of any avail in the case of a particular friend who was under discussion, that it would be necessary for that friend to be anchored out for at least twenty-four hours in mid-stream. Mr. Chamberlain's spiritual necessities are of the same order as the spiritual necessities of that friend of the Western man. His soul requires to be hung out for at least a week on the highest mountain peak, or plunged into the sea beyond the three miles' limit, in order to get rid of its earthy admixtures. Mr. Chamberlain's politics, beyond the ordinary measure in politics, even when pressed down and running over, are saturated with commercialism. His constant recurring idea is the exhibition of political wars. Such and such things are the peculiar achievement of his own horde, and are not to be claimed by the other horde. Such and such things are good to be done, just because they will help the reputation of the horde. But still for all that, the soul exists and persists, and as long as that is so all things are possible. Unless I read him wrongly—and it is very difficult to read in that blurred, stained human palimpsest—there is a vein of conviction mixed in with the commercial opinions, there is a bottom to be reached, there is definite resistance, and therefore there is personality. You may have to wade through layers of carnality, layers of commercialism, but at the end you do arrive.

THE CABINET MINISTER'S VADE MECUM.

BY HON. AUBERON HERBERT.

ONE of the richest pieces of political satire, as well as one of the most delightfully and provokingly impartial, is contributed to the *Nineteenth Century* by Mr. Auberon Herbert, under the title of "A Cabinet Minister's Vade-Mecum." What he calls the "thirteen commandments of the new dispensation" are thus enumerated:—

If you wish to pass a great measure that profoundly alters, for good or for evil, the relations of the parts of a great country, first make yourself master of the following necessities:

1. Keep the measure carefully veiled—something after the fashion of a presentation picture or a bust of the Mayor subscribed for by the Corporation—so as to make it impossible, until the actual fight begins, for the nation to understand it, criticise it, test it, detect weak places, or pass an intelligent judgment upon it. This, perhaps, may be expressed in other words: whenever convenient from a strategical point of view, put a hood over the eyes of the nation, treat them as a negligible quantity, and don't for a moment indulge their fancy that they take any real part in passing great measures. That work is exclusively the private business of the professional fighters.

2. When there is a specially difficult and complicated point, (a) call upon either the newspapers, or the House, or your own party in the House, to be good enough to settle the matter for you; (b) leave it for your successor—whichever he may be—to deal with; (c) use such language in your measure that nobody can exactly say what is meant or not meant.

3. Be ready to alter vital arrangements at twenty-four hours' notice, and to expect all those concerned to alter their profound convictions in the same number of hours. It will be found of the highest importance in modern politics to practise the manœuvre of revolution on your own mental axis, so that, whenever necessary, the dogma of yesterday may by instantaneous process be expelled in favour of the dogma of to-day. Celerity of movement in this manœuvre is of the highest importance, as it is not desirable that the public should realise what is taking place.

4. In order to facilitate No. 3, aim at bringing the discipline of the party to such a high point that they take their official exercise in the official lobby without experiencing any inconvenient desires to exercise other functions except the crural muscles. No Member of Parliament can be of real service to his party if these special muscles are not in good order. Grouse shooting is recommended in the recess by way of useful training.

5. Always assume official infallibility, and therefore—except when it may be necessary to avoid a catastrophe as regards the division list—disregard all views of your opponents, and all those varied lights which are thrown from different minds, when a subject is frankly and widely discussed apart from political partisanship by an intelligent public.

6. Be prepared to assert that days and hours are of infinite importance in the life of a nation; that, if discussion is not brought to an end, Ministers will refuse to be responsible for the continued existence of the nation; and therefore it is far safer for the nation to exist in ill-arranged fragments than to make rash attempts—at the expense of days and hours—to give order and coherence to the parts.

7. If you are aware that some special portions of your work are of defective workmanship, strict silence on the part of your own followers, and free use of the closure on the plea of saving time, are the orthodox and approved as well as the most simple methods of treatment.

8. It is no use being squeamish in such matters, and if you establish a machinery for stopping discussion, you may as well employ it to prevent voting as well as speaking on amendments.

9. To put it quite plainly, use any kind of gag or guillotine that is most efficient. A political opponent is but a kind of vermin to be got rid of on easiest terms, and the parliamentary machine must be constructed so as to deal effectually with vermin at short notice. A majority has to govern, and there's the end of it.

10. When you are engaged in passing what is perhaps the biggest measure of the century, you must be careful not to let the nation judge it frankly on its own merits. It must be sugared by putting by its side certain dainty morsels that you consider toothsome for various important sections. The way to pass those great measures on which your party depends is to put the sections in good humour, and to let them understand that their own bit of cake depends upon the big loaf being eaten. Sugaring the sections is the secret of success in modern politics.

11. When you hold in trust the interests of two nations, you must boldly sell the interests of the one nation at any point where by selling them you thus command the support of the other nation for yourself. In such cases look upon nations but as sections in a nation, and treat in same manner. A clear head and boldness in buying and selling will indicate the best method to be followed.

12. If there is a weak class possessed of property whose influence and support count for little or nothing, they can be usefully treated as vote-material for strengthening your position as regards other more valuable classes of supporters.

13. If by any chance you have given pledges or expressed opinions, or have been betrayed into denunciations which conflict with the course which you are now taking, you must explain that truth in political matters must not be confused with truth in other everyday matters; that in politics it is strictly relative; that a thing which is true from the Opposition benches is not necessarily true from the Government benches; that a truth employed to pass a measure at a particular time ceases to be a truth after the measure is passed; and that it is mere moral pedantry to suppose that political truths have an objective reality, as they clearly depend upon the condition of mind at any given moment of certain classes of voters, especially those classes which happen to hold the balance of power in their hands. Political principles are of the highest importance and utility, so long as they are confined to their one proper purpose, as rhetorical decorations. They are of great value during a debate, to which they give considerable force and dignity, but should not receive attention after the close of debate.

Mr. Herbert winds up this reel of rules by declaring—

Commandments of the new dispensation will, I think, quarrel much with them. They are in the nature of truisms and platitudes nowadays on the lips of us all. Mr. Balfour and Mr. Chamberlain will tell you that these are the principles on which the Liberals manage their business. Mr. Gladstone and Sir W. Harcourt will tell you that they exactly express the conduct of the Conservatives when in office.

A new definition of the State as we know it appears in this article: it is the Voting Crowd. This is not the only phrase given here which is likely to become famous.

THE *Lyceum*, I am informed, is no longer the "organ of the Jesuits." It has for some years ceased to be written or controlled by the Jesuits. The editor writes: "I have the greatest respect for the Order of the Jesuits, but I have not the honour to belong to it, nor is the *Lyceum* in any way under its influence or its guidance."

A QUESTION FOR CANADA.—"Three Years Under the Canadian Flag as a Cavalry Soldier" is a book written by James Slater, who brings such serious charges against British officers and officials of the Dominion that he ought to be either prosecuted for libel or publicly vindicated. It is a scandal that such charges should be made with such persistence, and particularity of detail, without any attempt either to rebut the libels or to punish the libeller. The accusations of fraud are so precise that it is difficult to believe there can be any but one explanation as to why no action is taken. But if that explanation be accepted, what are we to think of the honour of Canadian public men?

CIVILISATION ON THE BRINK OF RUIN!

MR. FREDERIC GREENWOOD AS JEREMIAH.

I SAY "Jeremiah" advisedly—not Cassandra; for however dark his catalogue of woes, the Hebrew prophet mostly marked out a way of escape. So Mr. Greenwood, in *Macmillan's*, after drawing harrowing pictures of "The Great War"—which is expected to devastate Europe—"or, Civilisation its own Executioner," gives us a hint how even yet the doom may be averted. He begins by recalling the "universal apprehension" of the imminence of a war which, when it does come, will "whelm all Europe." This common belief is "itself a portent."

ARMAGEDDON—AND AFTER!

"The sudden and extraordinary development" of science, which supplies "ever new and ever more terrible engines of destruction," has by no means reached finality; yet—

As it is, a nation may be at peace this week, complacently viewing a sky without a cloud on the horizon, and three months hence be a burning waste; 'tough not, perhaps, till the victor has spent money in tens of millions and lives in scores of thousands.

And after "a war meant on all hands to be determinate," "the example of forcing an enormous indemnity" which Germany set in 1871

will be bettered to the full extent of draining the conquered country dry . . . It is evident that a well-calculated scheme of indemnity is not only capable of draining off through decent and business-like channels the utmost amount of spoil, but of becoming a good substitute for the ancient but now impracticable custom of enslavement . . . The great war of universal prophecy will be waged by groups of nations, so that groups of nations may be crushed almost irretrievably . . . Other civilisations . . . mostly perished by fire and sword; and though many pretty things may be said of our own civilisation, nothing can be said with greater truth than that it seems to be taking the utmost pains to provide its own destruction in that way precisely.

THE SIGNAL TO BEGIN.

The dread of risking so terrible a catastrophe might preserve peace for a time—until "any one of two or three Powers that could be named found itself the sole possessor of some precious gift of science in the shape of a singularly swift and deadly engine of war;" or "when one of the two alliances has forged its last gun with its last available shilling," when its "accumulation of armaments" can go no further.

Another difficulty threatens in the competition for trade between the nations, spurred on by the new discontent of the masses:—

It is not unlikely that a general sense of all this deepens the fear that the Great War, when it comes, will be sweepingly disastrous; first fire and sword, and then, perhaps, the Red Spectre, of which it is possible to regard the Commune in Paris, when France lay in agony under the Prussian boot, as a sort of prophecy.

RUSSIA AS AVERTER OF ARMAGEDDON.

Mr. Greenwood now turns to the bright side. He assures us, "The inevitability of the Great War is less clear to me than to most." The first ground of this confidence is supplied—strangely enough—by the growing ascendancy of Russia!

Partly from geographical extent and conditions, partly from a certain capability of self-support, partly from the very barbarism or half-barbarism of the country, the risks of the dreaded war are nothing like so great for Russia as for the other European Powers. It is this that gives her so commanding a position, and one that she is likely to retain and improve upon.

The present strain of preparation seems likely to wear out Italy first and then the German Powers. This will be Russia's opportunity. "By careful management, continuance of the waiting game, long maintenance of an attitude of sullen hostility with occasional 'movements on the frontier,' Russia may bring" the Alliance to choose between the enormous perils of a precautionary war and common action against a non-Continental foe.

A general European war is not more readily conceivable than a new Continental compact which shall put off the war, or reduce it to dimensions which imagination need not start at, by making common spoil of the outlying possessions of England. Coalitions with this view have actually been proposed within a very recent period, and only abandoned through the occurrence of accidental circumstances.

This is cold comfort, truly; but it is happily not the whole of Mr. Greenwood's gospel.

HOW BRITAIN MAY SAVE CIVILISATION.

It is not as if Britain could choose no policy divergent of the course of events. I cannot but think that if the rulers of this country were truly wise and patriotic, the chiefs of parties would meet on the purely neutral ground of national defence to settle what course of action should be prepared for Great Britain in either event; that is to say, in case the Continental Powers should drift more rapidly into the long-dreaded war, or in case the ascendancy of Russia should menace England with a coalition to stave off the war. Two things accomplished . . . and the whole aspect of affairs would change immediately. One is to remove the conviction that England's friendship has become worthless to all intents and purposes (the tale which is now being told in Siam), and the other to shatter the belief that her fighting days are over. That done, the Great War would be postponed indefinitely; for England herself would be, or could be, at the head of a coalition dictatorial of peace, and a peace in which, of course, her own dominion would remain secure.

Mr. Greenwood does not indicate how these two ends are to be obtained. Nor does he specify the other parties to the proposed coalition. He could not of course conclude without lamenting "our present political condition." If that is to be permanent, he confesses to despair both of the British Empire and the civilisation of which that Empire is the chief "prop and stay." If it be, as he believes, only "accidental and reparable"—

the people of this island still have it in their hands to rescue their splendid Empire from premature destruction, and at the same time to put Armageddon far out of the prospect.

A Plea for "District Parliaments."

AND in *Blackwood*, too, of all places in the world! "The Decadence of Parliament" sits heavy on its soul:—

The revival of the House of Lords may be regarded by patriotic men of all parties with a feeling of genuine satisfaction, because it is a revival not resting on the prejudices of an oligarchy, but on the perception of the ablest and most independent men in the country of their duty as the leaders of a patriot democracy.

But the House of Commons is in a dismal plight, largely owing to the plethora of carpet-baggers under the thumb of the caucus, and to the youth of its Members. The remedies propounded are, "get good local candidates;" "give them a freer hand;" and—in effect—multiply Home Rule!

It is hardly likely at the present moment that our rulers would consider with favour a proposal for a reduction in their own numbers. But if the time comes when District Parliaments are established for the consideration of such matters as are now dealt with by private bills, the country might with advantage remit the consideration of the great issues of State policy to a moiety of the gentlemen who now sit in the popular chamber.

"SET THE POOR ON WORK."**THE UNEMPLOYED IN THE PAST.**

THESE words are quoted from the famous Elizabethan Act which required the authorities of the parish "to take order for setting to work the children" of poor parents, and also "all persons having no means to maintain them," as well as to raise the necessary stock for these purposes "by taxation of every inhabitant."

In a most valuable and timely article in the *Nineteenth Century*, Professor Mavor gives a history in outline of the efforts made in this country to realise the ideal so set forth. After suggesting several reasons for the slight use made of the Act mentioned above—its lack of explicitness as to methods and extent of application—Professor Mavor gives a list of the more notable schemes mooted for the employment of the poor, from Sir Matthew Hale's to Robert Owen's.

THE HOUSE OF INDUSTRY.

Proceeding to recount the actual efforts made by parochial bodies, he tells us:—

In the third quarter of last century a definite movement in the direction of founding Houses of Industry extended, especially over the south of England. . . . [They] were, as a rule, founded by a number of parishes incorporated for the purpose. Whole families were admitted, able-bodied and impotent poor alike.

THE PARISH FARM.

In addition to the Houses of Industry there were established from about 1777 onward, a number of Parish Farms. These were ordinary farms which had become vacant and were taken by the parish, and by trustees acting on behalf of the parish, for the purpose of setting the poor to work.

Where failures have occurred, and most of the farms resulted in failures, they may as a rule be traced to want of proper management rather than to any inherent defect in the system.

At Cranbrook, in Kent, the overseers, in 1730, took a farm under trustees, and worked it by the paupers until 1834. The parish being then no longer legally authorised to continue the Parish Farm, the trustees kept it going at their own risk until they were turned out by a new landlord in 1853.

The farm during that period of voluntary management accumulated a considerable amount of money. Donations were given by the trustees to the parish of Cranbrook, and even to extra-parochial objects. "When they went out many circumstances occurred to their advantage," and thus they found themselves in possession of a fund of £1,000. With this money they built a new vestry hall, paid off vestry debts, and handed over the balance for investment for behoof of the parish.

"TOO MUCH TROUBLE."

Why, then, were the Parish Farm and House of Industry not more extensively adopted? Simply because it cost too much trouble. The Poor Law Commissioners of 1834 assigned these reasons:—

1. To afford relief gratuitously is less troublesome to the parochial authorities than to require work in return for it.

2. The collection of paupers in gangs had an injurious effect upon some of them.

3. Parish employment affords no direct profit to any individual. Under most other systems of relief the immediate employers of labour can throw on the parish a part of the wages of their labourers.

"The indolence of the parochial authorities" allowed the Houses of Industry to become mere almshouses, where the young were "trained in idleness, ignorance, and vice."

While the House of Industry was thus not highly developed, almost all the overseers in England organised some simple work with the view mainly of preventing paupers from being quite idle. As a rule the workhouse-masters found it difficult to get work for the paupers to do. Needlework for the slops was done in the workhouse, and work was done in it for various tradesmen.

The new Poor Law of 1834 practically abolished the system of "setting the poor on work," excepting as a test prior to relief.

From this historical survey Professor Mavor does not derive any optimistic conclusion as to the success of modern attempt in a like direction.

The history of the parish farm shows that while it is costly and highly susceptible to the evils of bad management, it may be adapted to the needs of the beggar; but there is no evidence to show that the respectable artisan would be likely ever to enter it so long as the beggar is there.

THE UNEMPLOYED IN THE PRESENT.

MR. ARNOLD WHITE writes suggestively and caustically in the *Fortnightly Review* on the question of the unemployed. The one feature which will mark out this age from others that have preceded it is, he surmises, "the universal love and worship of comfort. To be comfortable is the dominant religion of the masses and the classes." This renders the problem more acute.

Bad harvests, cholera, the appreciation of gold, the uncertainty of trade, foreign immigration, the European outlook, Irish supremacy, dear milk, the degradation of the House of Commons, improvident marriages, and Mr. McKinley, combine to render the outlook for the coming winter—more especially if the cold be severe—a sombre and menacing prospect.

Hungry Londoners do not envy the rich their luxuries. "The abiding envy of the rich man by the poor is the certainty of food." Mr. White is not too sure of social stability. "When a hungry body contains an educated mind the result is revolution." His specific of emigration is once more to the fore. Mr. Rhodes, in return for the mother country crumpling up the Matabele, might give so much irrigated land at the Cape for our unemployed.

LARGE SCHEMES.

We might even buy tracts of land in a South American Republic, police it, and Anglicise the whole community. . . . A million of money sinks to the bottom in the shape of a single vessel. The nation does not feel the loss. A million spent on the unemployed at home and abroad could not all be sunk, and would, under skilled management, perceptibly increase the area of demand for British manufactures. . . . There are desperate men amongst them to whom no change can be for the worse. For such people the offer of a task of labour on earthworks, such as for two generations has been freely given to the Hindoo in famine times, is the least that can be expected.

A CIVIC CENTRE FOR CHARITIES.

What society can do for the unemployed then is to emigrate the four per cent. of the fit among them; stop the immigration of "chronic incurable paupers" from abroad; take the children out of what S. G. O. used to term the "guilt gardens"; give relief works to the adults; restrict charities exclusively to the sick, aged, and very young; encourage the growth of trade unionism; discourage improvident marriage, and entreat the Church to enjoin common sense as regards this subject upon her priests and deacons; and finally, remember that the work done by present charities could be done for one-third less cost by adopting a simple system of co-operation between agencies of character and standing existing within each parliamentary borough, and arranging for all gifts to that area being passed through one channel, and distributed among the agencies on a preconceived system, made to avoid overlapping.

PESSIMISM AS A RELIGION.

A FIN DE SIÈCLE ECCLESIASTES.

DR. C. H. PEARSON, whose recent work on *National Life and Character* had established his reputation for broad and philosophical if somewhat sombre views of modern tendencies, occupies the opening page of the *Fortnightly* with an investigation into the causes of pessimism.

There is said to be a strain of pessimism noticeable in the writings of the last few years. Sometimes it takes the form of despondency as to the future of humanity at large or of a particular people. Sometimes it rather seems to indicate perplexity over some great moral problem. Now and again it is a regret over some system or faith that has disappeared, and which, it would seem, cannot be replaced.

The writers adduced in support of this opening statement are Mr. Greg, M. Rehan, Matthew Arnold, M. Paradol, and the poet Clough. Carlyle's pessimism may be explained by his early surroundings and constitutional ailments: "Calvinism trains strong men, but can hardly be said to predispose to cheerfulness." Yet Shelley's ill-health, home-troubles, disgust with existing society, did not repress his buoyant and hopeful temperament. "We must look beyond the individual."

After alluding to the social forecasts of Mr. Morris, Mr. Bellamy, and M. Tschernischeffski, Dr. Pearson says—

it is only natural that the framers of these ideals and their disciples should be among the most energetic and the most sanguine of men. They have made their heaven such as they would wish it to be, and they believe it to be so nearly within reach that it only remains for them to order their ascension robes.

THE SOCIAL PARADISE A PERSONAL INFERNO.

There are many, however, whom the prospect will impress very differently. To these it will seem that the best part of the Socialistic programme—the elimination of crime and poverty from the world—is never likely to be adequately carried out. . . While, however, the great gains are problematical, certain great losses are inevitable. The new society, with its admirable bureaucracy, comprehending really all ranks, with its industrial drill, with its houses designed by a State architect, and built more or less with monotonous uniformity, with its dreary round of amusements and unvarying civic costumes, will be the very apotheosis of luxurious common-place. Everything that has made the old world—parliamentary life, military service, public meetings to urge some great change, travel, and commercial adventure is to be eliminated. . . In our world the man can at least take his own line in life, and educate himself by contact with the best of his fellow-men, or give himself up to thought and study in isolation. In the new world he is to be passed through the same educational mill as his fellows till he is twenty-one, and then to serve in the industrial army either for life, or, by Mr. Bellamy's more ingenious programme, till he is forty-five. Then, shaped as he is by civic influences, he is to be set free to cultivate what individuality may be left to him. Is it wonderful if men who regard our best in the present day as sadly imperfect are appalled at the prospect of such a Paradise as we are offered?

THE FATALISM OF HEREDITY.

The freedom which State Socialism would repress in the community, physiology with its doctrine of heredity would combat in the individual:—

Fifty years ago a man's chance of extricating himself from family failings seemed an extremely fair one. . . But we see more clearly than we did that everything which has once been in the race, endures as a permanent influence modifying it, and that family types are apt to remain scarcely alterable for generations. Even if a particular man can flatter himself with reason that he has escaped or conquered a vicious tendency, he knows he is doomed to see it reappear in his

children. Now the fatalism of science in this direction seems to be of a more hopeless kind than the old theological doctrine of predestination to life eternal or death eternal. In Calvinism the doomed man does not know his fate.

After dwelling on this gloomy prospect, Dr. Pearson mercifully reverts to the other side.

Science has not said its last word yet upon this question of heredity. Even history can assure us that the cumulative transmission of qualities does not always or necessarily work for evil. . . We can point to no particular epoch of regeneration, but we see that at the end of a few centuries there has been enormous change for the better in [certain] particulars. . . We may accept the doctrine of heredity in its extremest form, and yet believe, that its apparent consequences are perpetually eluded, as new combinations of race are formed or as training and environment determine life.

SCIENCE CANNOT STAY THE SOUL.

In astronomy, in mechanical science, and in chemistry the progress has been magnificent, and the general tone of men of science accordingly is hopeful and jubilant. . . But the sadness, if it show itself, will not be because there has been any notable failure in the achievements contemplated. Knowledge will give us all it promises, for the foundations of the great work have been laid, and what remains is only to carry up the walls heaven-high. Yet it is conceivable that, when man has subdued the forces of nature to his will, and is "ransacking the infinite seas of knowledge, and figuring that knowledge in æsthetic forms eternally new and bright," there will still be a sinking at the heart, because that which stimulates the brain cannot of itself stay the soul.

Dr. Pearson acknowledges the phenomenal expansion and progress of the English race. But India? Egypt? Home Rule?—each of these appears with an interrogation point. France with its decline in population offers him a more mournful prospect:—

Now, it is the habit of Englishmen to ascribe this particular fact in the history of modern France to the enfeebling of the people through immorality. Those who know France best do not, however, share this opinion, and ascribe it to the higher standard of comfort which has become universal, and which leads men to marry late and to restrict their families. Unfortunately, the reason which is ethically more satisfactory is politically more alarming.

He grants that the Catholic revivals have succeeded up to a certain point, "but will any sane man contend that they have been adequate?"

Of course, Clough may be explained away, but are the professed believers in a general way more hopeful? The best of them, as a rule, only invite us to abjure our virility, to renounce science and all its works, and to reconstitute a system, which has failed conclusively, upon slightly more reasonable lines. Pessimism is the highest attitude a religious mind can take up in the face of such teaching.

THE HEBREW PROPHETS PESSIMISTS.

Dr. Pearson ventures on a statement which he will find it hard to verify when he says:—

Hebrew prophets were for the most part pessimists. Yet these men were the conservators of the spirit of nationality, and when the stroke of doom fell upon them they were able to bear it with dignity.

Is it not conceivable that, of the two great inspirations which society needs, and which it is impossible to weigh out evenly in balances, the pessimism which accepts death and defeat beforehand may be even more desirable as a permanent force than the optimism which sees the first presage of victory and animates for the charge that decides the fight?

If Dr. Pearson claims to be only a pessimist of the type of the Hebrew prophets, who are among the highest exponents of human hope, we shall be delighted to hear his modern counterpart to their fair pictures of the good time coming.

IS THE ENGLISH DRAMA DECLINING?

"No," SAYS MR. H. A. JONES.

THE mission of the pessimist seems to be to make hopefulness more pronounced and explicit. The replies which Dr. Pearson's book on *National Life and Character* is eliciting, furnish a case in point. For example, his gloomy observations on the prospects of the English stage have called out from Mr. Henry Arthur Jones, in *the Nineteenth Century*, one of the cheeriest of forecasts concerning our national drama. Mr. Jones finds food or rejoicing in the very fact that Dr. Pearson has devoted seven out of his three hundred and forty-four pages to the subject.

Twenty years ago it would have almost been impossible for a philosophical or sociological forecast to have glanced at anything so trivial as the future of the English stage.

DOES SHAKESPEARE SPELL RUIN?

Mr. Jones then proceeds to rebut one by one Dr. Pearson's charges.

He goes on to say, "Unfortunately the age is no longer tolerant of work with a high aim." So far as this refers to Shakespeare it is scarcely true, for Shakespeare's plays have drawn far larger houses and commanded longer runs in this generation than they have ever drawn and commanded before.

But Dr. Pearson continues: "It has become a proverb that Shakespeare spells ruin, and the exceptions to this are where popular actors give the stage version more or less infamously garbled with such gorgeousness of costume and surroundings that the mind is diverted from the words to the presentation." . . . Who has infamously garbled Shakespeare in these days? The tendency of this age is to restore the text of Shakespeare, to preserve it superstitiously.

"GORGEOUS MOUNTING."

When Dr. Pearson blames the present gorgeous mounting and lavish scenery, it seems to me that, to a great extent, he contradicts what is surely implied in his first admirable sentence about the stimulation and instruction to be gained from seeing a play "well put on the stage." . . . But to this generation that means "gorgeous costumes and scenery." Now that we playgoers have become used to these beautiful settings, we should be certainly more distracted and disturbed by their absence than we are by their presence. I am persuaded that if Shakespeare lived to-day he would rejoice in the beautiful illustration of his plays that is now always accorded to them by the better West End theatres.

Mr. Jones also believes Shakespeare would be "very tolerant" of the "rearrangement and cutting of scenes" necessary to the revival of his plays. "He had the keenest sense for what was effective on the boards."

OTHER ELIZABETHAN PLAYS.

But Dr. Pearson also accuses the present age of being intolerant of work of a high aim because the works of Shakespeare's contemporaries are not placed on the stage. Now . . . Elizabethan plays outside Shakespeare fail, or would fail, on our regular stage to-day, and with our present play-going public, not because of their high and noble qualities, but because those qualities are marred and obscured by imperfections in design and puerilities in the conduct of the story. They fail, not because they are too good, but because in certain very important stage qualities they are not good enough. For instance, it would be impossible to put certain scenes in Marlowe's *Jew of Malta* before any cultured English audience without provoking shouts of laughter.

Mr. Jones is ready to hope for the reproduction of some of these plays. The Independent Theatre has performed *The Duchess of Malfi*. The university students at Oxford might use "their annual dramatic excursions" to this end.

A HOPEFUL PROPHECY.

Another complaint of Dr. Pearson's is this:—

"We find that the serious work of modern times is never even regarded. Shelley, Browning, and Tennyson are experimented on from time to time, and put away almost instantly; Byron's name has not recommended his dramas; Swinburne has never been tried."

To which Mr. Jones replies:—

Shelley, Browning, Tennyson, and Byron do not fail on the stage because they are poets; they fail because they are not dramatists. . . . And it is scarcely true to say that Tennyson has failed. I know of nothing so flattering to the modern English drama as the intense interest latterly shown by Tennyson in the Theatre, and the pretty, touching stories that are told of his eagerness to win a success on the boards. . . . Tennyson has achieved a very great success during the last season, and stands a good chance of being continuously reproduced.

Further, Dr. Pearson says that the success of Bulwer Lytton and Sheridan Knowles "seems to show that the public is really tolerant of the drama only when it is bad." But Bulwer Lytton and Sheridan Knowles, because they wrote fustian literature, have been found out and are virtually dead on our stage to-day.

Once more, Dr. Pearson says, "The world everywhere is more orderly and reticent than it was, and less suited to theatrical effects." Perhaps so, and our drama will accordingly follow suit. Already we see a great reduction of gesture and mere ranting on our modern stage, and actors convey their meaning by quieter and subtler methods. But this does not mean the extinction of the drama.

To sum up, I believe that the English drama has never since the days of Elizabeth had such a chance of establishing itself as a national art and as a great power in our national life as it has to-day. Of course, very little has been accomplished as yet. Nothing has been garnered yet, and very little has flowered. But the ground has been prepared, and the seed sown. I believe that the work of the last ten years is bound to be immensely productive in the future.

Spitting a Sign of Devotion.

In the criminal investigation which led to the suppression of their order, "the Templars themselves admitted that they had gone through the ceremony of spitting on the Cross at their initiation." This was regarded by their judges as chief among their many crimes. Mr. James E. Crombie, in the *Gentleman's Magazine*, feels this to be too harsh a judgment, and tries to find a more charitable explanation. He quotes authorities to show that with the Masai tribe in Africa spitting "expresses the greatest goodwill and the best wishes." "You had better spit upon a dameel than kiss her." "In Russia and Turkey and Greece, and anciently among the Romans, it was, and is, considered a serious breach of etiquette to praise an infant and omit to spit on it or near it."

In the North of England "a strike for a rise of wages used never to be begun till the men had testified to their intention of standing by one another by spitting on a stone:" and "the boys used to spit their faith."

Part of the Scottish betrothal ceremony consisted in the contracting parties wetting their thumbs with saliva and pressing them together, at the same time as they swore to be good and true. Nor was this practice confined to marriage contracts only.

Mr. Crombie therefore concludes:

when we consider that spitting at a secular contract was a common occurrence, and that the motive was to make it more binding; when we consider that probably the Templars themselves did it at the making of their ordinary contracts with this motive, it seems a much more logical conclusion to come to that it was with this motive also that they spat on the crucifix when they took the oath of the order and enrolled themselves as soldiers of Christ.

MARY MAGDALENE'S GRAVE.

A VISIT TO THE SHRINE OF ST. BAUME.

THE *Nouvelle Revue* of September 15th is distinguished by several good articles, notably a description of the St. Baume Pilgrimage in Provence, by M. Albalat. It is there, in a quaint little town situated not far from Marseilles, that Mary Magdalene is said to have spent the last thirty years of her life. Fifteen thousand pilgrims visit the spot annually, and under the old régime scarce a king of France but came humbly to the site which is always carefully guarded by a number of Dominicans.

The legend runs that Mary Magdalene came from Judæa in a small boat, with Lazarus, Martha, the two Marys, and Salome, bringing with them the body of St. Anne, the head of St. James the Less, and a few wee bones of the innocents massacred by King Herod. But from early ages this story has been disputed, and the Abbé Duchene, one of the most erudite writers on the early Christian saints and martyrs, considers that the relics of Mary Magdalene were probably sent from Constantinople about the seventh century. A Greek breviary, however, speaks of the saint as having died at Ephesus. The pilgrimages are to a kind of grotto, which is supposed by local tradition to have been the place where Mary Magdalene spent her old age. Be that as it may, it seems that there is no older or more picturesque place of pilgrimage in Europe. In addition there can be seen at St. Baume a forest which has practically been kept intact since the days of old Gaul. The Dominicans' convent is practically the only inn in those parts, and every visitor had to put up with the severely plain accommodation provided by a monastic cell, and simple but clean food. The convent contains about one hundred beds; the lady visitors are served by nuns, the gentlemen by monks. The convent, which looks almost as ancient as the Grotto, is situated on the edge of a vast rocky chain of hills, and almost opposite the monastery half way up the steep incline is the famous grotto cut into the solid rock. There a wide platform is hewn out, partly occupied at present by a second convent.

The Grotto is about twenty-five yards square, eight yards high, and to all intents and purposes a chapel. The principal altar is surmounted by a fine statue, representing Mary Magdalene praying. It is strange to stand on the spot, apart from the feeling connected with the great saint to whom it is dedicated, and to think of all those who have stood in the Grotto. During the year 1832 five kings journeyed there: Philip of Valois, King of France; Alphonse IV., King of Arragon; Hugh IV., King of Cyprus; John Luxembourg, King of Bohemia, and the redoubtable Robert of Provence. Nine Popes; Petrarch, it may be, with Laura; Louis XIV., accompanied by his mother Anne of Austria, are a few of the many distinguished personages to whom St. Baume was a familiar place.

But the forest seems to be even more remarkable than the Grotto. M. Albalat declares that some of the oaks are over fourteen hundred years old. Eleven miles from St. Baume proper is St. Maximin, boasting of a great basilica built on the plains, and surrounded by an arid waste, which recalls Palestine and the country round Bethel. It was built at the end of the thirteenth century,

by Charles II. of Anjou, to contain the relic of St. Mary Magdalene. The choir contains ninety-four stalls, each surmounted by a sculptured medallion, representing an incident in the life of Mary Magdalene. But though the church itself is remarkable, the crypt, supposed to contain all that remains of the saint, is far more curious. There will be found empty spaces for the relics of the saints who are said to have accompanied her from Judæa; the ashes are waiting re-discovery.

M. Albalat strongly advises all those who wish to see a picturesque and utterly unknown corner of Provence to visit St. Baume without further delay. The spot is reached by a side line from Rognac. The visitor alights at Sensiers, situated twelve miles from the Grotto and prehistoric forest.

THE CRADLE OF EUROPEAN MONASTICISM.

THE island of St. Honorat is thus described in the *Thinker* by the Rev. Hugh Macmillan, D.D., in an article of much beauty:—

To the student of ecclesiastical history the little island of St. Honorat is one of the most impressive spots in Europe. Almost invisible on the map, it at one time occupied a most conspicuous position in the eyes of the world as one of its great historical sites. As a centre of intellectual and moral influence it had, as Montalembert truly says, a greater effect upon the progress of humanity than any famous isle of the Grecian Archipelago. . . . It may well be called the Iona of the South. It is a remarkable circumstance that two little insignificant islands, one in the far north, amid the dark clouds and mists of the wild Atlantic, and the other in the far south, under the brilliant blue sky, and laved by the bluer waters of the Mediterranean, should have formed the centres which drew to them, and from whence were dispersed, all the spiritual and intellectual forces of Christendom during its darkest ages.

Dr. Macmillan deserves thanks for recalling two beautiful legends told of the saint (fl. A.D. 410) who gave his name to the island:—

Meeting one day one of those wretched lepers, who . . . were as common in Europe in the early Christian centuries as they are now in Asia, he took him home to his own room, and began to anoint his terrible sores. Suddenly the dreadful mask of deformity fell off, and the scarred face burst out into overpowering radiance; and in the transfigured leper he beheld with inexpressible awe no other than the Lord Jesus Himself.

When St. Honorat left his northern home he was accompanied by his sister, who was devotedly attached to him. . . . The strict rules of monastic life would not allow the presence of a woman within the precincts. . . . The gentle and beautiful girl, who, at her baptism as a Christian received the name of Margaret . . . was consequently sent to reside in the neighbouring isle of Lero, where she was completely separated from her brother. . . . By her entreaties she at last prevailed upon him to promise to come and see her once a year. "Let me know," she said, "at what time I may look for your coming, for that season will be to me the only season of the year." The saint replied that he would come when the almond trees were in blossom. Whereupon the legend says the forsaken Margaret assailed all the saints with her prayers and tears, until she got her wish, that the almond-trees in her island should miraculously blossom once a month; and sending each month a branch with the significant flowers on it to her brother's retreat, he dutifully came to her at once, and her heart was thus made glad by the sight of her brother no less than twelve times every year.

THE *Review of the Churches* contains full official reports of the Reunion Conferences at Lucerne, with portraits of speakers. An American edition of the *Review*—to begin this month—is announced.

"THE FEMALE HOWARD."**WHAT AN INVALID WOMAN DID FOR THE WORLD.**

"The Female Howard" was the title given to Miss Dorothy Lynde Dix, who deserved in many respects a more enduring name than the Bedford philanthropist. E. A. Meredith in the *American Journal of Politics* for September gives an interesting sketch of this heroine, based on Mr. George Tiffany's recently issued biography. A brief reminder of a career which should be had in everlasting remembrance is not here out of place.

Born at the beginning of the century, she spent a miserable childhood. At fourteen years of age she began to teach, and worked until thirty, when her health completely gave way, but not before she had practically secured the two ends of a competence for herself and a fund to educate and start in life her two younger brothers. Not till ten years later was her attention called to the shocking condition of East Cambridge Gaol, Massachusetts, and her life work begun. It was a drama in four acts.

THE CHAMPION OF THE INSANE OF AMERICA.

1. A thorough examination of all the gaols and almshouses of Massachusetts led her to the discovery of the deplorable treatment of the pauper insane, confined as they were "in cages, closets, cellars, stables, pens; chained, naked—beaten with rods and lashes into obedience." Her memorial to the Legislature compelled it to take reform in hand. She next set herself "to induce the Legislature of each separate state to take immediate measures to provide suitable asylums for the accommodation of the insane within their borders." Before long she had "carried" the Legislatures of New Jersey, Indiana, Illinois, Kentucky, Tennessee, Missouri, Mississippi, Louisiana, Alabama, North Carolina, South Carolina, and Maryland. She also moved the Canadian Government in the same direction. A large appropriation of land on behalf of the indigent insane, imbeciles, and the like in the Union was carried through Congress by her efforts in 1851, and only defeated by the Presidential veto. At the same time she was doing "as wonderful" a work in the reformation of gaols and almshouses, and found time to get an exposed island off Nova Scotia provided with lifeboats and auxiliary apparatus.

REVOLUTIONISING BRITISH LUNACY LAWS.

2. Broken down and in quest of rest she came to England in 1854, but within a few months after her arrival she set about investigating the Scottish asylums. Her reports and her influence led to the appointment of the Scottish Lunacy Commission, and eventually to the Act of 1857, which "revolutionised the Lunacy Laws of Great Britain." She next introduced reform into the Channel Islands. Then she attacked the Continent.

In feeble health, alone, and entirely ignorant of all the European languages, excepting French, of which she had only a slight knowledge, in twelve months she traversed Italy, Greece, Turkey, Austria, Russia, Sweden, Norway, Holland, and Belgium, returning by way of France to England. . . For the insane in the hospitals in Petersburg and Moscow she had nothing to ask. They possessed every comfort and all needed care. Again she found a very well directed Mohammedan hospital at Constantinople and an excellent asylum at Naples in King Bomba's territory; but one of the worst of all at Rome, under the shadow of the Vatican! With reference to this last she had an interesting interview with Pope Pius IX, with whose saintliness and benignity she was much impressed.

QUEEN OF THE WAR NURSES.

3. In 1856 she returned home to renew her crusade on

behalf of the insane, carrying legislatures and eliciting munificence in an extraordinary manner. On the outbreak of the Civil War, she was made superintendent of women nurses in the general and military hospitals, with almost unlimited powers. At the close she was offered a reward by Congress, and asked what she preferred to receive. "The flag of my country," she answered. Eighteen months more were spent in looking after widows and orphans and nurses—left destitute by the war.

4. Then she felt called to traverse the length and the breadth of the country to renew legislative interest and personal generosity in regard to the asylums, which the dislocations caused by the war had brought into a lamentable state. Up to her death in 1881, in her eightieth year, she never abandoned her rôle of knight-errant of suffering humanity:—

Whenever any great calamity occurred like the terrible fires which destroyed such large portions of Chicago and Boston, Miss Dix was sure to be on the spot with sums of money which she had collected from her friends, and quietly and judiciously searching out for herself when help was most needed, or what persons already on hand could be relied upon to expend the fund most wisely.

This life of wonderful activity was but an alternation of severe effort with complete breakdown in health. To the self-effacing humility of the heroine must be attributed the comparative oblivion into which her name has sunk.

THE BEHRING SEA AWARD.

A WRITER in *Blackwood* reviews the history of "The United States in International Law" in a spirit not too friendly to the States:—

More than any other nation in the world, the United States accepts the law of nations as an integral part of the law of the land. . . . In effect, the Americans look, or profess to look, on international law as a system of morals, from which the positive laws and prescribed usages of nations must not be separated. . . . This being the state of things, it is remarkable that the United States public men should be found through their whole history urging points of view regarding the law of nations which all other nations had rejected, and putting forward claims based on grounds too remote for serious consideration.

An explanation is found in the statement that the conduct of the Senate, with whom lies the control of foreign policy, "is ultimately determined, not by considerations of national honour and international law, but by the consideration of party necessity."

He does not "predict finality for the decision" on the Behring Sea question:—

The whole subject of these regulations, the general effect of which is more favourable to the American seal-fisheries than any one could have imagined in view of the total failure of every point of international law on which the American case rested, will need and will probably receive consideration. . . . This award may be finally accepted without protest; but if so, it will be, not because it is quite in accord with the rules of international law—

but because of British magnanimity.

A compliment to Canadian statesmanship should be noted:—

The British case, presumably prepared in great part, if not altogether, under the control of or in person by the members of the Canadian Ministry . . . is prepared in a manner calculated to excite a feeling of satisfaction that the public service of the Colonies and of the Empire can still command the use of very extraordinary ability for very insignificant rewards.

"BRITANNIC" CONFEDERATION.**A SCHEME FOR THE IMPERIAL INSTITUTE.**

MR. ARTHUR S. WHITE, editor of a series of essays by eminent authors on "Britannic Confederation," described in the *Asiatic Quarterly* the initial steps which in his view should be taken towards the unification of Greater Britain. He recognises the growth of Federation sentiment at home and in the Colonies. He admits that a *Zollverein* is at present impossible, "owing to the immature development of the Colonies," but declares that a *Kriegsverein* is not only immediately practicable, but is needed. Since the Home Government will not urgently, and the Colonies cannot, take the initiative, he suggests that the Governing Body of the Imperial Institute should become the "accredited agency," with the "object" of promoting "an inviolable political union between the mother country and the self-governing Colonies." "Sub-agencies" should be formed by this body in the Colonies.

AN IMPERIAL INSTITUTE CONFERENCE.

A Conference shall be summoned by the Imperial Institute, at the instance of H.R.H. the Prince of Wales. The Delegates shall be the Representatives on the Governing Body, who shall be aided by specialists. A programme shall be drawn up by a Special Committee and submitted to the Conference. This Programme, after receiving the sanction of the Conference, shall be submitted to the Home Government and the Colonial Legislatures for acceptance in principle. . .

Our vast Indian Empire is and must remain, in the strictest sense, an Imperial dependency. As such, its representatives on any Colonial Council or at any Conference must be the representatives of the Crown of India.

Mr. White submits a draft "programme likely to receive general support." Its chief unitive features are these:—

The Imperial Army and Navy shall be exclusively responsible, as at present, for the safety and protection of the Empire, with the loyal co-operation of the Colonies. The Colonies shall provide harbour and coast defences at their own expense, to ensure safety against surprise by a hostile Power, such forces to be regarded as a Volunteer arm of the Imperial Services. Garrisons of Imperial troops shall be maintained, as now, at the chief strategical outposts of the Empire, at the expense of the Home Government; but the Colonies shall increase their Volunteer establishments for exclusive use in their respective Colonies, to be placed in time of war under the command of the Home Government.

A COLONIAL COUNCIL.

A Colonial Council shall be formed, consisting of Her Majesty's Colonial and Indian Advisers and the Agents-General of the Colonies, whose duty it shall be to watch British Colonial interests, and to promote and maintain inter-relations between the Mother Country, India, and the Colonies.

The Imperial Government shall guarantee, subsidise, or otherwise assist trans-oceanic communications, the laying of cables and postal facilities between the Mother Country, India, and the Colonies. Armed cruisers, or mail-boats convertible as such, shall be maintained on the chief highways of British commerce by subsidies from the Home Government conjointly with the Colony or Colonies most interested.

A COMMERCIAL BUREAU FOR THE EMPIRE.

A Commercial Bureau shall be formed, within the Imperial Institute, to gather and disseminate information concerning trade and commerce—British, Indian, Colonial, and Foreign—and to promote in every way closer and more advantageous commercial relations between the Mother Country, India, and the Colonies. This Commercial Bureau shall have its headquarters, or at least a branch, in the city of London, together with agencies in every colony and in India.

The Public Services shall be open to all duly qualified British subjects, with the approval of the Crown. A special effort shall be made to enlist British subjects in the Colonies

in the Imperial Army and Navy, on the understanding that they shall be kept on duty in their respective Colonies.

The cost of maintaining all British Dependencies shall fall, as now, unless otherwise arranged—as in the case of India—on the Mother Country. The entire cost of the Diplomatic and Consular Services shall be borne, as now, by the Mother Country; but it shall be allowable for any Colony to maintain a commercial *Attaché* on the staff of any British Embassy, or Legation, or Consulate-General.

COMMON DEFENCE FUND.

The Colonies shall contribute a fixed annual sum of money to a common fund for the defence of the Empire. The contracting parties shall formally recognise the obligation to uphold and maintain the unity of the Empire as at present constituted.

Schemes of this kind are welcome if for no other reason than because they show we are passing from the stage of pious aspiration to that of practical initiative. But why "Britannic" Confederation? English-speaking is the only adjective wide enough to include the Irish.

THE WORLD-DRAMA IN DANTE'S COMEDY.

THE "historical presuppositions and foreshadowings" which Mr. W. M. Bryant finds in Dante's great poem are set forth in the *Andover Review* in style and substance richly reminiscent of Hegel's philosophy of history. The writer's mind has manifestly succumbed to the spell of the magic number three:—

Man is essentially a threefold being. He is at once a power to know, a power to do, and a power to feel. The highest mode of man as a power to know is called Science; the highest mode of man as a power to do is called Government; the highest mode of man as a power to feel is called Religion. To know the world, to wield the world, to experience the rhythm of the world—all these in one—that is to be concrete Man. And concrete man is Divinity in process of unfolding. . .

Of all the nations of antiquity three unfolded each a special one of the central phases of man's nature. . . The Greeks were the first world-knowing people. . . The Romans were the first world-ruling people. . . The Hebrews were the first people to feel keenly, surely, with all its fulness the great divine rhythm of the world in its deepest spiritual import. For this reason it was a Hebrew who first seized, as with divine vision, the utmost import for man of the central principle of *Personality*—the principle that once for all lifts man to a divine level and reveals the *Real Presence* of the creative Mind in all the infinitely varied forms of the actual world.

Modern civilisation is the chemical fusion of Greek, Roman, Hebrew elements, which the Teutonic spirit has known how to blend in finest proportions and to raise to highest life.

Thus it may be said that the Ancient world was a world of isolation, of mutual distrust, of irrepressible antagonism—that is, a very Inferno of negotiations. So, also, the Middle Ages constitute a period of interfusion, of physical and spiritual collision, of cumulative earnestness and depth of inquiry, of the gradual balancing and clarifying of the minds of men—that is, a painful but promising Purgatorial state for humanity. And finally the Modern world is the period of discovery, of growing clearness of intelligence, of increasing mutual confidence and helpfulness—that is, a state in which humanity is realising in ever-increasing degree the genuine rhythm of Paradise.

So each member of the race, beginning as a simple individual, must struggle through contradictions and negations, until he attains "concrete personality."

Clearly, then, this also is a fundamental feature of the eternal world. And no one of all mankind has realised the fact more vividly than did Dante himself, lifted as he was on the very crest of that mighty purgatorial wave in the time-aspect of this world's history known as the Middle Ages.

THE SITUATION IN SIAM AND THE FAR EAST.

REFLECTIONS on the new situation in Siam continue to occupy the attention of magazine readers. In the *Scottish Geographical Magazine* for September, Mr. Coutts Trotter, F.R.G.S., gives much valuable information about the Siamese frontier (with maps), people, and trade. Tongking, Annam, and Cochin China ought, he urges, to be regarded not as separate countries but as one, "inhabited by one dominant race, the Annamese, which is akin to the Chinese."

THE BRITISH CASE IN SIAM: BY MR. CURZON.

In the *North American Review* for September, whose editor is careful to present his readers with opposing views of the Siamese question, Mr. Curzon thus states the situation from the British standpoint:—

Without much effort, with no great loss of men and no enormous outlay, she has succeeded in humiliating her petty Asiatic neighbour, has extorted from his exchequer £120,000 for damages which would have been exorbitantly assessed at one-tenth of that total, and has stripped his dominion of some seventy thousand square miles. I do not say much about the morality of the proceeding, partly because no two opinions can be held concerning it; partly because morality seems to be out of vogue in international politics.

The main object with which the French have embarked upon this enterprise has been the hope of diverting from Bangkok, and securing for Saigon, the trade of the Mekong Valley; and in the last resort of winning for France, and snatching from England, the commercial spoils of Yunnan. In this expectation I believe that they will be cruelly disappointed. . . . The Mekong River, by reason of its numerous rapids, is utterly unfitted for continuous or lucrative navigation by steam-power; whilst there is not a town of any importance upon its banks but Luang Prabang. . . .

Furthermore, if obeying the inevitable law of advance, the French, not satisfied with their present acquisitions, attempt still further encroachments upon the integrity of Siam, they are not unlikely to find themselves brought into conflict with both China and Great Britain. . . . England, for her part, cannot acquiesce in any further advance that would have the effect of squeezing the buffer State of Siam out of existence, and of planting herself and France face to face in Indo-China. Siam has been humbled and mutilated; we could not be equally indifferent to her extinction.

MADAME ADAM ON THE FRENCH CASE.

Knowing and greatly esteeming the singular abilities of Madame Adam, we turn to her statement of the French case—and find what we expect. It is simply the cry of "perfidious Albion" long drawn out, interspersed with more or less doubtful compliments at the expense of the French Government to English boldness, promptness, and persistency. Here are specimens of the only kind of argument advanced:—

Whenever France has had a difficulty, England has either produced, intensified, maintained it, or prevented its being overcome. She has ever been the enemy of France, and owes her power to her not forgetting that fact for a moment. A sinister law—discovered or, rather, formulated by one of the bold thinkers of England—governs, and will increasingly govern, the relations of English and French national life. This law is the struggle for existence! . . . Is it possible, in this age of struggle for existence, to resist Old England's triumphant, superb and enviable resources of aggression otherwise than by aggression of the same kind?

In eight pages of this sort of thing we fail to detect so much as a single reference to the rights of the Siamese, which increases our estimate of the shrewdness of Madame Adam.

"WAVERING AND WOBBLING."

According to a writer in *Blackwood*, France and Russia are leagued in a settled endeavour to destroy British power and British trade. Against the "boundless ambition" of France

British interests in Siam have been inefficiently safeguarded. . . . How our facile Foreign Secretary came to assure the French that it was "of no consequence," is a matter for which he will be surely held to account at the bar of history, if nowhere else; for it seems—from all that is as yet known of it—as perfect an example of doing just the wrong thing as it is possible to imagine. As Russia was warned off meddling with Egypt in 1877, by the clear notification of British interests there, so France would have been warned off Siam by a similar declaration, even as late as the spring of the present year. Straightforward and timely assertion of rights, with clear definition, backed up by unswerving resolution to maintain them, is the surest way to keep the peace among nations. The wavering and wobbling invite aggression, and deserve it. . . . A ring-fence of inflexible national resolution thrown round our whole empire, with all its interests, without petty discrimination, would be at once the simplest and the safest form of national defence.

ANNAM AND THE ANNAMITES.

Hon. G. R. Curzon, M.P., in the *Geographical Journal* for September, concludes the story of his journeys in French Indo-China. He describes the Annamites as an exceptionally gentle and amiable race, possessing marked industrial and artistic aptitudes, "tenacious in resistance," "hospitable, polite, lively, sentimental, and of easy temper," at the same time "tricky and deceitful, disposed to thieve when they get the chance, mendacious, and incurable gamblers." Of the produce of the coal-fields of Annam, which are being developed by British capital, he says that:—

The best quality burns well, being a fine bituminous coal; but the coarser samples require a greater draught than most grates admit of, and also crumble easily to coal-dust. To utilise this residuum a briquette factory is about to be established at Hongai. One phenomenon these mines present, which I imagine must be unique in the world. At Hatu I saw a solid seam of black coal 180 feet in depth, exposed down the entire front of a hill; nor had the bottom of the seam yet been ascertained.

The Burmese Slowly Dying Out.

A DELIGHTFUL article on a dolorous theme is that by Mr. G. H. Le Maistre in the *Asiatic Quarterly Review*. In bright and vivid sentences he depicts "the gradual extinction of the Burmese race." The Burman is "the prince of easy-going fellows." A prolific soil needs scant exertion to produce ample supply for all his wants, and most of the work that is necessary he makes his wife do for him. Had he been left undisturbed in his charming land, he might have lasted for many a generation in genial idleness. But in this crowded world the Fates are not propitious to lazy men. The downfall of King Theebaw opened this luxurious paradise to more enterprising nations. Hardworking Hindus and Chinamen came in numbers. They began to develop the latent wealth of the soil. They were encouraged by the Government, for their enterprise meant the repletion of its hungry treasury. The self-indulgent and lethargic Burman has no chance with such competitors. He sinks inevitably. The Burmese women prefer for husbands the kinder and wealthier foreigner.

Only time is required for the pure Burman to disappear altogether, and for his place to be taken by a race in whose veins the blood of the Chinaman and of the native of India will mingle with his own.

HOW OUR POST OFFICE GREW.

In the *Economic Journal* for September, Mr. A. M. Ogilvie gives a most interesting sketch of the origin and development of the English postal system:—

It was not until the reign of Henry I. that the business of Government required the regular employment of persons for the conveyance of letters. Under Edward III. fixed stations were established, at which the Royal *Nunci* could change horses. Henry VIII. appointed Brian Tuke to be the first "master of the posts," chiefly to supervise these change-houses. Edward VI. and Elizabeth spent large sums in making the system efficient, but it was only when the requirements of the royal messengers had been satisfied that private messengers could get horses, and at an almost prohibitive charge of 20d. for every stage of seven miles. The royal messengers carried no private letters, except by favour.

A post to the Continent, started by Flemish trades in England early in the sixteenth century, and in 1558 the office of the "master of the strangers' post," was combined with the mastership of the royal posts.

This double service was the nucleus of the English Post Office. The two Universities of Oxford and Cambridge early in the seventeenth century, or perhaps even earlier, established posts to other parts of the country for the use of their members, but these services, unlike the corresponding services of the University of Paris, never became parts of the national system.

THE FIRST POSTAGE RATES.

Thomas Witherings, postmaster to Charles I., opened the royal posts to the public.

The first postage rates were as follows: for a single letter, i.e. a letter on a single sheet of paper, 2d. for distances of 80 miles, or less. For 140 miles, or less, 4d. For any longer distance, in England, 6d.; and to Scotland, 8d. For double letters these charges were doubled. . . . It is often said that it was never intended in the establishment of the Post Office that it should yield a profit. This may be true of an ideal Post Office; but it certainly is not an historical fact. Since 1650 there has not been a year when the Government, with the full sanction of Parliament, has not used the postal service as a source of revenue; and very often it has been administered solely for this purpose.

PENNY POST IN LONDON IN 1682.

Until the close of the reign of Charles II. posts were from town to town and not from one part of a town to another. Letters might be sent by post to places a few miles away, but there was no local service even in London. The want of such a service was felt as the suburbs grew. In 1682 William Docwra took over a private business of collecting and delivering letters and small parcels in London and Westminster and the nearer suburbs, established by a man named Murray a few years before. He opened new offices, and delivered letters and parcels up to 1lb. in weight and £10 in value for one penny each in London and Westminster, and for twopence each within a distance of ten miles.

This system was suppressed as illegal, but taken over and made a branch of the Post Office, with Docwra as comptroller. In 1709 an attempt by Charles Dovey to set up a halfpenny post was also suppressed.

FROM POST-RIDER TO MAIL-COACH.

The next great event in Post Office history occurred in 1784, when the use of coaches for the conveyance of mails was begun on the suggestion of John Palmer, who was strongly supported in his proposals by Pitt. The change was made not so much for speed as for security. The mails had increased very much in bulk, and were often more than the post-riders, who up to that time had been employed, could properly carry on horseback.

In 1839 came the great reforms of Rowland Hill. The same year the money order system was adopted. In 1870 the telegraph system followed. Despite the enormous increase in business—

The balance paid into the Exchequer is much less in proportion to the gross revenue than before the Penny Post began. In 1839 the cost of management was equal to 35 per cent. of the receipts. In 1872 it had risen to 72 per cent., and for 1892 it was about 80 per cent.

WHY NOT POSTALISE RAILWAY TRAFFIC,
AND GO AS FAR AS YOU LIKE FOR 2½D.?

This popular plea is urged by Mr. James L. Cowles in the *Engineering Magazine* for September. Why not, he asks, adopt the same principle in charging for the transmission of persons and goods as in charging for the transmission of letters?

A two-cent stamp will send a letter from Eastport, Maine, to Seattle, in Washington. Is there any essential difference between the transportation of the mails and the transportation of other freight and of passengers? On some railways the mails weigh almost a tenth as much as the passengers carried, and the actual income of American railways from the carriage of the mails in 1890 was nearly one-tenth as much as from the passenger traffic.

The principle has been applied with remarkable success to horse-car lines, electric tramways, "elevated railways," and the like. One of the main arguments against its further application Mr. Cowles meets by the proposition, which is also the title of his article, "Distance not a Factor in the Cost of Railway Traffic." He adduces statistics to show that "the cost per ton and per passenger is practically the same on the heavily-laden through-train and on the comparatively light way-train" (local-train). The through-train "wastes neither the time nor the fuel lost by the way-train in frequent stops." The main business of a railway must always be local traffic.

This is what he desires to see introduced:—

An ideal condition will be attained when the consolidation of railway systems, now under way, has been completed, and the lowest rate charged between any two stations in each particular class of service has been adopted as the standard rate for such service between all the railway stations in our country. The standard rate on passenger way-trains in the eastern part of the United States, under this rule, would be five cents per trip, and on express trains the rates would be practically in inverse proportion to the number of stops. If the stops on the express were one-fourth as many as on the way-train, the rates would be four times as much as on the way-train. Again, since Pullman cars weigh nearly twice as much as ordinary cars, and cost twice as much, while carrying hardly half as many passengers, the rates by Pullman car would be at least four times as much as by ordinary cars.

On this plan, a man on payment of twopence halfpenny could travel as far as he pleased by ordinary car and slow train.

"The Ideal Artist and Man of the World."

So Miss Virginia Butler, in *Lippincott's*, describes the President of the Royal Academy, in a warmly appreciative account of an hour at his house:—

As we entered the studio, we were met by the host, one of the most finished gentlemen, as well as one of the most accomplished artists, in Britain. . . . Strikingly handsome in face, manly and graceful in bearing, exquisitely polished in manner, picturesque in costume, he seems a realisation of the ideal artist and man of the world. . . . Sir Frederick is a fine linguist: Italian, German, and French are as familiar to him as his native tongue. A man must touch the world at many points,—such is his theory,—must have a wide acquaintance with man and nature, must be catholic in sympathies and tastes, must be a student of books, must have a knowledge far beyond the mere boundaries of his especial art, before he can be a consummate artist; and this, which is the philosophy of the true artist's culture, Sir Frederick completely illustrates.

AN URGENT PLEA FOR PENAL REFORM.

By MR. MONTAGUE CRACKANTHORPE.

"NEW WAYS with old offenders" is the taking but rather inadequate title of a most instructive essay by Mr. Montague Crackanthorpe, Q.C., in the *Nineteenth Century*. It is really a review of our present penal system and of suggested reforms, treated as a chapter in the science of punishment. Full of fact and weighty reflection as is the first part, the second, which marks out the steps yet to be taken, need alone be dealt with here. The writer confines this part of his investigation to three points:—

1. What is the true measure of criminal punishment?
2. What weight should be given to a previous conviction when sentencing for a second offence?
3. Can any means be devised for making sentences more uniform?

THE MEASURE OF PUNISHMENT.

Mr. Crackanthorpe answers the first by saying:—

The measure which our law primarily regards is the *injury done to social order*, that is to say, to the community of which the offending person is a member: not as Sir J. F. Stephen holds—

The sentence of the law is to the moral sentiment of the public in relation to any offence what a seal is to hot wax. It converts into a permanent final judgment what might otherwise be a transient sentiment.

Nor as Sir Edward Fry, that the main criterion of punishment is "the adaptation of suffering to sin," "the adjustment of pain to vice." The essayist's own conclusion is as follows:—

Ranging the factors of a criminal sentence according to their relative weights, the order appears to me to be this. Preventive justice first, reformatory justice second, and retributive justice a bad third.

SHALL PREVIOUS CONVICTIONS COUNT?

To the second question, widely diverse answers are given:—

School No. 1 ignores the previous conviction entirely. School No. 2 treats it as a ground for seriously augmenting the sentence. School No. 3, compounding with the other two, treats it as depriving the offender of the benefit of the mitigation of sentence to which it deems him, in ordinary circumstances, to be rightfully entitled.

In the case of a person convicted for the first time of an offence punishable with imprisonment, a French tribunal may now, after pronouncing such definitive sentence as it thinks right, order execution of the sentence to be conditionally suspended. The condition is that if within five years the convicted prisoner is found guilty of crime his original sentence is carried out in its integrity. If, on the contrary, he abstains from crime during that period, the original sentence becomes null and void. When a man who has been so conditionally condemned is convicted a second time, his second sentence is by the *loi Bérenger* more severe than it would have been had the first sentence not been pronounced.

Than this French plan Mr. Crackanthorpe thinks—

No expedient could be more efficacious as a preventive against a relapse. The "conditional condemnation," like the "conditional release" in our own ticket-of-leave system, puts the subject of it on a genuine and not a sham probation.

HOW TO MAKE SENTENCES UNIFORM.

To secure something like uniform sentencing, Mr. Crackanthorpe thinks the Court of Review proposed by the Judges would not be sufficient. His own proposal is—

that a Royal Commission be appointed to frame such a rule or rules on the plan of Lord Grey's Commission of 1863, which

organised our system of Penal Servitude, or of Lord Aberdare's Commission of 1862-4, which organised our Reformatory System. Both these systems, though largely the creations of speculative opinion, were placed on a solid basis by the labours of those two Commissions. It is not too much to expect that the proposed new Commission would be equally successful.

The recommendations arrived at should be circulated by the Home Office throughout the country. There would thus be gained the authoritative enunciation of general rules, their application in each case being left to judicial common sense.

MR. GOSCHEN'S "CROOKED FINANCE."

MR. W. A. HUNTER's article in the *Contemporary* under the title of "A Story of Crooked Finance" gives us an exposition of what he regards as the shortcomings of Mr. Goschen's finance. It certainly savours more of the bombardment that goes on in the hottest crisis of a general election than of the cooler intervals of parliamentary life. Mr. Hunter plants his battery on the recently published Return on Local Taxation in England:—

According to Mr. Fowler's figures, in the year 1892 no less than £11,846,482 of a total, in round numbers, of £65,000,000 raised by imperial taxation in England, was applied, not for any object of imperial expenditure, legitimate or illegitimate, but for the purpose of reducing local rates; upon an average, this represents a lowering of local rates by 1s. 6d. in the £. But the full effect of Mr. Goschen's finance was not felt in 1892, for in the current year the imperial subvention in aid of the ratepayers will, in England alone, exceed £13,000,000, or one-fifth of the imperial taxation obtained from that portion of the United Kingdom.

THREE HEAVY CHARGES.

Based on these facts he hurls with increasing vehemence the threefold indictment:—

First, the system of imposing taxes to enable local authorities to lower rates was introduced by the Tories. Even in opposition they have, through the treachery of the Whig landlord element, attained some success; but it is when in power that they have done most, and under Mr. Goschen's fostering care the system has reached gigantic and alarming proportions.

Secondly, the system of imperial subventions is merely a trick, a sort of financial sleight-of-hand, whereby out of the poverty of the poor is extracted the means to augment the superfluities of the rich. Of a total for 1893 of imperial subventions for Great Britain of £10,600,000, no less than £7,000,000 is taken from the working class and lower middle class, and handed over to the richer ratepayer and owner of land and houses. From an ethical point of view, the proceeding is with difficulty to be distinguished from pocket-picking.

Thirdly, the persons who are made to pay the lordly tribute of £7,000,000 are precisely those who are most shamefully overtaxed, and the ratepayers who receive the plunder are those whose rates bear the lowest proportion to their taxable income. It is not merely robbery; it is robbery of the meanest and most despicable character—it is robbery of the poor by the rich. The class for whose benefit this odious abuse of the power of taxation is exercised have, per head, ten times the annual income of the poor people whose pennies they do not disdain to pilfer.

In the course of his strictures Mr. Hunter declares:—

That the working classes and the lower middle class would gain all over England about £24,000,000 a year if customs and excise were abolished, and the amount lost to the Exchequer were made up by levying a rate equally according to the valuation. But even then the working classes would still pay in rates much more than a fair proportion of their taxable income, in comparison with the richer ratepayers.

THE "EXPANSION" OF THE UNITED STATES.

SOME PROS AND CONS.

Is the American Republic to take after the mother-country and go in for a *maremperire*? That is practically the question which the projected annexation of the Hawaiian Islands has forced to the front. Mr. A. T. Mahan's answer in the *Atlantic Monthly* is in effect affirmative. He is distressed at the lack of broad national policy which the Hawaiian discussion has revealed. He is especially apprehensive of irresolution with regard to the interests of his country at the Central American Isthmus:—

So long as the United States jealously resents all foreign interference in the Isthmus, and at the same time takes no steps to formulate a policy or develop a strength that can give shape and force to her own pretensions, just so long will the absolute control over any probable contingency of the future rest with Great Britain, by virtue of her naval positions, her naval power, and her omnipresent capital.

A FORWARD POLICY.

If, on the other hand, we determine that our interest and dignity require that our rights should depend upon the will of no other state, but upon our own power to enforce them, we must gird ourselves to admit that freedom of interoceanic transit depends upon predominance in a maritime region—the Caribbean Sea—through which pass all the approaches to the Isthmus. Control of a maritime region is insured primarily by a navy; secondarily, by positions, suitably chosen and spaced one from the other, upon which as bases the navy rests, and from which it can exert its strength. At present the positions of the Caribbean are occupied by foreign powers, nor may we, however disposed to acquisition, obtain them by means other than righteous; but a distinct advance will have been made when public opinion is convinced that we need them, and should not exert our utmost ingenuity to dodge them when flung at our head.

COUNT THE COST!

Quite another view is upheld in *Harper's* by Mr. Carl Schurz, who administers a cold douche of caution to the enthusiasts of the "Manifest Destiny" school:—

The new "manifest destiny" precept means, in point of principle, not merely the incorporation in the United States of territory contiguous to our borders, but rather the acquisition of such territory, far and near, as may be useful in enlarging our commercial advantages, and in securing to our navy facilities desirable for the operations of a great naval power.

Remember what the "expansion" of a republic means:—

Let us admit, for argument's sake, that there is something dazzling in the conception of a great republic embracing the whole continent and the adjacent islands, and that the tropical part of it would open many tempting fields for American enterprise; let us suppose—a violent supposition, to be sure—that we could get all these countries without any trouble or cost. But will it not be well to look beyond? If we receive those countries as States of this Union, as we eventually shall have to do in case we annex them, we shall also have to admit the people inhabiting them as our fellow-citizens on a footing of equality.

DEMOCRACY AND THE TROPICS.

It is a matter of universal experience that democratic institutions have never on a large scale prospered in tropical latitudes. The so-called republics existing under the tropical sun constantly vibrate between anarchy and despotism.

Only Europeans belonging to the so-called Latin races have ever in large masses become domesticated in tropical America. . . . That Spanish-Indian mixture is evidently far more apt to flourish there than people of the Germanic stock, and will under climatic influences so congenial to it remain the prevailing element and the assimilating force.

THE GNAT AND THE CAMEL.

Imagine now fifteen or twenty, or even more, States inhabited by a people so utterly different from ours in origin, in customs and habits, in traditions, language, morals, impulses, ways of thinking—in almost everything that constitutes social and political life—and these people remaining under the climatic influences which in a great measure have made them what they are, and render an essential change of their character impossible—imagine a large number of such States to form part of this Union, and through dozens of Senators and scores of Representatives in Congress, and millions of votes in our Presidential elections, to participate in making our laws, in filling the executive places of our government, and in impressing themselves upon the spirit of our political life. The mere statement of the case is sufficient to show that the incorporation of the American tropics in our national system would essentially transform the constituency of our government, and be fraught with incalculable dangers to the vitality of our democratic institutions. Many of our fellow-citizens are greatly disturbed by the immigration into this country of a few hundred thousand Italians, Slavs, and Hungarians.

Yet these immigrants will soon be Americanised. What, then, of the introduction of a score or more whole States of Spanish-Indians who will never be Americanised?

THE LIMITATION OF IMMIGRATION.

"We must," says Mr. Arthur Cassot in the *American Journal of Politics* for September, "at all hazards guard ourselves against unrestricted immigration, to preserve our standard of living, our morality, and the homogeneity of our people." His grounds are:—

In the first place, sixteen per cent. of our immigrants are illiterate, and about a yearly average of four and eight-tenths per cent. or 25,306 of the male immigrants "are unskilled and untrained in any avocation." Secondly, the female immigration from Italy and Hungary is only 20·6, and 26·2 per cent. of the male. Thirdly, foreigners or their immediate descendants form about two-thirds of all the paupers supported at almshouses and one-third of all the inmates of our state prisons and penitentiaries . . . The most embarrassing of all this immigration comes from Southern Italy, Poland, Russia, Hungary, and Ireland.

The remedy he proposes is—

to enact a law in addition to the rigid enforcement of existing laws, which would exclude all immigrants above the age of twelve who cannot write freely and easily their native language, an exception being made for those over fifty-five years of age coming with other members of the family, and all male persons over fifteen years of age who are unskilled and untrained in any occupation.

DEPORTATION FOR THE AMERICAN-CHINESE.

Of the one hundred and ten thousand Chinese resident in the United States, Kurt von Staufen, in the September number of the *American Journal of Politics*, reckons that one hundred thousand belong to "the scum of all China." They are brought over on false representations, under a contract which is practically slavery, by the Six Companies of San Francisco. They are celibates, ignorant of the very meaning of virtue. They undermine American morality, undersell American labour, and lower the popular respect for manual toil. Their occasional alleged conversion to Christianity is open to the gravest doubt. They are by their very nature unable to understand its ethics. To attempt to evangelise them is really "a crime against home and native land." From these and other equally strong assertions, the writer concludes that—

The truly rational way to deal with the question is to settle it permanently, and that can only be done by the deportation of all the Chinese that compete in any way with American labour in any form whatsoever.

A PLEA FOR THE GOTHENBURG SYSTEM.

BY AN AMERICAN OBSERVER.

ARDENT prohibitionists in this country may be surprised to learn that Massachusetts, though so near to the home of the Maine Liquor Law, is meditating the introduction of the Gothenburg system. A commission has been appointed to investigate the Scandinavian method, and it is to be assumed that legislative action will follow its report. So Mr. E. R. L. Gould informs us in the *Atlantic Monthly*. He recalls the remarkable results of the system which has in twenty-five years reduced the consumption of spirits per head of the population, in Sweden by 35 per cent. and in Norway by 53 per cent. It has succeeded in countries so different as Finland, aristocratic Sweden, and ultra-democratic Norway. Mr. Gould points out that it presents many features not at all new to American practice:—

The fundamental basis, license with local option privileges, is the policy in many of the States. Neither is the application of moneys derived from the liquor traffic to objects of public utility a new thing.

The Norwegian is the model most akin to American possibilities.

NECESSARY MODIFICATIONS.

But, Mr. Gould insists, the system would have to be extended "so as to include fermented as well as spirituous liquors." For though the Scandinavian takes less spirits, he has apparently more than made up for it in beer; and "of late years drunkenness has been on the increase." Capital ousted from the distilling has gone into the beer-brewing business.

The great difficulty anticipated lies in the fact that—

The standard of municipal politics in this country is not what it is in Scandinavia, and this, in the light of what has been said of the intimate relation existing between the companies and the local government, apparently offers an insuperable objection. Many would think it better to leave undisturbed the present unholy alliance, than that liquor and politics should be more closely wed.

There need not be too many misgivings on this score. Wherever the system is in operation, notwithstanding municipal relationships, the saloon is absolutely without political significance.

THE LICENSING AUTHORITY.

"The crucial test of the American mechanism of the system would be the constitution of the licensing authority."

Mr. Gould does not look with favour on the idea of creating this authority by executive appointment or by local election. He would rather constitute it "from the judges of secondary instance, for example":—

The judicial power in the United States has been comparatively little infected by politics, and would be by far the safest repository of the required functions.

The Norwegian method of appropriating the surplus might be adopted. It would be well to fix by statute the specific objects to which the funds should be applied, so as to keep them from the misappropriating ingenuity of the "local politician." Among the different interests to be favoured by subsidies, Mr. Gould believes that kindergarten and manual training and agencies for healthy recreation should have the first claim.

IT WOULD ABOLISH THE SALOON.

Let us not be accused of lack of faith if we say that to transplant the Gothenburg system to America will require heroic effort. Not only will liquor have to be fought on the social and economic side, but it must also be reckoned with as a political factor. In the latter respect, conditions are going

from bad to worse. Why trifle further? Why not invite the struggle openly on the issue of the only plan of control which eliminates the political influence of the liquor interest, and abolishes altogether the saloon as we know it to-day? If ever municipal politics are permanently purified, it will not be through outbursts of righteous wrath followed by periods of supine indifference. . . . Greater purity in municipal politics, while not an absolute prerequisite, will assuredly follow the introduction of the Gothenburg system.

In many respects the United States offers more favourable conditions for commencing than did Norway and Sweden. No legal obstacles oppose; liquor selling has never been considered a vested interest; nor are we hampered by life-holding privileges. Furthermore, we are accustomed to all sorts of experiments in regulating the trade in alcohol. Not infrequently are prohibition, high license, and low license tried in the same community during the course of a single decade. Climate and custom, too, are in our favour.

AN EXPERIMENT IN SOUTH CAROLINA.

The South Carolina Liquor Law, which came into force on July 1st, is thus described in the September number of the *North American Review* by the Mayor of Aiken, S.C.:—

All parties are prohibited from trafficking in any distilled or malt liquor, while the State is authorised to establish dispensaries for its exclusive sale. A general board of control exercises a supervision over the business, and a chief dispenser receives supplies and fills the orders of the local dispensers in the various counties of the commonwealth. Branch or local dispensaries are established in most of the counties. They remain open from 7 A.M. until 6 P.M. daily, except Sundays and legal holidays. Liquor is sold in packages from one-half pint to five gallons. Beer is also supplied in pint bottles. The labels of most of the bottles are surmounted by the seal and motto of the State, while a palmetto tree in raised surface occupies the reverse side. No liquor is allowed to be sold to minors or habitual drunkards, nor can it be consumed on the premises where it is sold. Any stranger desiring to make a purchase must be identified and vouched for by a responsible person. He then fills out an application, stating his age, residence, the amount he desires to purchase, and the use to which it is to be put. The application being signed and attested by the dispenser or his clerk, the applicant receives the liquor. Distilled liquor can only be purchased once a day by one person, but any number of applications for beer may be made during the day by the same person.

The Mayor, who denounces the measure, admits that "there has been a marked decrease of drunkenness since it went into operation."

An Optimist's View of Cricket.

IN *Cassell's Family Magazine*, Mr. Blathwayt publishes an interview with Mr. Alcock, Secretary of the Surrey Cricket Club, on the subject of "Modern Cricket." Mr. Alcock says:—

It is astonishing how boys are coming forward in modern cricket. We lay great stress in this club on the coaching of our young fellows. The cricket of the future depends on them. In the old days our colts used to be twenty-seven and twenty-eight years of age—now the average would be nearer sixteen. Boys—unless they are at a first-rate public school—are never taught properly, and they get into innumerable bad habits of play, but by the system here of placing promising boys under a regular instructor and showing them the proper style, they learn to play splendidly. In the old days, for want of such a nursery, all our eleven got old at once, and we could not replace it. Now we make the Oval a nursery for the young and promising, and keep our eleven always up to par by continual drafts from this reserve. On the whole, cricket, I consider, is on the upward path most emphatically. I am an optimist where cricket is concerned. I believe in progression, and I am sure we get better every year.

TWO FRENCH POLITICAL ECONOMISTS AND THEIR MAGAZINES.

M. DE MOLINARI.

THE oldest of the French economic reviews is the *Journal des Economistes*, founded in December, 1841. The present editor, M. de Molinari, who reviews the work of the Socialist Congress at Zürich in the September number of his magazine, is well known in this country as a writer on Political Economy. He is also the author of "Religion," and "Précis d'Economie Politique et de Morale." The *Journal*

des Economistes celebrated its fifty years' jubilee by publishing a complete index to its contents for the half century of its existence.

The *Revue Socialiste* appears this month with a mourning border on its cover, for the career of its illustrious chief is over. M. Benoit Malon, who has been an invalid for six months, died on September 13, at the age of fifty-three; but his illness did not cloud his great talent, and he was able to write on till the last. At the time of his death he was engaged on an important work on Socialism.

Benoit Malon, according to the obituary notices—

came to Paris as a lad, and worked as a journeyman dyer. He afterwards directed a co-operative grocery at Puteaux, and began his literary career by writing a few poems full of transcendental Socialism. In 1869 he underwent a term of three months' imprisonment for joining the International. At the Bâle Congress, in the same year, he openly declared himself a Communist. He also shared in the revolutionary attempts of 1867, 1868, and 1869; while the Crensat strike in 1870 again brought him into collision with the Imperial authorities, and on the memorable 4th of September he was amongst those set at liberty amid the popular clamour around the foundation of the Republic.

Benoit Malon's career since then has been marked by political integrity and by faithfulness to principle. On January 22nd, 1871, he joined in the attempted insurrection, and shortly after he was elected one of the Deputies of the Seine Department in the Bordeaux Assembly, but resigned with Henri Rochefort. As a member of the Commune Malon was in favour of conciliation; and when he found that this was out of the question he kept away from the stormy and purposeless sittings at the Hôtel de Ville. When the insurrection was crushed he escaped to Switzerland, where he founded *La Revanche*, which was suppressed in 1872 by the Swiss Government. The amnesty brought the exile back to Paris, and his pen was from that moment devoted to the Apostolate of scientific Socialism by legislation, and above all without revolution. His death is a manifest loss not only for the Socialist party, but for those—and they are many—outside the Socialist camp who were captivated by his theories without being his disciples. His works will remain, but Benoit Malon's place remains vacant. Evolutionary Socialism has no longer any acknowledged exponent in the France of to-day.

A TRIBUTE TO THE DUKE OF SAXE-COBURG.

THE *Gartenlaube*, Heft 10, is the first German magazine to pay its tribute to the memory of the late Duke Ernst of Saxe-Coburg-Gotha. The writer describes as a German prince in the true sense of the word the ruler who has just been taken from his country and the whole German nation, and says his name will figure in the first rank among those who have devoted their best energy to bring about the great changes which have been wrought in the fortunes of the Fatherland during the past half century.

The whole life of the Duke shows how seriously he took his mission—to take his stand among his people, to feel, to care, and to act with them. It was his aim to be at once a prince, a German patriot, and an active citizen of the whole German Empire; and nature provided him with the best gifts for carrying out his ideal. His personal interest in the welfare of his people won their confidence, and they felt that he was a man who would act according to his word. This same personality it was that assured him such success in the great national affairs of Germany. From 1848 the Duke's name was everywhere in things which concerned the free development of the Fatherland.

In the Schleswig-Holstein question, no one felt more keenly the miserable condition of the small States and the want of a united Germany; and no one welcomed more heartily the growing independence of the people which was to make them a political force, and result in 1848 in the National Assembly at Frankfurt, at which all the people were represented. He sought to bring about unity through the princes themselves, and the Princes' Congress at Berlin was due to his efforts. The plan was not successful, so the Duke turned to the German people in general, and to Coburg-Gotha in particular. He also took an active part in founding the National-Verein in 1859, but nothing made him so popular as the institution of the national rifle meetings at Gotha and Frankfurt. The story of the Duke and the wars of 1849, 1866, and 1870 is already too well known to need repetition now.

Nord und Süd for September, which by the way also contains an article on "William Steinway and the Steinway Pianos," publishes a description of the Musical Festival held at Gotha in the last week of July. It is well known that the late Duke of Saxe-Coburg-Gotha was a passionate lover of music, and that he was the composer of several operas—"Casilda," "Santa Chiara," "Diana von Solang-s," and others, besides the "Hymne," which has become the patriotic song of the Duchy. He, too, was the guiding spirit of the Festival which was instituted to resuscitate half-forgotten works and to encourage the composition of new ones. The old works revived were Cherubini's "Médée," and Boieldieu's "Little Red Riding Hood." The new ones were the prize operas, "Evanthia" by Paul Umlauf, and "The Rose of Pontevedra" by Joseph Forster.

British and German Universities.

DR. ALEXANDER TILLE, of Glasgow, is writing on the British and German Universities, in the *Deutsche Revue*. In Part I., which appears in the October number, he describes in outline the various universities of the United Kingdom; in Part II. he will probably do likewise with the German universities, but the subject is too wide for such summary treatment as is meted out to it.

A more interesting article is Dr. Bruno Stübel's "History of the Past of the University of Leipzig," in the *Preussische Jahrbücher* of September.

A LATTER-DAY UTOPIA.

THE SOCIALIST COLONY OF TOPOLOBAMPO.

Not this time in Nowhere, but in Mexico, on the Pacific coast, at the head of the harbour of Topolobampo. There a colony of Americans have settled and for nearly seven years now have been trying to convert the dream of thoroughgoing Socialism into accomplished fact. The story of the experiment is told by Mr. C. M. Harger in *Frank Leslie's Monthly*. The leading promoters were Edward Howland and his sister Marie,—both from New Jersey, students at the Guise "Social Palace" in France,—and a railway surveyor named A. K. Owen. They formed a company with 100,000 ten-dollar shares of stock, each share representing a lot in the site of the city yet to be, and took over quarter a million acres at the spot named above,—a location "alike removed from conflicting legislation and the temptations of surrounding communities of other tastes and practices."

SOCIALISM REALISED.

The company holds all the real estate in perpetuity, selling to its settlers only the right of occupancy. Shares cannot be sold by members except back to the company itself. Officers are elected by vote of stockholders as in any corporation, and all members are to have dealings only with the State. Company scrip, or credits issued for services on the public buildings, canals, etc., forms the currency of the colony, and is exchangeable for shares in the company or their equivalent—perpetual leases of blocks of ground.

A CITY WITHOUT A CHURCH.

The essential feature of it all is that everything shall be pooled and the affairs of all managed by chosen officers as are the affairs of a corporation, and that each shall receive, according to his labours and his investment.

In the original plan even minor details of life were managed by statute. Physicians and lawyers employed on salaries, use of tobacco discouraged, liquors and wines purchased only at the storehouse of the company and exclusively for family use, churches and secret societies forbidden, but freedom of worship allowed among individuals and families, co-operation in cooking, apartment houses and governmental journalism were among the items of the code of regulations. More liberal provisions have since been found advisable. The colonists have been allowed to formulate their own rules in the forum of probably the purest democracy now on earth.

ROUGHING IT.

Fifteen thousand shares having been disposed of, from New York, Pennsylvania, Wisconsin, Michigan and States further west, about four hundred colonists in 1886 first made the long journey to the location of what they hoped to see a model commonwealth. They took with them all their worldly possessions and began life anew.

They had to rough it badly. They arrived at the end of a long drought, and only by hardest labour could they extract subsistence from soil, and river, and sea. The rainy season drenched their ill-roofed homes, and caused the death of one settler.

DESERTERS AND RECRUITS.

But many had gone to the colony who should not have done so. . . About half the party returned home discouraged and disheartened. The remainder stayed by the venture, and for three years, their numbers being increased only by occasional little groups, they worked toward their ideal state.

In the fall of 1890 over two hundred more went to the front, and since then the colony has been swelled, until now five hundred are on the ground, with arrangements made for at least two considerable parties to be added during 1893. It is somewhat remarkable that the proportion of women and children is so large, the men being scarcely more than forty per cent, of the colony's strength. There has never been a

recurrence of the severities of the first year's experience, but the struggle has, nevertheless, been a constant one.

A recently-established system of irrigation has ensured the raising of crops.

THREE DOLLARS A DAY FOR EVERY WORKER.

Throughout the colony's experience the central idea under which it was organised has not been forgotten. Co-operation has ruled. Every pound of grain or fruit raised has been turned into a common fund, presided over by a director. Each labourer—man, woman or child—working on the ditch, on the ranch, or on the truck farm of La Logia, a four-hundred-acre tract near the river, has received payment in company scrip, three "credits," or three dollars a day. The scrip is receivable for material from the company's store-house, which has, by means of the farm's produce, the sale of stock to northern investors and contributions from friends, usually been fairly well filled. From the nature of the case many credits represented work not immediately productive, and could not be at once cashed: but he who laboured has been, at least, fed; and for him who did not there was promised no place.

THE SOCIALIST SUNDAY.

A school with half a hundred bright-eyed lads and lasses, in charge of a teacher who receives the same wages as the labourers on the farm or ditch, cares for the rising generation. Sunday is a day of recreation and relaxation. Regularly on Saturday nights there is a ball in the large company headquarters in the centre of the camp. . . . On Sunday afternoons the people gather, and one of the leaders reads from the lectures of scientists and philosophers, after which comes a general discussion—this usually taking the form of the consideration of ethical subjects.

Practically, there has been only the leadership of brains, all working together as seemed best, and no serious personal disputes have arisen. Co-operation has governed in small things as well as in great. Details from the ranks have done the cooking in the large headquarters building where the unmarried men live. The families live by themselves, and marriages receive the sanction of the director and are then an accomplished fact. The various trades and professions are, of course, not all represented, but such as are possible are found. It can be imagined that there is frequent loneliness especially among the women. The lack of religious feeling, the endless grind for material things, the years of demand for hopefulness upon the spirit of each colonist, have been productive of discouragement for many.

Already a number of English capitalists with socialistic ideas are looking with favour on the experiment, and lend their wealth and influence to its advancement.

"The Patron Saint of New Italy."

GIOSE CARDUCCI is introduced by Mary Hargrave to the readers of *Frank Leslie's Monthly* as "the greatest poet of educated New Italy." He is "essentially a lyric poet," and possessed of a "splendid classical style."

The "short lyric poem of terse and vigorous metre" which made his reputation—the "Inno a Satana":—is not by any means so diabolical as its name would seem to imply. It is simply a hymn in praise of the Genius of Progress or Civilisation, invoked under the name of the angel Lucifer or Satan—the angel who questions, reasons, and rebels. It celebrates the rebellion of reason against ignorance, of enlightenment against darkness and superstition—of course directed against the clerical party.

The poet's panegyrist ventures on a strong statement when she says:—

If Italy were to choose a new patron saint, her choice would undoubtedly fall upon Lucifer, angel of Light, hymned since Carducci's poem in all conceivable ways as symbolising progress and enlightenment.

An extraordinary development of demonolatry, truly.

THE FUTURE OF AGRICULTURE.

CO-OPERATIVE FARMING IN FRANCE.

THE Agricultural Syndicates of France are the theme of a very instructive paper in the *Economic Journal* for September by Mr. H. W. Wolff:—

Of the success generally of the *Syndicats Agricoles* there can be no doubt. Begun most modestly scarcely ten years ago by a handful of agriculturists brought into union by Professor Tanviray of Blois, they have in little time overspread France, multiplying in all to the number of 1,300, with about 600,000 members, and doing an annual business at present of 100,000,000 francs, which promises to grow rapidly to higher figures. They are to be met with in almost every part of France.

The Syndicates help the vine-grower and the sugar-beet grower, the horse-breeder and the market-gardener, they lend a hand in the destruction of obnoxious insects, the embankment of watercourses, fumigation for keeping off the frost, they have even provided French agriculture with Boards of Conciliation and Arbitration, and insurance of labourers against accidents; and, above all things, they have, in M. Gatallier's apt words, wholly "democratised" the use of artificial manures, insecticides, feeding stuffs, etc., placing what was formerly a luxury reserved for the rich within the easy reach of the poor, improving the quality, reducing the market-price by from 20 to 30 per cent., and yet increasing the annual consumption from the paltry figure of 52,000,000 francs, barely more than 2,000,000 for all France—to 120,000,000 francs.

CONSTITUTION: RICH AND POOR CLASSED.

The effort to get rid of the middleman has not, on the whole, succeeded. But—

If co-operative selling has proved a failure, co-operative buying has proved a grand success—indeed, coupled with co-operation in labour, the one success of the movement. That success is really all the more creditable, since the French law of 1884 does not deal over kindly with the syndicates. In France the syndicates must not trade on their own account. . . . The dealer . . . has to collect the money for the collective orders executed from every individual member separately.

The constitution of these associations, which were avowedly promoted in order to "suppress Socialism," varies considerably:—

Most of the *Syndicats* have two classes of members—the rich, who take up heavy shares, must not borrow, and are bound to remain members for a definite time, five years or so, these are the *membres fondateurs*; and the poor, who take up smaller shares, are free to leave, and who may borrow, these are the *membres effectifs*. In one *Syndicat* I have found as many as four distinct orders of members. . . . But it seems to me that the spirit of common interest and common action has been most strongly aroused in the *Syndicats* having only one class of members, all with equal rights and equal obligations, such as that of Auxerre, of which its secretary proudly boasts that "we form a veritable little republic." The members of course elect their officers, and committee, and council, but they elect them as a rule from out of the rich "founder" class. Most of the services are given gratuitously.

WOULD IT DO FOR BRITAIN?

The co-operative purchase and use of machinery and implements, the provision in some districts of winter employment by means of domestic industries, banking and lending, arrangement of technical lectures, provision for analyses and field experiments, prizes for the best managed farms, and subsidies towards the introduction of improved machinery and the construction of liquid manure tanks are among other services rendered by the Syndicates.

Mr. Wolff thinks that we in England do not want them or institutions like them. "Co-operation of a more modest type" is what we need:—

It is strange that our Agriculture should have shown itself so backward in turning to anything like adequate account this powerful force. There is a good deal of agricultural co-operation, no doubt, spread out over the kingdom; but nothing like what the industry wants, nothing like what it readily lends itself to, and what might in trying times to a considerable extent lessen its sufferings and its losses.

Gambling in Farm Produce.

In dealing with the agricultural problem in the same journal, Mr. W. E. Bear observes that—

Perhaps the most striking fact which the new Royal Commission will have to consider is this—that what their predecessors in 1882 declared to be the principal cause of the depression that then existed cannot be considered a cause of the present distress. The seasons for the ten years following 1882, instead of being exceptionally bad, as those of the seventies were rightly declared, were, on the whole, exceptionally favourable. If the yield of all kinds of corn for the decade ending with 1892 could be accurately compared with the corresponding figures for the preceding decade, a great excess would be noticed. The existing crisis of depression cannot be attributed to a succession of bad seasons. There cannot be any question amongst those who understand the circumstances of agriculture that foreign competition is the principal cause of agricultural distress.

One great cause of the intensified depression of the last twelve or fifteen years is branded by Mr. Bear as "gambling in farm produce."

The most important features of the system may be briefly described as the forestalling of the crops by selling them before they are grown; the sale for future delivery of goods which the sellers do not possess, and do not intend to deliver; an enormous amount of reselling, without the transfer of the commodities; rampant speculation; a method of hedging, conducted after the professional betting man's plan of book-making; and the establishment of clearing houses in which a daily or weekly settlement of sums due on variations in prices is effected. This is known as the system of trading in "options" or "futures." It has come into general use in America during the last twenty years, and for the last ten years at least it has completely controlled the market prices in that country. . . . During the last five years the system has become common in Liverpool, and has made some progress in London. The American farmers, almost to a man, denounce it as injurious in the highest degree to their interests, and two Anti-Option Bills have been introduced in the American Legislature to put an end to it. . . . Mr. Stevens, the editor of *Bradstreet's*, in an article in defence of the option system, states in effect that the sales of futures are nine times the total crop.

Character of the Russian Peasant.

MR. FRED WHISHAW contributes to *Temple Bar* a vivid sketch of his observations of village life in Russia. He thus sums up the character of the moujik:—

Easily satisfied, indolent, self-indulgent, weak, he does not care to rise in the world. So long as he can exist and allow his wife and children to exist, and so long as he can obtain for cash or credit, vodka enough to keep him going, he is content. He has no idea of any higher civilisation, or of any sort of home comfort. For the rest he loves his "little Father," the Tsar; fears God in a superstitious sort of way, and the *Lieshwi* (wood spirits) and other supernatural objects of his national folk-lore in a very real way; observes the Church festivals with bibulous piety; attends church at Easter; tolerates his wife, and knows absolutely nothing of the affairs either of this world or of the next. But education is making great strides, and the younger generation is growing up with advantages to which its forefathers were strangers. Light is stealing gradually over the land. Would that it might chase away the drink demon! With the vodka evil reduced to moderate dimensions, there would be a chance even for rural Russia.

ANTI-CHRISTIAN ASPECTS OF THEOSOPHY.

"RECENT Theosophy in its Antagonism to Christianity" is the theme of an essay which Rev. W. J. Lhamon contributes to the current number of the *Andover Review*. He defines recent theosophy as "Blavatskyism," and of Madame herself he exclaims, "strange, strong, erratic creature!"—

Mr. Stead writes admirably of her great characteristics, and marvels at her power over people, instancing the case of Mrs. Besant. He considers it no small thing to have enabled such a woman to entertain any sort of spiritual faith. Misguided, suffering, brilliant Mrs. Besant! The slightest knowledge of her history precludes a single harsh word of her. Yet, speaking both kindly and carefully, one may say that she is by nature an over-enthusiast, and that her brilliancy is not an atonement for her lack of balance.

THREE ANTITHESES.

Theosophy, he avers, is antagonistic to Christianity in three main points.

1. It is pantheistic; although it denies the charge. It rejects the idea of the "God of the Christians." It believes "in a universal Divine principle, the root of all, from which all proceeds, and within which all shall be absorbed at the end of the great cycle of being." It does not believe in prayer: it says "we act instead of talking."

2. It teaches reincarnation: the old Hindu doctrine modified to suit Western taste:—

In a land where lizards and cows are not worshipped it would hardly do to try to proselytize people to the faith that they and their children may be reborn as lizards, cats, or cows. Theosophy confines reincarnation to the human race.

3. It teaches Karma—the negation of forgiveness:—

The theosophists have simply fallen into the old inevitable inconsistency of fatalists, which is unconsciously to recognise human freedom as an agency in human life while theoretically recognising no agency but the dead, unintelligent, ceaselessly grinding mill of cause and effect.

BROTHERHOOD AND CHRIST.

After ridiculing the "miracles" of theosophy and animadverting upon alleged exposures by Coulomb and Kiddle, Mr. Lhamon opposes the theosophic and Christian doctrines of universal brotherhood. He quotes the theosophist Katharine Hillard, to the effect that brotherhood, "as taught by the Churches implies equality, not identity," but in theosophy rests on an "absolute identity."

It is but just to note here that the theosophists do recognise the historical personality of Jesus, but also that they rank him along with Zoroaster, Buddha, Pythagoras, Confucius, Orpheus, and Socrates. . . Christ "as process" means, in the language of "the Higher Alchemy," the redemption of spirit from matter.

THE FINAL TEST.

Mr. Lhamon thus concludes:—

"By their fruits ye shall know them." The last word to be said for theories and institutions must be in praise or blame of what they do for men. Compare India, China, and Japan on the one hand, with Germany, England, and America on the other, remembering where Buddha and Confucius have reigned, and where Christ; remembering also where pantheism and occultism, together with reincarnation and the Karma, have been taught, and where Christian theologies, however erratic and discordant they may have been; then say whether the worst theology is not better than the best theosophy. In this country theosophy is an exotic of the nightshade family, transplanted by erratic hands, and deadly, if entertained intelligently, to our faith in the Theanthropic person of Christ and to our sweet trust in the Fatherhood of God.

SCHOPENHAUER.

By M. VALBERT.

In the *Revue des Deux Mondes* for September 1, M. Valbert presents a striking picture of Schopenhauer, both as a man and a philosopher. His great fame does not seem to have come to him till he was about sixty years of age, when he became the fashion, succeeding Hegel, who at one time had a great vogue. To Frankfurt, where Schopenhauer lived during his later life, strangers came from all parts of Europe to see him, and an audience with the Apostle of Pessimism was greatly prized. The ambition of his admirers was to sit next him at dinner at the *table d'hôte* of the Englischer Hof, the inn where he took his meals; and on his birthday he was as much fêted as a young princess, receiving bouquets of flowers, addresses and tributes in prose and verse, in which some compared him to King Arthur of the Round Table, and others proclaimed him Emperor of German Philosophy. The first time that one of his devotees kissed his hand he uttered an exclamation of surprise, but we are told that he soon became accustomed to this style of homage, and it is recorded that on being informed that a certain country gentleman proposed to build a chapel in which to keep his portrait, the philosopher simply remarked, "This is the first building consecrated to me: how many will there be in the year 2100?" Yet all his contemporaries agree in declaring that he was never happy excepting when he was miserable; but though his disciples have sometimes declared that in order to carry out his own theories he ought to have committed suicide, Schopenhauer, says M. Valbert, was always exceedingly careful of himself, and so far from wishing to destroy his connection with this world, was always wondering what he could do to preserve his life. He left Naples because of the small-pox, Verona because he heard that the tobacco was poisoned, and finally abandoned Berlin to escape from the cholera; for many years he never slept without a loaded pistol under his pillow, and he would never take lodgings higher than the first storey for fear the place should catch fire; while so great was his fear of drinking out of a contaminated glass that he used to carry about with him a small leathern cup in his pocket. M. Valbert informs us significantly that his paternal grandmother was crazy, two of his uncles were lunatics, and his father had been extremely strange. The paternal Schopenhauer had a great affection for everything English, and made up his mind that his son should be born in London. With this object in view he brought his wife to England, but as it was extremely cold and presumably foggy, he hurried her away to Dantzic, which accordingly was honoured by the birth of the great German.

Schopenhauer greatly disliked women, whom he designated as "the animals whose ideas were short, but whose hair was long"; another time he spoke of "that sex with the little waist, narrow shoulders, and large hips"; yet, continues the French writer, he had till the day of his death a pronounced liking for "that sex," and actually left a sum of money in his will to a Berlin actress with whom he had been intimate. As an old man he became attached to a young French sculptress, Elizabeth Ney, who came to Frankfurt and solicited the honour of taking his bust. They lodged in the same house, and used to take long walks together. "I could never have believed," wrote he to his disciple Lindner, "that there was in the whole world so charming a girl." Schopenhauer was very proud of his resemblance to Talleyrand, and liked to pose as being mysterious and incomprehensible to those who came from afar to listen to his conversation.

EMMA SEILER.

SCIENTIST AND MUSICIAN.

In November, 1891, a marble relief-portrait of Emma Seiler was presented by her pupils and friends to the American Philosophical Society at Philadelphia. Mr. J. G. Rosengarten, through whom the presentation was made, also presented to the society, on the part of her son, Dr. Carl Seiler, her laryngoscope, said to be the first ever used in America. Madame Seiler, moreover, was one of the six women thus far admitted to the American Philosophical Society, and this distinction she owed to her earnest and exhaustive study of acoustics and vocal physiology, which resulted in the two works by which she is best known—"The Voice in Singing" and "The Voice in Speaking." *Werner's Magazine* for September contains a sketch of the career of this famous scientist and musician by Mr. F. S. Law.

EARLY LIFE.

Emma Diruff was born in 1821 at Wurtzburg. Her father was Court Physician, and she grew up in close companionship with the children of the royal family. At the age of twenty she was married to Dr. Seiler, and removed with him to Langenthal, near Berne. Several years later, on the loss of his fortune, Dr. Seiler opened a private asylum for the insane, which strongly claimed her sympathies and personal aid. These were still further enlisted by a famine which, in 1847, brought the price of provisions so high that many of the poor died from actual starvation. Deeply moved by such misery and want, and her own circumstances being greatly straitened, she not only begged money and food, but instituted industrial classes, so that her pupils should be enabled to support themselves from the product of their industry. They regarded her as their benefactress, and to this day her name is known and revered among the cottagers of Langenthal.

A STUDENT OF VOICE CULTURE.

In 1851 her domestic misfortunes reached their climax, and she found herself obliged to leave Switzerland, and support herself and her two children. She had always been interested in the voice, and she determined to fit herself for a teacher of singing. She therefore went to Dresden, and placed herself under an eminent instructor in singing, supporting herself by giving piano lessons. At the same time she studied the piano under Friedrich Wieg, the father of Madame Schumann. To her bitter disappointment she lost her voice while under instruction, and this led her to investigate the merits of the different methods of singing, in the hope that she might find some remedy for her loss. Puzzled and baffled by the contradictions and disagreements of the foremost teachers of singing, she came to the conclusion that scientific investigation alone could bring order out of the chaos, and she determined to make it her life-work to discover the correct principles of voice-culture.

ASSISTANT TO PROFESSOR HELMHOLTZ.

After a residence of three years in Dresden, she passed a year with her sister in Breslau, and thence went to Heidelberg, seeking aid from Professor Helmholtz, who was then preparing his great work, "Sensations in Sound." She studied with him the laws which form the basis of musical sound, and in return, through her phenomenally delicate ear, was able to give him great assistance in verifying his experiments. At his suggestion she used the laryngoscope, just invented (1856) by Garcia, to observe the physiological processes which occur in the larynx during the production of tone.

HER DISCOVERIES.

The laryngoscope of those days was but a primitive instrument, but her patience and energy were so great that she persevered in her study until she was able to see clearly the action of the vocal chords throughout the entire extent of her voice. This was a work of years. She threw light on the much vexed question of registers, showing their limits and varying

formation. Her unique discovery of the mechanism of head-tones—the highest tones of the female voice—is an instance of her unflinching patience. She devoted herself to the study of the dissected larynx, and was rewarded by the discovery of two small cuneiform cartilages in the vocal ligaments which produce this peculiar action.

"UNWOMANLY" PURSUITS.

Madame Seiler was, therefore, the pioneer in a field which many others have since explored. She was bent upon studying the dissected larynx, and through a medical student in Heidelberg she procured a throat, which they dissected and studied together. Owing to popular prejudice and to her friends' horror at such pursuits, this could only be done in secret and at night. For the same reason she published her first book anonymously, and not until it had challenged attention and achieved success did she avow its authorship. She used to tell with great glee of her brother, a physician, who came home one day with her book, praising it highly. His mother told him that she knew the author, whereupon he asked eagerly, "Who is it?" When she replied, "Your sister Emma," he could hardly believe her, and threw the book aside impatiently, remarking that his sister would be better employed in attending to her domestic duties than in writing scientific works.

A SCHOOL OF VOCAL ART.

Among her friends in Heidelberg were the two Bunsens statesman and chemist, and Kirchhoff, professor of physics, who with Bunsen the chemist discovered the spectroscope. After living in Heidelberg nearly six years she removed to Leipzig for further study and to educate her children in music. Long before this she had regained her voice, and her studies in acoustics and physiology had given her the knowledge necessary to instruct without fear of injuring the voice. In 1866 she left Germany and came to America, and spent the rest of her life at Philadelphia. In 1867 she published "The Voice in Singing," and in 1873 "The Voice in Speaking." In 1875, at last, she was enabled to found a school for the training of singers and teachers, but after a few years this proved too great a burden for a woman of her age, and in 1883 she sought rest and change in Europe. On her return she lived a retired life till her death in December, 1886. Her name, however will stand for that of a woman who achieved something positive in science in the face of discouragements which might well daunt the most resolute spirit.

The Wagner Question.

The Wagner Society will be delighted with an excellent article by Felix Vogt on Richard Wagner's French Triumph, which appears in Heft 1 of *Vom Fels zum Meer*. The war has been waged in Paris for thirty-two years, for it was in 1861 that "Tannhäuser" was hissed off the stage and in 1893 that "Die Walküre" was received with the greatest enthusiasm. Portraits of Jules Padeloup, Edouard Colonne, and Charles Lamoureux accompany the article.

The Art of Richard Wagner is the subject of a short but interesting paper *à propos* of a book by Alfred Ernst. It is written by George Vanor and appears in *Entretiens Politiques et Littéraires* of September 10.

In the *Young Man* for October, Mr. Haweis gives, under the title "Men I have Met," some interesting personal reminiscences of Wagner. It is curious to learn that Wagner thought "Die Meistersinger" most suited to the English. Wagner's conducting at the Albert Hall was much criticised; but it was a revelation to Mr. Haweis. At times he did not conduct at all; he let the band alone as though he inspired instead of drove them.

Mr. William Ashton Ellis continues the periodical publication of what many think the most interesting of the Wagner literature of to-day—his excellent translation into English of "Wagner's Prose Works."

CHURCH VIEW OF THE PARISH COUNCILS BILL.

THE first place in the *Newbury House Magazine* is given to an analysis and a criticism of "The Local Government Bill, 1893," by Rev. T. W. Belcher, D.D. His general standpoint appears in the words:—

The Bill ought not to be opposed but amended. . . Let us separate matters which have been cunningly or ignorantly worked into the Bill so as to injure the poor and rob the Church, and let the measure stand naked on its own feet without our opposition to its alleged principle, which most of us will support. . . It must be admitted that the old parish vestry system . . . needs reform. We live, not in the eighteenth, but at the close of the nineteenth century, and wise men will assist this proposed parish reform. They will do this by divesting it of a party or vote-catching character, by giving plenty of time for its consideration, and by endeavouring to have it amended and passed by consent so that it may be useful and permanent.

SUGGESTED AMENDMENTS.

The Bill extinguishes all parishes having less than 300 inhabitants each—nearly 7,000 out of the 13,000 rural parishes. This measure Dr. Belcher strongly opposes.

No person should be a Parish or District Councillor who cannot read or write. The want of provision for this in the Bill gives it a very illiberal and retrograde character.

Dr. Belcher strongly objects to the provision that no man can be a Councillor who within twelve months of the election has received "alms," a term which legally includes money from the church offertory for the poor. A parishioner helped in sickness or other unforeseen trouble by offertory alms is, no matter how thrifty, "classed with felons and other criminals" as unfit to represent his parish! Dr. Belcher also objects that "apparently, neither Chairman nor Councillor need ever have seen the parish for which and by which they are elected."

The District Council should be dispensed with. The parish as the unit, with the County Council immediately above it, is sufficient.

Justices of the Peace at present *ex officio* Guardians of the Poor should be retained in that capacity, "so long as they attend with fair regularity, leaving to newly appointed magistrates the disqualification proposed in this Bill."

Poor-Law Guardians should be resident in or within a certain distance of the parishes which they represent.

Different areas, *e.g.*, for School Boards and Sanitary Districts, . . . ought to be abolished, and the parochial area should be the same for all. . . School Boards and Burial Boards, and all other parochial Boards, ought to be merged in the Parish Councils, which ought to do the duty of School Attendance Committees.

There should be but one rating authority for a parish instead of several—twelve at present. Any additional rating by Parish Councils beyond what is now lawful should be on the principle of Sec. 230 of the Public Health Act of 1875, under which expenditure intended chiefly for the benefit of householders and house property, should chiefly fall on houses.

Compounding for rates in the case of small tenements ought to be abolished, so that everyone who can vote shall feel that he is a ratepayer. A budget of probable expenses ought to be published at the beginning of each official year, and accounts ought to be audited in or near each parish, in such manner as that ratepayers can attend.

The provision which obliges parish and council meetings to be held after six p.m. excites Dr. Belcher's mingled wrath and pity.

The use by meeting and Council of school-houses where the school receives a grant from the Education Department is warmly opposed:—

In fairness, if these buildings are to be used for parish purposes, then such use should be in school hours, and the

school should get credit for it, as in the case of an M.P. election. . . . If parish meetings be held in Church school-houses on Saturday nights, the Sunday-school must go to the wall next day.

Parish-rooms, mission-rooms, school-houses, and all such Church property vested in trust with Overseers and Churchwardens will—it is alleged—be given to the Parish Council. This is said to be denied by the Law Officers of the Crown. If their opinion is to be accepted it ought to be visible and intelligible in the Bill.

If the Vestry is to remain for Church purposes alone, then it should be a Vestry of Churchmen only. The Vestry system for new ecclesiastical parishes, with a few modifications, will answer this end. The ratepayer qualification for voting there ought to be abolished.

Where churchwardens are trustees for anything as Church officers they ought to be so continued. The expression "Affairs of the Church" should be defined. School-houses and parish rooms ought to be expressly exempted from confiscation.

"Ecclesiastical Charities" should be defined so as to include gifts intended by the donors to be given through the Church as a matter of Christian duty. . . . The attempt of this Bill to cut off the ministry of the Church to the poor by robbing the poor is only the prelude to the next step which will attempt to cut off the ministry of the Church altogether by robbing Her provision of the clergy. . . . No deserving poor man will make a Parish Council his father confessor.

Dr. Belcher, who urges "let there be no party politics in the matter; let the Church trust Herself and distrust party politicians," concludes with the hope "that the Primate will rouse the Church as he did about the Welsh Suspensory Bill, and help Mr. Fowler to give Churchmen what we mean to have—fair play."

MR. FROUDE'S DEFENCE OF DRAKE'S "PIRACIES."

THE story of "Drake's Voyage Round the World," and his daring captures of Spanish treasure, is told in *Longman's* with all the vividness and brilliance of Mr. Froude's narrative genius. It is the last of four lectures on "English Seamen in the Sixteenth Century." The lecturer says he looks forward to the time when "what we owe" to the Reformation "and these sea-captains of Elizabeth will form the subject of a great English national epic as grand as the *Odyssey*." Of the ethics of their conduct he speaks thus:—

Resolution, daring, professional skill, all historians allow to these men; but, like Burghley, they regard what they did as piracy, not much better, if at all better, than the later exploits of Morgan and Kidd. . . . In that intensely serious century men were more occupied with the realities than the forms of things. By encouraging rebellion in England and Ireland, by burning so many scores of poor English seamen and merchants in fools' coats at Seville, the King of Spain had given Elizabeth a hundred occasions for declaring war against him. Situated as she was, with so many disaffected Catholic subjects, she could not begin a war on such a quarrel. She had to use such resources as she had, and of these resources the best was a splendid race of men, who were not afraid to do for her at their own risk what commissioned officers would and might have justly done had formal war been declared; men who defeated the national enemy with materials conquered from himself, who were devoted enough to dispense with the personal security which the sovereign's commission would have extended to prisoners of war, and face the certainty of being hanged if they were taken. Yes; no doubt by the letter of the law of nations Drake and Hawkins were corsairs of the same stuff as Ulysses, as the rovers of Norway. But the common sense of Europe saw through the form to the substance which lay below it, and the instinct of their countrymen gave them a place among the fighting heroes of England, from which I do not think they will be deposed by the eventual verdict of history.

MR. HAMO THORNYCROFT, R.A.

THIS eminent sculptor is the subject of the Illustrated Interview in the September *Strand*. It appears that he belongs to the third generation of a family of sculptors. His grandfather went to see Nelson's funeral. The wonderful car impressed him. As soon as he returned to Norfolk he went along the seashore, picked up the jet, and carved a model of the car. "Mr. Vernon saw it, and immediately sent him to Chantrey's studio." So sculpture came into the family. The grandmother, however, is described as "a North country woman, a great Puritan, and never tired of dilating upon the wickedness of sculpture, as it tended to be Popish." Her son, however, was a votary of the art, and, what is more, took a sculptress for his wife.

SCULPTURE IN THE BLOOD.

The mother of the Royal Academician was a pupil in the grandfather's studio, and her "Skipping Girl" is said to be one of the six best modern statues in Europe. Born of such parents, Mr. Thornycroft's genius is in some measure explicable. He tells the interviewer:—

There were seven of us. I was considered the one too many, so I was sent off to an uncle, who was a farmer in Cheshire, at the age of four. You see, I was bred almost in the open, and from this I believe my intense love for natural history sprang.

His father had decided to make him an engineer, but a chance purchase of Flaxman's Homer discovered in him the artist. He quietly went to work in the British Museum and his father's studio, and won a studentship at the Royal Academy. So he was launched on his career. His first great public statue—a commission from the Government—was that of General Gordon, which now stands in Trafalgar Square. It took him two and a half years to produce. Singularly enough he had never seen Gordon. He read up as many lives of Gordon as he could, studied his photographs, and so conceived the hero. How the commission to execute a statue of the late Lord Granville is being carried out is instructively told.

HOW A STATUE IS PRODUCED.

The sculptor himself makes the tiny sketch model in green wax, and a quarter size model in plaster. From these the pupils and assistants build up the statue in clay to full size, which then comes under the master's hand. It is next copied in marble. "Great blocks of marble are resting against the wall. One fine and pure piece is pointed out as weighing six tons. It cost £200. Granville is inside! A workman is sawing away at a huge piece of the product of Carrara." The chips of marble are carefully removed for use in aerated water manufacture, to be converted ultimately into the gas of the soda water! It is curious to learn that even of a dead man "the sculptor is provided with every item of clothing when it is possible—the hat particularly, as it is an excellent guide to the size of a man's head."

Mr. Thornycroft possesses a remarkable "family hearth," each tile of which bears the features of a member of the family. It was the work of Miss Helen Thornycroft. He believes the future of sculpture in this country is assured,—but in bronze,—our climate being unsuited to marble.

A WIDOW lady of my acquaintance, living in her well-appointed home in North-Western London, would be pleased to undertake the charge of an elderly invalid gentleman. Every home comfort and kind attention.—For terms, etc., address, "Widow," REVIEW OF REVIEWS Office, London.

THE RELIGION OF ZOROASTER.

THE *Asiatic Quarterly Review* contains a valuable analysis by General Forlong of the Pahlavi Texts, Part IV., which have been added to the "Sacred Books of the East" series. From this it appears that

we may reasonably accept the well-informed and studied conclusions of *Āvastian* scholars, beginning with Professor Hanz, that the prophet lived between the twentieth and eighteenth centuries B.C., and that his principal teachings—the *Āvasta* or "Laws" of *Ahura-Mazda*—were embodied with *Zand* or "Commentaries" about the seventeenth century B.C., when the Reformed Faith took effect under King Vishtāp.

The Texts under review are a "popular summary" of these teachings, from an edition of date 880 B.C., about two generations before Amos, the Hebrew prophet. They contain a "mass of weary platitudes" and wordy casuistry: but—

There is also here in abundance the highest ethical and wise teaching by writers of marked piety, goodness, and genius: men who are keen and grievously moved by the sins and sorrows, worries and miseries of their fellows, and who are profoundly anxious to alleviate these and to lead all men into paths of holiness and peace, by the doing of justice, the love of mercy, righteousness, and truth; and as they add, "looking always to and walking humbly before their God"—*Ahura-mazda*, no mean God-idea.

THE TRINITY OF RIGHTEOUSNESS.

The Texts continually and piously counsel us regarding "the peace which follows the renunciation of sin." . . . There is scarcely a conceivable situation of life public or strictly private, from that of the King on his throne, the Judge on the bench, the maiden or wife in her chamber, the herdsman and his dog on the hillside, which is not here dwelt upon by these laborious and experienced old writers; and the burden of their teaching is the *Ashem Vohū* or "praise of Righteousness," as that which alone exalteth the individual and the nation. Righteousness alone maketh they say "a perfect character . . . it alone is the perfection of religion," and is summed up in the three words which ought to be ever on our lips and in our hearts—*Hūmat, Hūkt, and Hūrat*, GOOD THOUGHTS, GOOD WORDS, AND GOOD DEEDS.

SIN AND HELL.

If we would avoid sin let us begin inwardly by subduing evil thoughts, and outwardly by avoiding evil company, and all first promptings to sin. A-Niyada sees the heart and our hidden springs of action. . . . We are cautioned to beware "of seductively assuming religion, colouring thought (i.e., canting?), talking and reciting hypocritically of righteousness whilst adopting evil practices."

In hell, the souls stand so thickly about, that they cannot see each other (elsewhere it is said to be "the blackness of darkness"), and they all think they stand alone. Though there is weeping and wailing, no voice is heard, but there are noxious smells, though it freezes, here, so different to our Gehenna.

In the *Modern Review* for this month Lady Florence Dixie tells an astonishing story of how a wealthy gentleman offered her £135,000 to establish a morning half-penny newspaper which was to be devoted to the interests of women. When, however, he insisted that she was to devote a certain proportion of the paper to fashion and dress, Lady Florence rebelled, and saying to him in effect, "Thy money perish with thee!" refused to have anything more to do with the scheme. She is, however, thinking of starting a paper on her own account without his aid.

BOOKS MOST READ IN MASSACHUSETTS.

MR. C. B. TILLINGHAST tells the readers of the September *Forum* many interesting facts ascertained by the Massachusetts Free Public Library Commission, of which he is chairman, and which principally busied itself with the needs of the rural communities. It appears that the libraries are almost exclusively used by young people. Bound volumes of illustrated magazines and the higher grade of reviews are in constant and increasing demand:—

The most popular book in our libraries to-day is "Uncle Tom's Cabin." It is still read in all our communities by people of all ages and classes and all nationalities. Wherever lists of books having the widest circulation are kept, this book usually heads them. "Ben Hur" retains a remarkable fascination for the reader. "Lorna Doone" and the novels of William Black, among the books by modern authors, have a large circulation. The "Scarlet Letter" and the "Marble Faun" stand high on the record of books most circulated. Some of the stories which delighted the readers of a generation ago, like "The Lamplighter," "Queechy," and "The Wide, Wide World," seem to have a perennial vitality, and are much read to-day, while some of the books whose titles are most familiar to the modern ear, like "Looking Backward" and "Robert Elsmere," after a wonderful run for a time soon drop out of the list of those widely called for. The steady demand for "Ivanhoe" and others of Scott's novels proves their undying charm; and it appears to be a fact that the number of those who read Scott is increasing, while the number of the readers of Dickens is diminishing. In the reference department of our libraries the most noteworthy of modern developments is the growing use which is made of works upon the fine arts, especially architecture. . . . Biography, especially autobiography . . . rivals the novel in popularity. The "Personal Memoirs of General Grant" . . . is still in constant demand. . . . The dry details of ancient and mediæval history are not so much read as they were a quarter of a century ago. . . . Readers at large are more interested in the present condition of a country, its resources, its people, and the habits and customs of their daily life. . . . Books which tell in simple untechnical language the story of birds, animals and plants, and other natural objects . . . are coming into more general use. . . . The good old classics of English literature, while the lighter form still retains some hold upon the general reading public, are not so widely read as they were a generation ago. Graces of style do not appear to have the charm for the present that they exercised over the preceding generation.

In Massachusetts the Free Library idea seems to be very thoroughly carried out:—

The State is divided into 352 local autonomies, and its population in 1890 was 2,238,913. There are libraries from which the people are entitled to take books for home-reading, free of all expense, in 305 of these towns and cities, which embrace more than ninety-seven per cent. of the population. The aggregate number of volumes in the libraries is two-and-three-quarter millions, and the circulation for home use is five million volumes per annum—more than two volumes to every man, woman and child in the State.

OUR REBEL INDIAN GOVERNMENT.

THE deliberate defiance of Imperial Parliament by its subordinates in India seems likely to re-open the whole question of the methods of governing our vast Eastern dependency. It forms the occasion of a curious unsigned article in *Macmillan's*. The author is a thorough-going apologist for the Indian mutineers. He deplores the disturbing "influence of fanatics and doctrinaires" in the House of Commons. It is this influence, he says, which has prompted the recent proceedings of Parliament in connection with the Cantonment Regulations, the Excise Administration, the Opium Trade, and the Indian Civil Service:—

The resolutions have been passed without the least attempt to consider each question in all its bearings, and to estimate the consequences of adopting a new policy. Members have voted for the resolutions on account of the urgency and opportunity of certain small but very ardent sections of the electorate, the rest of the electorate being entirely passive on the questions.

He admits the disobedience of the Indian Government in all four cases, and tries to justify it. "When the Government of India found, as they did in the present instance"—the repeal of the C. D. Acts—

that obedience to the House of Commons, without relieving them of a rupee of expense, practically deprived them of (say) the equivalent of two British regiments out of their effective garrison in India, was it surprising that they sought some way of escaping the consequences of obedience?

He quotes from a Bombay newspaper, that "the spirit of the orders of Parliament was evaded, but the military authorities, much less His Excellency the Viceroy, are nowise responsible." "Who then," he asks, "is responsible?" and coolly answers, "But that is another story." It is a story which will have to be told out some day—with consequences. The writer proceeds:—

But if the House of Commons passes resolutions in regard to Indian administration, and the Government of India refused to act upon them, it is clear that matters are coming to a deadlock. It is quite certain that the House of Commons will not allow its authority to be so ignored, particularly by a body such as the Government of India, which at the best of times it looks upon with little favour. What is the remedy? The remedy which has been resorted to in the present difficulties . . . is the appointment of Special Commissions to report after examination of all sides of the question.

This remedy is dismissed as "hardly adequate." So is the proposal to institute periodical Parliamentary inquiries into Indian administration. A sketch of the history of the Council for India leads up to the suggestion:—

Is it beyond hope that the India Council should be reconstituted in a manner that would give it independent authority and secure to it public confidence for the solution of all these thorny questions?

National Federation of Labour.

MR. CLEM EDWARDS, in the *Economic Journal*, continues his valuable history of Labour Federations. "The first effective effort to form a labour federation of any magnitude in this country," was that made in 1830, when the "National Association for the Protection of Labour" was brought into existence. This association appears to have embraced no fewer than 150 separate unions. This was superseded by the "Grand National Consolidated Trades Union," which collapsed in 1836. In 1845 the "National Association of United Trades" was formed, after a period of depressed vitality was revived in 1851, only to fall through in 1861. In 1865 the "United Kingdom Alliance of Organized Trades" was born, only to die two years later, its treasurer being implicated in the notorious trade outrages at Sheffield. Other attempts at making British labour "solid" have been discussed by the Trades Union Congress, but without organized result. Federation has not gone further than local Trades Councils, or than national or international organization of particular and kindred trades:—

An interesting proposal, which appears to be growing in favour, was recently submitted by Mr. Joliffe to the Bristol Trades Council regarding the Parliamentary Committee of the Trade Union Congress. He proposed that the committee should form a federal link between trades councils. He suggested that it should be endowed with executive powers, and that it should have a clearly defined relationship to the trades councils and trades unions of the country.

NAPOLÉON'S VOYAGE TO ST. HELENA.

WHILE the *Northumberland* was conveying the captive Emperor to his island prison, the Secretary of the Admiral, John R. Glouer by name, was careful to keep a diary of all that he observed Napoleon do or say. This historical treasure has lain in manuscript for seventy-eight years, and is only published now for the first time. The first instalment appears in this month's *Century*. The Secretary was a man who used his eyes and ears well, and though he occasionally indulges in edifying reflections, he gives on the whole a vivid picture of the great prisoner's life on board. His record is almost microscopic in its detail.

HIS FLEXIBILITY OF MIND.

What seems to have first chiefly impressed him was the promptitude with which Napoleon accommodated himself to his changed fortunes and his immediate environment:—

This man, who but a short time since kept nations in dread, and had thousands at his nod, has descended from the emperor to the general with a flexibility of mind more easily to be imagined than described. He is henceforth to be styled general, and by directions from our Government he is to have the same honours and respect paid him as a British general not in employ.

Yet the ex-emperor did not always conceal his sensitiveness to altered circumstances. On the third day, after dinner he—

went on deck, where he walked, keeping his hat off and looking round steadfastly and rather sternly to see if the British officers did the same. Not a British head was uncovered, at which he was evidently piqued, and soon retired to the after cabin. His followers were constantly uncovered in his presence.

HIS TABLE-MANNERS.

According to present-day standards, General Bonaparte was singularly deficient in some rudiments of table-manners. We are told that he—

ate of every dish at table, using his fingers instead of a fork, seeming to prefer the rich dishes to the plain dressed food, and not even tasting vegetables. Claret was his beverage, which he drank out of a tumbler, keeping the bottle before him.

The great host of men and women who are ashamed to confess that they are "not good sailors" will probably feel a ripple of satisfaction on learning that the man who kept the world in awe was not exempt from the general infirmity of landsfolk.

Owing to the swell and consequent motion, but few of our guests were able to come to table, and the General did not make his appearance during the day.

Nor was this the only occasion when Napoleon succumbed. He usually passed the day in fine weather thus:—]

He breakfasted in his cabin. He walked the deck both before and after dinner, and spent the evening playing at ring-un.

He was evidently great at cards. He and his party were amused at the secretary's surprise on their wanting to play cards on Sunday.

HIS CONVERSATION.

Napoleon seems to have talked freely with whomsoever he met, and it is interesting to notice how he made it a point to draw people out. He talked to them about what they were interested in, even putting the worthy chaplain through a lengthy catechism on Church forms and creeds in England, differences from Continental Churches, number of dissenting sects—"in fact, he asked almost every possible question."

His reported conversations show great frankness about

himself. He confessed his designs on England, explained the "inside track" of a good deal of history then recent, and generally would have supplied the modern interviewer with whole reams of gorgeous "copy." The story of the Jaffa poisonings he disposed of evidently to the satisfaction of the secretary. He attributed his defeat at Waterloo to the disaffection of his officers who were secretly supporters of Louis XVIII.

HOW HE CAME TO RE-MARRY.

He thus described the steps that led to his divorce and re-marriage. He said that

when at Erfurth, the Emperor Alexander took an opportunity one day of pressing upon him how important his having a legitimate heir must prove to the future repose of France and Europe, and Alexander therefore advised his setting aside Josephine, to which if he would consent the emperor offered him in marriage a Russian princess (he believed Princess Anne was named). But Bonaparte said he did not at the moment pay much attention; for, having lived so long with Josephine in such harmony, and having so much reason to be satisfied with her, the idea of causing her pain disinclined him from entering further on the subject; added to which, he said he was already well aware of the falseness of the character of the Emperor Alexander. He therefore merely observed in reply that as he was living on the best possible terms with Josephine, he had never even thought of an arrangement of the nature mentioned by his imperial majesty. However, some time after, when at Paris, being strongly urged by his own friends on the same point, and Josephine having herself assented, he sent to Russia to acquaint Alexander of his wish and readiness to espouse the Russian princess who had been proffered him when at Erfurth.

But the Tsar, while assenting, made difficulties; knowing which—

some of his ministers, with Beauharnais, his son-in-law [*sic*], waited on him and pressed the advantage which might result should he consent to ask in marriage an Austrian princess, adding that the Austrian ambassador would readily engage for his court coming into any arrangement he (Bonaparte) might wish for this object. To which he replied, if such was the case, and the affair could be concluded at once, he should not on his part make objections to this new plan.

A curious glimpse of the terror which Napoleon inspired is furnished when the ship was lying off Madeira:—

We had a continuation of the violent and most disagreeable siroc wind, which commenced on our first making the island; and such was the superstition of the inhabitants, that they attributed this destructive siroc to Bonaparte being off the island, and were extremely apprehensive that their crops, which were nearly ripe, would be more than half destroyed.

Are Animals Immortal?

EMPHATICALLY yes! answers Mr. Josiah Oldfield in the *Humanitarian*. This is his case for "the continuity of all life":—

If the inexplicable sufferings of man, the inequality of terrible burdens, form a logical argument for a future life in his case, why should it not do the same in the case of animals, who suffer just as unequally, just as inexplicably, just as terribly, as man suffers? May we not conclude that in God's hand there is a salve for every wound of theirs, too; a crown for every cross of theirs, too; a recompense of life for every broken heart among them? The same thing occurs in animal life as in human life. The Gelert, who saves the child by fighting with the wolf, is killed by his master in the sudden anger of an irrevocable mistake. The great St. Bernard, braving the bitter frost to save a wayfaring stranger, is dashed over a precipice by a block of ice, and is broken into a thousand pieces. The brave Newfoundland leaps into the stormy waves to save the drowning child, and sinks exhausted, beaten helpless against a rock. . . . The argument is the same; the premises are the same; the conclusion is the same.

WALT WHITMAN'S WAR LETTERS.

A VOLUME of "Hospital Letters" (written during the Civil War) which is in course of preparation by Whitman's literary executors has been tapped by the *Century*, and the first batch selected appear this month. They make delightful reading. They are addressed to members of the poet's family,—chiefly to his mother; and are written in the most artless and simple style. They suggest something of a child's absence of self-consciousness. They thus furnish fresh insight into the heart of the man. His warm-hearted love as son and as brother makes only the more impressive his service of the sick and wounded soldiers. The editors have wisely let the letters stand as they were written, without trimming them to suit conventional grammar and punctuation.

This is how the grandeur of the Capitol impressed him:—

I spent several hours in the Capitol the other day—the incredible gorgeousness of some of the rooms (interior decorations, &c.). . . . But a few of the rooms are enough for me—the style is without grandeur, and without simplicity—These days, the state our country is in, and especially filled as I am from top to toe of late with scenes and thoughts of the hospitals (America seems to me now, though only in her youth, but brought already here feeble, bandaged and bloody in hospital), THESE DAYS, I say, Jeff, all the poppy-show goddesses, and all the pretty blue & gold in which the interior Capitol is got up, seem to me out of place beyond anything I could tell—and I get away from it as quick as I can when that kind of thought comes over me.

HIS HOSPITAL WORK.

Of his work in the hospitals, at which he did not miss a day for three weeks at a time, the following is a touching picture:—

They have great camps here in every direction, of army wagons, teamsters, ambulance camps, &c. Some of them are permanent, & have small hospitals—I go to them (as no one else goes, ladies would not venture)—I sometimes have the luck to give some of the drivers a great deal of comfort & help—Indeed mother there are camps here of everything—I went once or twice to the contraband camp, to the Hospital, &c., but I could not bring myself to go again—when I meet black men or boys among my own hospitals, I use them kindly, give them something &c. I believe I told you that I do the same to the wounded rebels, too—but as there is a limit to one's sinews & endurance & sympathies &c. I have got in the way after going lightly as it were all through the wards of a hospital, & trying to give a word of cheer, if nothing else, to every one, then confining my special attentions to the few where the investment seems to tell best, & who want it most—Mother I have real pride in telling you that I have the consciousness of saving quite a number of lives by saving them from giving up, and being a good deal with them—the men say it is so, & the doctors say it is so—and I will candidly confess I can see it is true, though I say it of myself—I know you will like to hear it mother, so I tell you . . .

WHAT HE THOUGHT OF WAR.

In the hospitals among these American soldiers from East and West, North and South, I could not describe to you what mutual attachments, passing deep and tender. Some have died but the love for them lives as long as I draw breath. These soldiers know how to love too, when once they have the right person. It is wonderful. . . . It is dreadful when one thinks about it—I sometimes think over the sights I have myself seen, the arrival of the wounded after a battle, & the scenes on the field, too, I can hardly believe my own recollection—what an awful thing war is—Mother it seems not men but a lot of devils & butchers butchering each other. . . .

Writing April 5, 1864, he says:—

Well mother I went to see the great spirit medium Foster—there were some little things some might call curious perhaps, but it is a shallow thing and a humbug—A gentleman

who was with me was somewhat impressed, but I could not see anything in it worth calling supernatural—I wouldn't turn on my heel to go again and see such things, or twice as much—we had table rappings and lots of nonsense. . . .

O I must tell you I gave the boys in the Carver hospital a great treat of ice cream, a couple of days ago, went round myself through about 15 large wards (I bought some ten gallons very nice)—you would have cried & been amused too, many of the men had to be fed, several of them I saw cannot probably live, yet they quite enjoyed it, I gave everybody some—quite a number of western county boys had never tasted ice cream before—they relish such things, oranges, lemons, &c.—Mother I feel a little blue this morning, as two young men I knew very well have just died, one died last night, & the other about half an hour before I went to the hospital, I did not anticipate the death of either of them, each was a very, very sad case so young.

CAN THE HOUSE OF COMMONS BE SAVED?

THIS is the question which Mr. Harold Spender discusses, with admirable insight, in the *New Review*. He has little complaint to make of the *personnel* of the Commons. "Perhaps," he says, "it has never been higher than in the present assembly. But though the *personnel* is going up, the procedure lags behind." In seeking an explanation, Mr. Spender calls attention to a most important truth, and one which goes far to explain a great many of our difficulties outside as well as in Parliament. Democracy has, until very recently, been continually in opposition. That it is now in power is a fact which it has not yet assimilated:—

The House of Commons has been stereotyped as a machine of protest, and the difficulty of the present situation is that it has little or nothing left to protest against. . . . Wherever it takes up the reins of government, it is hampered on every hand by the code of opposition ethics that it inherits—the dogmas of rebellion and the doctrines of popular combat that have almost elevated themselves into a positive system of philosophy. . . . Democracy must set about organising itself, and putting its house in order. It must develop a doctrine of duties; it must give efficient power to majorities; it must limit the liberty of rebellion.

The worst of it is that the House does not seem to be aware of the evil:—

Excepting a few young members, who, not yet subjected to tribal influence, feel a probably transitory spirit of revolt against a cumbrous and artificial system which they do not yet fully understand, the greater number of our legislators are perfectly content with things as they are. The plain fact is that the purpose of making laws is the last purpose in the mind of the average Member of Parliament. He goes there to win victories on a large scale—for his party and himself. What he chiefly wants is a stage—an arena.

Mr. Spender's principal proposals we may thus summarise:—

(1) Diminish the number of members, in which we now far exceed all other European legislatures. (2) Let the House sit shorter hours and work harder. (3) Give the private member in Committees some share in administration, and so extend the pitifully narrow area of expert knowledge in Executive affairs. (4) Delegate Supply to Committees—the Report stage in the whole House ensuring all that is now ensured. (5) Rationalise the closure by fixing a time limit to (a) every clause, and (b) every speech, allowing members to borrow time from fellow-members.

But what we primarily want among our leaders on both sides is a feeling of the crisis through which democratic government is passing. In one sense it is perfectly true that representative government is on its trial. It is on its trial as a controller of the Executive. Representative government as a mode of legislation is a permanent form of human government.

THE REIGN OF THE MAGAZINE.

MR. W. D. HOWELLS contributes to *Scribner* a delightful paper on "The Man of Letters as a Man of Business." He begins by suggesting that "business is the opprobrium of literature. No man ought to live by an art." A special interest attaches to his estimate of the part the magazine has taken in the development of an American literary class:—

I may say that it is only since the war that literature has become a business with us. . . . Many authors live now, and live prettily enough, by the sale of the serial publication of their writings to the magazines. . . . Their incomes are mainly from serial publication in the different magazines; and the prosperity of the magazines has given a whole class existence which, as a class, was wholly unknown among us before the war. . . . The better recognised authors do get reprinted. . . . But he understands perfectly well that his reward is in the serial and not in the book; the return from that he may count as so much money found in the road—a few hundreds, a very few thousands, at the most.

THE AVENUE TO FAME.

In belles-lettres, at least, most of the best literature now first sees the light in the magazines, and most of the second best appears first in book form. . . . All this may change again, but at present the magazines—we have no longer any reviews—form the most direct approach to that part of our reading public which likes the highest things in literary art.

An interesting proof of the value of the magazine to literature is the fact that a good novel will have wider acceptance as a book from having been a magazine serial.

SCALE OF PAY.

They pay very well indeed for literature; they pay from five or six dollars a thousand words for the work of the unknown writer, to a hundred and fifty dollars a thousand words for that of the most famous, or the most popular, if there is a difference between fame and popularity. . . . Usually, the price is so much a thousand words, a truly odious method of computing literary value, and one well calculated to make the author feel keenly the hatefulness of selling his art at all. It is as if a painter sold his picture at so much a square inch, or a sculptor bargained away a group of statuary by the pound.

Passing to treat of books, Mr. Howells remarks:—

It is not common, I think, in this country, to publish on the half-profits system, but it is very common in England, where, owing probably to the moisture of the air, which lends a fairy outline to every prospect, it seems to be peculiarly alluring. One of my own early books was published there on these terms, which I accepted with the insensate joy of the young author in getting any terms from a publisher.

Every copy was sold, and he received as his share eleven shillings and ninepence!

WOMEN ARBITERS OF THE FATE OF BOOKS.

To aim a book at the public favour is the most hopeless of all endeavours, as it is one of the unworthiest; and I can, neither as a man of letters nor as a man of business, counsel the young author to do it. The best that you can do is to write the book that it gives you the most pleasure to write, to put as much heart and soul as you have about you into it, and then hope as hard as you can to reach the heart and soul of the great multitude of your fellow-men.

The man of letters must make up his mind that in the United States the fate of a book is in the hands of the women. It is the women with us who have the most leisure, and they read the most books. They are far better educated, for the most part, than our men, and their tastes, if not their minds, are more cultivated. Our men read the newspapers, but our women read the books: the more refined among them read the magazines.

I think it is pretty certain that fewer and fewer authors are turning from journalism to literature, though the *entente cordiale* between the two professions seems as great as ever. . . .

To put it coarsely, brutally, I do not suppose that any other business receives so much gratuitous advertising, except the theatre. . . . A curious fact, however, is that this vast newspaper publicity seems to have very little to do with an author's popularity, though ever so much with his notoriety.

Mr. Howells concludes that the man of letters is an artist, "economically the same as mechanics, farmer, day labourers."

THE COW RIOTS IN INDIA.

MR. G. W. LEITNER writes in the *Asiatic Quarterly Review* to show that the slaughter of the cow, which is now setting Hindu and Moslem by the ears, is not required from the Moslem at his annual festival commemorative of Abraham's readiness to offer up Ishmael. The Koran only speaks of the substitution of "a noble victim," which the earliest commentators explained to mean "a ram." The feast is called in India Baqr-I'd:—

The Hindustani name for goat is "Bakra," but the "K" is a "Kef," whereas the "K" in the Arabic word "Baqr" or "Bakr" is a "qaf," but it makes all the difference to the peace of India if the "Bakra-I'd" is with a "Kef" or a "qaf." If it be, as the vulgar calls it, and it is in general practice: "a sacrifice of goats" or = "Bakre-ka-I'd" or even "Bakra-I'd," the contention between Hindus and Muhammadans is at an end, but if, as mischief-makers have invented, "Baqr-I'd" is a festival of the sacrifice of a cow, then the *Pax Britannica* may at any moment give way to an universal rising among Hindus throughout India. It is, therefore, the most elementary common-sense and good-feeling which would point out to the Muhammadans that the sacrifice of a cow is not enjoined by the text or tradition regarding the festival, but that, on the contrary, it is unusual, as it most certainly is seditious in India. In Turkey, Egypt, Syria, and Persia, where a cow might be sacrificed without causing the least offence to anyone, a sheep is preferred; why then should a cow be killed in India, where it is a most heinous crime in the eyes of the vast majority of the population, and when neither Scripture nor practice requires it throughout the Muhammadan world?

Dr. Leitner urges that British soldiers and officials should receive as little encouragement as possible in the consumption of beef. He adds:—

I cannot understand why a country that has produced Cromwell's Ironsides, should find it necessary to keep India with troops that have to be protected in any of their presumed gross appetites.

"The Divine Programme" for Africa.

THE hierophant in this case is the Rev. Joseph Cook of Boston, and his oracle, given in Chicago in August, and printed in *Our Day* for September, reads as follows:—

The chief miseries of the Dark Continent arise from twelve causes: (1) Isolation, (2) the slave trade and slavery, (3) the rum traffic, (4) cannibalism, (5) polygamy, (6) Paganism, (7) Mohammedanism, (8) tribal wars, (9) foreign aggression, (10) want of Christianity, (11) climatic conditions, and (12) lack of able native leadership.

Except that the climate and physical geography cannot be changed, it appears evident, from the signs of the times in all quarters of the modern horizon, that it is the Divine programme for Africa to remove these causes with their consequences.

The lack of able native leadership is, we are informed, to be supplied from among the negroes of the United States, who are not, however, to be deported or to emigrate in a body:—

The stern political necessities and industrial competitions to which our coloured populations are subject are an anvil of God on which He is forging a key to open not only to themselves but to the coloured populations of the world a better future.

A SCHOOL OF DEMOCRATIC CULTURE.

FOR a thorough-going endeavour to train young men and young women for the actual life which common people lead, and to give them an artistic, scientific, and practical apprehension of its meaning and possibilities, few, if any schools will come up to the Pratt Institute, Brooklyn, which Mr. J. R. Campbell describes in the *Century* this month. It is quite impossible to follow him through all the ramifications, new and old, of schooling which he traces. A few illustrations will suffice. When the homeliest of home duties are based on science, are studied and practised as an art, the method pursued in less humble branches of work can be readily imagined:—

THE SCIENCE AND THE ART OF DRESS.

The department of domestic art gives morning, afternoon, and evening instruction in sewing, dressmaking, millinery, and physical culture to over twelve hundred students. Without any precedent in this country—it might almost be said in the world... Besides instruction in methods and manipulation, the courses are designed to cultivate the pupil's taste. She is constantly led to consider the style of the making and colouring of hats and dresses from an artistic and hygienic standpoint. The instruction is broadened also by talks given in the class-room on the history and manufacture of materials and textiles used, and upon colours and form. Physical culture is essential in teaching the principles of artistic dress, since a well-proportioned body is necessary to symmetry of effect in dress. There is, therefore, a course in calisthenics, which students are encouraged to take. A course in drawing is given under the direction of the department of industrial and fine arts, beginning with pencil practice, and including study of drapery, drawing of waists and gowns, practice in use of colour, problems of design, and study of the human form.

THE THEORY OF COOKERY AND LAUNDRY.

These cases of food products, and of the chemical constituents of food; the charts showing what the food must supply to the human body; the models of different cuts of meat—all these facilities of instruction are only a hint of what is attempted in the kitchens, lecture-rooms, and laboratories. . . . In a word, it is the training of women in the sciences underlying the right administration of the house, and in the arts based upon those sciences.

Here is the normal class in domestic science. It is a liberal course which they are pursuing, including German, the physical sciences, biology, psychology, household economics, and applied chemistry. All instruction is by lectures, quiz, and laboratory practice. Besides these as theory, they are given practice in cookery, and in laundry work. The same students now studying the proportion of ingredients, effect of heat upon food, or engaged in the creation of some toothsome dish, may in an hour be at the Hoagland laboratory studying bacteriology.

BLACKBOARD JOURNALISM.

The daily newspaper of this institute, which is read immediately after morning prayers, is not a bad idea.

Blackboards stretching around three sides of the assembly room are filled each morning with important news, each editor being answerable for the news he places upon his blackboard. Maps and pictures are drawn to illustrate important events. Biographies are accompanied by portraits. The exercise lasts only twenty minutes, and doubtless has its value not only in keeping teachers and students up to date, but in its educative discipline. Other exercises of the school, intended to be supplementary to the study of civics and a training in practical politics, are campaign speaking, caucus, joint session of House and Senate, balloting, and registration.

"In literature, language, and science the laboratory method is employed." This is one tendency in all the work of the school.

The theory is that while literature cultivates aesthetically and ethically, while science stimulates observation, while mathematics trains the reasoning powers, manual training disciplines and strengthens the will.

BEAUTIFYING THE HOME.

In addition to the general institute exhibit above referred to, there is an alcove showing the work of the women pupils and graduates. . . . Almost every piece of work here is in some way connected with the idea of home. Woman's true emancipation, it would seem, does not take her from her mission as the maker and glorifier of home.

Though only five years old the Institute numbers nearly four thousand students. It has sent forth thirteen hundred and twenty women workers in professional and industrial spheres. It will shortly be transferred to a more commodious and beautiful building, its founder having constructed the present edifice in such a style as to admit of being turned into a factory if the school failed.

WHY CANCER INCREASES.

MR. H. P. DUNN, F.R.C.S., in his suggestive contribution to the *New Review*, adduces statistics which show that—

in 1867, out of a million persons, three hundred and ninety-two died of cancer; in 1890, out of the same number cancer was answerable for the deaths of six hundred and seventy-six. In short, the mortality from the disease has increased since twenty-three years ago to the extent of upwards of seventy per cent. . . . Investigation shows that among all the chief causes of mortality recorded in the reports of the Registrar-General, there is no death-rate which year by year maintains so pronounced an augmenting ratio as that of cancer. . . . There cannot be two opinions on the subject of the real increase of cancer.

The mystery which hangs over the real nature of this disease Dr. Dunn does not profess to dispel. He reminds us of its resemblance to tuberculosis, the mortality from which, however, is steadily decreasing:—

Analogy would seem to indicate that cancer *must* be a parasitic disease, a disease that is, whose *fons et origo* depends upon some micro-organism. . . . The belief is now commonly held that the identity of cancer with some micro-organism is only a question of time.

Dr. Dunn proceeds to propound the paradox that one of the causes of the increase of cancer is the general increase of health in the community! Cancer usually attacks persons of or over middle age; the decrease of mortality, and especially of infant and child mortality, has increased the number of persons who reach the cancer period of life; and then the great increase of possible victims of cancer naturally involves some increase of actual victims. The paradox is confirmed by the fact that cancer cases in early life are actually decreasing in number.

"So far as we know at present nothing can strictly be said to be a *cause* of cancer." The habit of smoking is held to favour its growth, but only, Dr. Dunn supposes, owing to the irritation of lip or tongue by the stem of the pipe. The old theory that the disease is hereditary must nowadays, he says, "be held to be untenable." He gravely doubts the truth of the common impression that cancer can neither be "caught" nor "given." If, as seems growingly likely, it proceeds from a microbe, then by the analogy of tuberculosis it would be infectious and contagious.

CRIME AND VICE IN BERLIN.

FROM A FRENCH POINT OF VIEW.

In the *Revue des Deux Mondes* of the 1st of September M. Raffalowich contributes an interesting account of the German police and of criminal Berlin. Since the year 1742 immense powers have lain in the hands of the Berlin police, though the present organisation was only planned and regulated in 1822. The President of Police is practically the Prefect of Berlin as well, and represents the State in his dealings with each subdivision of the town, having really complete control of all that concerns the health and well-being of the population. Even the Berlin Municipality is under the direct supervision of the President of Police.

THE POLICE.

The German policeman cannot complain of his lot, for he is only expected to work during the day. After ten p.m. Berlin is confided to a number of individuals who are entitled "Watchers of the Night." These men wear a special uniform, and carry a whistle and a sword; they come on duty at ten p.m., and patrol their district till five or six a.m. Berlin is manned by three thousand five hundred policemen entirely drawn from the ranks of non-commissioned officers, who must have spent at least nine years in the army before they are eligible for a post in the police force. The policemen live on excellent terms with the townspeople, and are both liked and respected. Berlin is divided into eighty-two police districts, each officered by a Lieutenant of Police, who has under him two sergeants, two telegraphists, two messengers, twelve policemen, and two detectives, the latter carrying revolvers.

THE POLICE DES MŒURS.

It is impossible, says M. Raffalowich, to give exact statistics of the number of thieves, murderers, and criminal loafers who make any great town their centre. We are sorry to note that the laws affecting the State Regulation of Vice are in full force in Berlin, for there are four thousand *filles inscrites* on the police registers. But it is only fair to add that, so far from encouraging a woman of bad character to enter her name on the registers, the police say they only invite her to do so after she has several times received warnings of her fate, and any woman's name will be struck off the roll if she consents to enter one of the numerous homes or refuges with which the town abounds.

THIEVISH JEWS.

Germany seems to boast of a proud pre-eminence both in the number and intelligence of her thieves; but it is rare indeed that a burglary is complicated by a murder. The thieves of Berlin are thoroughly organised. At the beginning of the century there existed in the province of Posen a whole Jewish population, who lived exclusively by breaking the eighth commandment, and educated their children to do the same. Their greatest prosperity was between the years 1820 to 1830, for towards the middle of the century most of them found it convenient to distribute themselves in the various towns of Prussia. In Berlin some of these Posnians found kindred spirits, but gradually the Jewish element disappeared, and the Berlin criminal of to-day is nearly always either Protestant or Catholic; yet strangely enough the trace of the old influence remains in the thieves' slang, which is largely composed of Hebrew words.

PICKPOCKETS.

The pickpockets of Berlin (*Torf-druckers*) are celebrated all over the world. They find their happy

hunting ground in great crowds, in theatres or circuses, and in railway stations. Their victims are generally strangers or provincials. To the apostles of the craft is given the task of dealing with the pockets of drunkards or those who fall asleep on benches. Women make the best shop thieves, and the Berlin female pickpocket has an ingenious series of little hooks fastened under her gown, on which she is able to hang the various treasures she collects on her way. Another interesting category are the criminal locksmiths; but they are beaten hollow, says M. Raffalowich, by their English brethren, who occasionally condescend to give a benefit performance in Berlin. Thus, the great robbery which took place at the house of Paasch the banker was executed by a gang of London thieves.

The capital of Prussia is also a great centre for the coining of false money; and clever groups of bank-note forgers and coiners are arrested every year. The German police, like that of Paris, makes great use of what may be styled criminal detectives—spies, who for a consideration are willing to sell their comrades; they are paid according to the value of their work, but are never cited in public as witnesses against their comrades.

THE CRIMINAL PORTRAIT GALLERY.

Seventeen years ago the photographic album system was commenced, and in 1890 the Album consisted of thirteen volumes, of which three were devoted to the portraits of international criminals; in addition to this collection the autographs of all those who pass through the prisons are given, and when possible a list is kept of each prisoner's aliases, nicknames, birth-marks, scars, etc., etc. In the last ten years over one thousand criminals were tracked down by this system; but up to the present time no attempt has been made to introduce the anthropometric method, said to be so successful in France. The Berlin police have an organ, edited by themselves, containing matter only interesting to the force, and an up-to-date list of all home and foreign personages who are "wanted."

The German laws against obscene or pornographic literature are extremely severe, and in one year the police seized 16,000 copies of one indecent publication. Those who deal in such wares have become exceedingly wary, and will only procure anything of the kind on order. It is pleasing to hear that often the client, after giving a large sum for a pornographic publication, is disappointed in the quality of the goods provided him, being sent instead of the immoral book he longed for, a dull French novel.

"THE REFUGEES," by Dr. A. Conan Doyle, appears in German translation as the supplement of *Veltheim*, which commences a new volume with the September number.

THE *Medical Magazine* for September, which is principally educational, and offers many suggestions for the employment of the fifth year recently added to the medical curriculum, declares that for the medical aspirant to a career in Her Majesty's service "three things are obligatory. In the first place, he must be a gentleman by birth and education. Next, he should have a real liking and respect for his profession. And, lastly, he ought to steel his heart against wedlock." The editor endorses Mr. Eric Erichsen's plea for the federation of the London hospitals for clinical purposes, for lack of which students are driven to Vienna and elsewhere.

A BANKING SYSTEM FOR THE PEOPLE.

HOW HER BANKS HAVE MADE SCOTLAND.

THE *Forum* for September contains an instructive account of "Scotch Banks: Their Branches and Their Cash Credits," by Mr. A. S. Michie, president of the Royal Bank of Scotland:—

In no other country in the world (he says) are banking facilities so extensive as they are in Scotland. While in England there is a bank, or branch bank, to about every ten thousand of population, in Scotland there is one to about every four thousand . . . The banks . . . accept at interest deposits of sums as small as five pounds, and allow current accounts to be opened sometimes with trifling balances . . . The depositors in Scotch banks who have not more than one hundred pounds to their credit, on deposit receipt or on current account comprise about three-fourths of the whole number. The result is that the aggregate banking deposits of a comparatively poor country, with few sources of natural wealth, and with a population of little more than four millions, exceed £93,000,000.

"The authorised issue" of notes by any bank, against which no coin is required to be held, was fixed by an Act of 1845 as the certified average amount of notes in circulation during the twelve months preceding May 1st, 1845. The total authorised issue recently returned amounted to £2,676,350, while the total average of notes in circulation was £7,127,921. The notes in till would probably represent an equal sum. The coin actually held was £5,469,494, or more than a million above what was necessary. The excess of the actual over the authorised issue is now so great, as to change the profit once made into a positive loss—a loss Mr. Michie now estimates at £42,000 per annum.

[HANDS OFF OUR PAPER CURRENCY]

The Scottish banks have always maintained, when successive Governments have shown signs, more or less plain, of laying hands upon the privilege of issue enjoyed by the issuing banks of the United Kingdom and creating a Government issue in its stead, that the matter affects the public more than it affects themselves. If the banks concerned were to be deprived of their issues and were obliged to substitute gold or Government notes for their own notes as till-money, it would mean that they would be forced to close many of their branches because of the impossibility of their being able then to conduct them at a profit. It would mean also that they would have largely to restrict (in the case of the Scotch banks, to the extent probably of several million pounds) the accommodation which they have been in the habit of extending to their customers. It certainly would be a great mistake for any Government to tamper with the paper currency of Scotland, which has so admirably served the needs of the country and added to its wealth for so many generations. Through it the public have never lost a penny.

THE CASH CREDIT SYSTEM.

A unique feature of Scottish banking is the cash credit system. It was devised by the directors of the Royal Bank in 1728, and in an experience extending over nearly one hundred and seventy years the banks have found it "work in the main with perfect satisfaction, and to be rarely attended with loss."

The system is very simple and is especially adapted to the needs of a man in business who has money coming in day by day. Such a man may be well-to-do and able to give security (readily marketable securities are of course preferred) for the credit he desires; or he may be penniless, with no capital but his character, and be able to offer no security but the guarantee of two friends. In either case, he goes to the bank and arranges a cash credit for a specific sum. When it is established by the banker, he may then check against it whenever it suits him. He may draw as little of it or as much of it

as he pleases, but he must never exceed the maximum sum arranged for. Interest is charged to him day by day only upon the sum of which he is found to have availed himself each day. The cash credit is of the nature of a permanent arrangement, and so long as confidence is maintained and everything works smoothly, it may, and often does, exist for years. The rate charged will average from four and one-half to five per cent., but it is manifest that such a rate, charged on fluctuating balances, may be, and it generally is, more favourable to the customer than would be a considerably lower rate charged upon a specific sum for a specific period. It is not too much to say that the cash credit system has largely contributed to the wealth of Scotland.

The average dividend for the last year of the ten banks is eleven per cent., while the average dividend of a similar number of English banks, whose position is in all essential points the same, except for the important difference that they have no note issues, is seventeen per cent. . . . Their stocks stand in the market at an average premium of one hundred and sixty-five per cent., and that the average yield to present purchasers is only a little more than four per cent.

SOME DUTCH MAGAZINES.

De Gids opens with the first portion of a novel by Louis Couperus, whose *Noodlot* was translated into English and published about two years ago under the title of *Footsteps of Fate*. The new novel (*Majesty*) begins well, describing troubled times in "Liparia"—inundations and a ministerial crisis; it promises to maintain the author's reputation. Dr. J. S. Warren concludes his *Sacred Fables*, dealing in this instalment chiefly with the stories and sayings of Buddhist writings and wise men. He shows us that many of our fables and legends most probably have their origin in those writings. The stories in which woman is spoken of in a becoming manner belong to pre-Buddhist times. Dr. Byvanck continues his account of the youth of Isaac da Costa. The alteration of the Electoral Law is a "burning question" in Holland at the present time, and receives treatment both in this magazine and in *Vragen des Tijds*. It is proposed to give votes to all those (men) who can read and write, and are able to maintain a dwelling-place, these two qualifications being interpreted thus: the ability to write an application for one's name to be placed on the List of Voters; and the absence of one's name from the books of workhouses and benevolent institutions.

Vragen des Tijds contains two articles in addition to that just mentioned: one on the Triumph of Wagnerism, and the other on the Simplification of Spelling and Declension. This latter article is instructive as showing the spread of the tendency to make things easier for the scholar and thus save time to be devoted to the acquisition of further knowledge. There is not much difficulty in the Dutch declensions; but those who regard declension of any kind as a hindrance will rejoice to know of this attempt to make a step forward in the direction which accords with their ideas.

Elsevier's Geillustreerd Maandschrift, unlike the other two magazines, is (as its name shows) illustrated, and well illustrated too. The interview with the Dutch artist, Elchanon Verveer, affords an opportunity for reproducing several of his works. This article is followed by the opening chapters of a novel, "Clever Jan," which is worth reading; a humorous and well-written short story, the title of which may be freely translated as "The man who didn't like soldiers"; a visit to Alphonse Daudet; and some miscellaneous matter. A very fair number all together.

THE PRINCESS OF WALES.

A CHARACTER SKETCH.

THE place of honour in Annie S. Swan's new magazine, *The Woman at Home*, is given to a sketch, with numerous portraits, of the Princess of Wales. The parts of it which will probably appeal most to the democratic sympathies of the modern woman are those which tell of the straitened circumstances in which Her Royal Highness was brought up. Looking back to the wedding-time, the writer remarks:—

In the papers of the period there was very little said of the Princess's early life; possibly it was not thought respectful to allude to the wife of the heir to the English throne having known what the stress of poverty meant in her youth. This bit of snobbishness might well have been done away with; if anything could have added to the heartiness of her reception, the consciousness that she had that personal knowledge of poverty which is the surest bond of brotherhood, would have fastened her even more firmly to the majority of the hearts she had come to rule over. Judging from the simple manner in which she has brought up her daughters, the Princess herself is far too fine and noble a lady to have the slightest desire to ignore that period of her life when, rumour says, she and her sisters made their own dresses and trimmed their own bonnets.

FROM POVERTY TO ROYALTY.

When the Princess was born, in 1844, her father was not in the direct succession to the crown of Denmark. Indeed, so far was he from close relationship to the then king, that he had to go back to common ancestry of them both in the fifteenth century.

The Princess and her sisters were all educated at home, and seem to have led very quiet and retired lives. There is a rumour, which, however, we cannot vouch for, that during her childhood her father was so poor as to be compelled to earn money by giving drawing lessons in a little town in Germany. It is not at all unlikely to be true, for with a very small income and a large family, Prince Christian may well have been reduced to such straits. His beautiful, amiable wife, whose quiet dignity was so much admired at her daughter's wedding, apparently has not been less loved by the simple, kindly people she has reigned over for having experienced the lot common to most of her subjects. With the recognition by the nation of the Prince's heirship to the throne, brighter, or at least easier times, must have come.

AN UNEXPECTED EVENT.

The story of the birth of the late Duke of Clarence shows that there are contingencies from which even Royal households are not exempted.

His birth took place under somewhat unusual circumstances, for whereas he was not expected until March, he arrived with such promptitude at Frogmore one Friday evening early in January, when his mother had been skating on Virginia Water, that there was not a single garment there for him, and the local draper had to supply the best he could, until the carefully-prepared little garments could be sent from Marlborough House, where due preparations were being made for him.

Cordial emphasis is laid on the affection which led the princely pair to keep their children ever near them.

There are those who speak of Prince George as having been a veritable pickle in those days. Very funny stories are told of his pranks, especially those played upon his grandmother, of whom the young gentleman seems to have stood in no fear whatever, notwithstanding her august condition and titles.

THE TIRED SEWING GIRL.

Here is a pretty incident which will bear telling often:

Crossing the hall of Marlborough House late one afternoon just before Christmas, she saw a delicate-looking young girl standing there waiting. Noticing her tired expression and her

modest demeanour, the Princess asked her to sit down and inquired her business. She had brought some little garments for children, which the Princess had ordered to be made by the then new-fashioned sewing machine. The Princess took the girl, who was quite ignorant of who her conductor was, into her own room, examined the garments, and praising the neatness of the work, asked who did them. The girl replied that she had made them. She had an invalid mother to support, and she hoped by becoming an expert and good worker on the new machines that she might be able to save enough from the shop, which took her away from home all day, to purchase a machine of her own, when she might be able to earn a little more than bare bread for her mother. The Princess rang the bell, and ordered a basket to be brought with some wine, oranges, and biscuits in it, asked the girl's address, and gave the basket to her to take home. On Christmas morning what was the girl's astonishment to receive a handsome new sewing machine with a paper attached to it bearing the words, "A Christmas gift from Alexandra."

Incidents of the kind quoted above suggest a line of defence for our monarchical institutions which, perhaps, is not sufficiently recognised. In this country every political arrangement, even Royalty itself, exists solely by the sovereign will and pleasure of King Demos. That this gruff potentate demands character in those who aspire to become crowned presidents of his realm, has been made abundantly evident, and the womanly virtues of the Princess of Wales cannot fail to increase the stability of the Throne. But, this condition once satisfied, few things could appeal more strongly to the heart of Demos than to feel that Royalty itself had tasted poverty. Demos knows what poverty means. His life is one long battle with it. And just as in the old fighting days, the monarch's power was strengthened by the fact of his having dared the perils and borne the scars of actual warfare, so now the monarch gains in security by being known to have faced and felt the onset of want. The day may come when the story that the Princess Alexandra once made her own dresses, and that her father worked for his living like other poor men, will do more to uphold British Royalty than all the ancient pedigrees and blazonry and wealth it has ever gloried in.

An Electric Whirlpool.

It is probable that we are only at the beginning of the utilisation of electricity for the cure of diseases, and this being the case it is only natural that there should be some interest excited by the claim made by M. Arsonval, who has described as his own an invention of an electrical medical apparatus which bears, to say the least, a very suspicious resemblance to a machine invented by Professor D'Odiardi. Professor D'Odiardi communicated a description of the apparatus in 1892 to a French engineer with a view to having the instrument made in France and communicated to the Academy. Nothing more was heard of it until this year when M. D'Arsonval described a machine closely resembling that of Professor D'Odiardi, as if it had been an invention of his own. It is impossible for an uninstructed outsider to explain how this machine works. The patient seems to live in the centre of wire coils through which electricity is passed in order to induce currents in his inside in the form of an electric whirlpool. Edison noticed long ago that men who worked near the dynamos never suffered from either consumption or rheumatism, and Professor D'Odiardi believes that if you live inside his coils and have the electric whirlpool kept going on inside your body you may probably live for ever, or at least for a much longer time than would otherwise be possible. Pleurisy, dropsy, and tumours could be treated in this fashion.

THE GERMAN TRAMP.

AS STUDIED BY AN AMATEUR VAGRANT.

MR. "JOSIAH FLYNT" recounts in the *Century* his experiences of "Life among the German Tramps." He was in Berlin. He wanted to study the German variety of vagrancy. He inquired of the Berlin beggars. He applied at the Statistical Bureau; but without gaining what he sought. At last Dr. Bertholdt said to him, "The only way to know the entire truth about the tramp is to live with him." Mr. Flynt having played the tramp in his own country readily fell in with this advice, rigged himself out accordingly, and, set out on his travels. In the fourth class railway car, he picked up an invaluable companion, Karl, who initiated him into the mysteries of trampdom. He learned that the title of honour by which tramps knew each other was *Chausegrahentapezirer*, upholsterer of the highway ditches. He slept at nights in the tramps' lodging-houses in the cities and out in the country in barns. He found a regular market or exchange carried on in the sleeping resorts.

THE BEGGAR'S WAGES.

He remarks :—

I was struck in these auctions by the absence of Jews. In fact, I met only three during the trip, and they were extremely well dressed. . . . I think the usual wage for diligent begging is between one mark fifty and four marks, in addition to the three meals. Of course there are a few who are much more successful. . . . There was one beggar in the room who even kept an account of his income and expenses. I saw the record for March, and found that his gains had been ninety-three marks and a few pfennigs, not including the meals which he had had in various kitchens where the servants were friendly.

Here is a characteristic incident :—

Five tramps, including myself, had stopped on Easter night at one of the large bonfires that the peasants had built, just outside of Hanover, to commemorate the great holiday. When we arrived they were carousing most jovially, and seemed only too glad to welcome other companions; so we all took part, and danced around the fire, sometimes with the peasant girls, and then again by ourselves or singly. The peasants took no notice of the fact that we were tramps, and shared their sour milk and brown bread with us as if we were their best friends.

SUMMARY OF RESULTS.

I was tired, nauseated, and homesick. I made quick work with the towns of Elberfeld, Essex, Barmen, and Dortmund, and once settled down in Berlin, with almanac and gazetteer before me, found I had been 15 days "auf der Walze," on the tramp, had travelled over 1000 kilometers, studied more than 70 towns and villages, and met 341 voluntary vagrants, all of them, however, less voluntary than I.

The German tramp, if these experiences justify me in judging him, is a fairly intelligent fellow of not more than average tramp education, more stupid and less vicious than his American *confrère*, and with the traits of his nationality well stamped upon him. He is cautious, suspicious to a degree, ungenerous, but fairly just and square-dealing in the company of his fellows. He is too much of a Bohemian to be a Social Democrat, but has not enough patriotism to be easily fired with enthusiasm for his Kaiser. He loves schnappa. Liquor is just as much of a curse in Germany as anywhere else, and brings more men into trampdom than is calculated. The Schnappsfiasche (brandy flask) is in nearly every tramp's pocket, and he usually empties it twice a day. Yet I found just outside of Brunswick a female tramp, nearly sixty years of age, who could empty Die Finne (the flask) in a single "go," and seemed healthy too. This woman was the only feminine roadster I met during the journey, and I think she is one of the very few.

In regard to the public on which the German tramp lives and thrives, it is only necessary to say that it is even more inanely generous than its counterpart in the United States. With all its groans under taxes, military and otherwise, it nevertheless takes upon itself voluntarily the burden of the voluntary vagrant—the man who will not work.

POETRY IN THE PERIODICALS.

THE poem by Mr. Swinburne in the *Nineteenth Century* is entitled "The Palace of Pan," and inscribed to "my mother." It is a description of the autumn woods, and is marked by the wealth of colour and the honey-sweet flow of sound which we always associate with the work of this poet. One stanza, which rings out its verses in such rugged rhymes as "panic," "Titanic," "volcanic," seems meant to act as the passing discord which deepens our sense of the general harmony. Of the thirteen stanzas, take this as a sample :—

THE PALACE OF PAN.

As the shreds of a plumage of gold on the ground,
The sun-flakes by multitudes lie,
Shed loose as the petals of roses discrowned,
On the floors of the forest engilt and embrowned
And reddened afar and anigh.

AMONG the poetry which the World's Fair has called forth, the fine stanzas contributed by Mr. R. W. Gilder to the *Century* deserve to take a leading and a lasting place. This is the second stanza :—

THE VANISHING CITY.

Thou shalt of all the cities of the world
Famed for their grandeur, ever more endure
Imperishably and all alone imperiled
In the world's living thought, the one most sure
Of love undying and of endless praise
For beauty only,—chief of all thy kind;
Immortal, even because of thy brief days:
Thou cloud-built, fairy city of the mind!
Here man doth pluck from the full tree of life
The latest, lordliest flower of earthly art;
This doth he breathe, while resting from his strife,
This presses he against his weary heart.
Then, wakening from his dream within a dream,
He flings the faded flower on Time's down-rushing stream.

MR. ALFRED AUSTIN, at the close of the picturesque article he contributes to the *National Review*, introduces a poet into "The Garden that I Love." The poem which this guest recites overflows with melodious melancholy. The second stanza :—

IF LOVE COULD LAST.

If Love could last, the rose would then
Not bloom but once, to fade again.
June to the lily would not give
A life less fair than fugitive,
But flower and leaf and lawn renew
Their freshness nightly with the dew.
In forest dingles, dim and deep,
Where curtained noonday lies asleep,
The faithful ringdove ne'er would cease
Its anthem of abiding peace.
All the year round we then should stray
Through fragrance of the new-mown hay,
Or sit and ponder old-world rhymes
Under the leaves of scented limes.
Careless of Time, we should not fear
The footsteps of the fleeting Year,
Or, did the long warm days depart,
'T would still be Summer in our heart,—
Did Love but last!

MR. KEELY'S SYSTEM OF PHILOSOPHY.

PAUL JANET, in writing of the origin of the philosophy of Comte, said of the different and contrary conceptions found in various so-called systems, that they arise, he thinks, from the fact that *no true system of philosophy has yet been propounded*, and that only when a "*véritable système*" has had birth will all diversities and contradictions disappear from the teachings of the schools.

However willing thoughtful men and women may be to admit that "Science has done a great work in cleaning away the kitchen-middens of superstition," they see that her methods are at fault and that the results are disappointing failures. Edward Carpenter, in a criticism on modern science, says, "Science has failed because she has attempted to carry out the investigations of nature from the intellectual side alone—neglecting the other constituents necessarily involved: she has failed because she has attempted an impossible task; for the discovery of a permanently valid and purely intellectual representation of the universe is simply impossible; and it must be confessed that Science now finds herself in almost every direction in utterly hopeless quandaries."

If, as Carpenter asserts, Science has landed herself in pure absurdities in every direction, while the unknown thing remains unknown, the independent existence around the corner still escapes us, the time has come in which it may be well to look into a philosophy that, for the first time, gives us a system which teaches "a vast organisation, absolutely perfect and intimately knit, from its centre to its utmost circumference, existing embryonic in every individual man, animal, plant, or other organism, the object of all life, experience, suffering, and toil—the ground of all sensation, and the hidden yet proper theme of all thought and study."

This is the philosophy which Keely's system discloses, as made known in Mrs. Bloomfield Moore's book, "Keely and his Discoveries: Aerial Navigation. The Practical Result of these Discoveries."* It is asserted that Mr. Keely has demonstrated to men of science his ability to "hook on his machinery to the machinery of nature," drawing therefrom a harmless propelling and controlling power, which, it is claimed by him, is the force which keeps the planets in their places, lifts the oceans from their beds, and controls the universe: and to be the only safe and suitable energy for navigating the highways of the air.

After Mrs. Bloomfield Moore's book was completed and in print, she received from Mr. Grant Allen the following prefatory note, intended for its pages, which we have the privilege of making room for in our columns, and which cannot fail to create some interest in the publication:—

In this volume Mrs. Bloomfield Moore endeavours to give some account of the physical philosophy of Mr. Keely, who claims to be the discoverer of an unknown energy. There can be no doubt at all that Mrs. Moore is thoroughly competent for the task she has set herself; for no other person has been so intimately associated with Mr. Keely's work during the last ten years, and no other has followed it throughout with such disinterested and single-hearted enthusiasm. It is impossible not to sympathise with so rare a determination to assist struggling genius. In Mrs. Moore's opinion, Keely has made great discoveries; and she has generously devoted no little time and trouble to aid the inventor in gaining public recognition. Now, I am a heretic in physics myself (though my heresies are not the same as Mr. Keely's), and therefore I am interested

in the general principle that all heresies should meet at least with a fair and open trial at the bar of scientific opinion. That fair and open trial is now demanded for the views promulgated in the present volume. All its author asks is an impartial judgment; and Mrs. Moore is herself so conspicuously honest and candid that she deserves no less at the hands of specialist critics.

The work, as I regard it, is rather concerned with Mr. Keely's theories and with Mr. Keely's philosophy, than with his actual performance. Now, what the world most wants is rather proof positive and material of the existence and reality of the unknown power. As soon as it can be made to "do work" (if I may borrow the very unsatisfactory phrase of the modern physicists) practical men, I take it, will be only too glad to employ the latest known form of energy. It appears, however, that grave difficulties are supposed by many to stand in the way of the practical utilisation of the alleged motor. Till those difficulties have been overcome it is but natural that an incredulous world should stand by and suspend its judgment, if indeed it does not refuse to so much as suspend it. But Mr. Keely is fortunate in having found a supporter whose faith rises to the full height of so painful a situation. If success should ever crown his life-long efforts, it will be largely to Mrs. Moore's unfaltering encouragement for the last ten years that the world will owe its new motor.

With regard to the theoretical part of the present work—and it is mainly theoretical—I should be inclined to say that a great many of the principles for which Mrs. Moore contends have now been reckoned among the probabilities or even the certainties of science. Such are the principles of the unity and uniformity of energy, the reducibility of all energies to a single ultimate kind, and the underlying antagonism between forces and energies. But others, more novel, are couched in a new terminology of Mr. Keely's inventing, and are difficult for the physicist to correlate with the ordinary principles of his known science. To say this is not, of course, equivalent to condemning them, for every new science has had to begin by inventing its own terminology, and electricity in particular passed at first through a stage of very curious nomenclature, proved by later research to be in large part erroneous. But the language in which Mr. Keely clothes his ideas is so peculiar to himself that it cannot readily be followed by physical investigators. Much of it, I must confess, conveys little meaning to me. Nevertheless, I have honestly done my best to grapple with the reasoning involved, and I shall watch henceforth with the greatest interest the final developments of Mr. Keely's mechanism.

Every great thing that has ever appeared on this earth began by being somebody's "fad" and somebody's "eccentricity." For that reason I have always felt that we should be very receptive to fads and eccentricities, even when they don't happen to appeal to us personally. We should remember the fate of Young's undulatory theory. It is better that a thousand doubtful philosophies should stand their trial before the world than that one truth should run the risk of being crushed to death prematurely or being stifled still-born. On this ground, therefore, I would ask a respectful consideration for the work of an able, a single-minded, and a disinterested thinker like Mrs. Moore. In a universe where so many unknown powers surround us it is possible there are more things in heaven and earth than are dreamt of in our philosophy.

THE REVIEWS REVIEWED.

THE FORTNIGHTLY REVIEW.

AMONG many articles in the *Fortnightly* of high value and bearing noted names, Dr. Pearson's on "The Causes of Pessimism," which along with Mr. Arnold White's paper on the Unemployed is noticed elsewhere, fitly stands first. A pathetic interest attaches to the late Mr. J. A. Symonds' "Notes of a Journey in South Italy"—a series of extracts from his last diary. Dr. McKendrick describes at length the marvellous structure and behaviour of the electric fishes, and concludes that the study of these and allied phenomena may serve as guides to the invention of better electrical appliances than those we have in use. Lady Dilke treats of "The Industrial Position of Women."

Sir Robert Ball, in his "Atoms and Sunbeams," follows up further Helmholtz's solution by the theory of shrinkage of the paradox that the sun—

has radiated forth already a thousand times as much heat as could be generated by the combustion of a sphere of coal as big as the sun is at present; and yet, notwithstanding this expenditure in the past, physics declares that for millions of years to come the sun may continue to dispense light and heat to its attendant worlds with the same abundant prodigality.

HOW TO WRITE HISTORY.

Mr. Frederic Harrison discloses in the form of a dialogue what he conceives to be "the royal road to history."

Well, what I would advise a young man going into the historical line to bespeak is—first, indefatigable research into all the accessible materials; secondly, a sound philosophy of human evolution; thirdly, a genius for seizing on the typical movements and the great men; and, lastly, the power of a true artist in grouping subjects and in describing typical men and events. All four are necessary.

The fault of Oxford is that she seems to think the first to be enough without the rest. The four qualifications were combined, or very nearly combined, by Gibbon.

History is only one department of Sociology, just as Natural History is the descriptive part of Biology. And History will have to be brought most strictly under the guidance and inspiration of Social Philosophy. The day of the chronicler is past; the day of the literateur is past. . . . The histories of the future . . . will illustrate philosophy.

UNIVERSITIES, NAPOLEONIC AND GERMAN.

Mr. Patrick Geddes supplies an exceedingly valuable sketch of university systems past and present. Especially interesting is his contrast of the two most potent modern systems, the Napoleonic and the German. Napoleon was "the first and still supreme educational autocrat," Wilhelm Humboldt "the first and still foremost educational statesman of the century." Napoleon planned "to make a cast-iron examination system, workable by a militarised bureaucracy, to turn out mandarins and stool-covers." His system, "introduced and organised cram," set the model to the London University and our Education Departments. Humboldt and the Germans granted freedom to teach and to learn, laid chief stress on original research, and as a result have created a system productive of intellectual life and progress unequalled in the world. The Englishman, even when triumphantly productive—

remains always (as the German recognises at a glance) more or less of an amateur. Our greatest scientific names, in fact, are instances of this—witness Darwin, Lyell and Murchison, or take any other line of special study, such as economics.

The ideal now striven after in England, Scotland and America, is German.

THE NINETEENTH CENTURY.

THE *Nineteenth Century* attains this month its two hundredth number, and its contents are worthy of the occasion. It has several first-rate articles. Mr. Auberon Herbert's satirical *Vale-mecum* for Cabinet Ministers, Professor Mavor's "Setting the Poor to Work," Mr. Crackanthorpe's "New Ways with Old Offenders," Mr. H. A. Jones' reply to "Dr. Pearson on the Modern Drama," and Mr. Swinburne's poem are noticed elsewhere. Professor Prestwich bewails the anomalous "position of Geology" in this country at the present time, with its freedom of inquiry restricted on the one side by the Uniformitarians, who assume that every position must be reduced to a fixed measure of time and speed, and on the other by the Physicists, who remind geologists that the subject is outside their sphere of inquiry, and Rev. Canon Irvine tells how with his help Thackeray took as his "Study" for Colonel Newcome—

Captain Light, an old officer of fine profile and a grand "frosty pow," who had served Her Majesty and Her Royal predecessors in an infantry regiment, and had lost his sight (so he told us) from the glare of the rock of Gibraltar. Blindness had brought him to seek the shelter of Thomas Sutton's Hospital, where he lived with the respect of old and young, tended lovingly through all the hours of daylight by his daughter.

DR. MARTINEAU ON THE NEW TESTAMENT.

Mr. Kendel Harris' criticisms have led Dr. Martineau to write a second paper—of rejoinder and explanation—on the Gospel of Peter. The article concludes:—

On the whole, the fresh light which the researches of the last half-century have thrown upon the early life and literature of Christendom during the growth and selection of a body of sacred writings, justifies by new reasons our thankfulness for the New Testament as it is. Clear as it has become that the volume has been made up, not by supernatural dictation or even by critical discovery of authorship and testing of contents, still clearer is it that what has been let drop can claim no preference over that which has been saved; and that, in consulting and defining, from time to time, the Catholic feeling of the Christian communities, the Church authorities, in the name of the Holy Ghost, have really been prevailing led by good sense and practical piety.

"THE FATHER OF THE FRENCH PRESS."

Mr. James Macintyre recounts the story of Théophraste Renaudot, who in 1631 founded the first French newspaper, the weekly *Gazette de France*. This journal, strange to say, has survived all the vicissitudes of French history and is alive to-day. Mr. Macintyre is tempted into comparisons between "Old Journalism and New."

Much has been heard lately of something called the New Journalism. Its character is vague and nebulous, differently explained by different exponents, but its main features seem to be the glorification of the personal, the unveiling of all secrets and scandals of diplomacy and courts and the utilisation of ingenious schemes which serve primarily as an advertisement, and subordinately as a decoy to prospective material advantage. When the last-mentioned characteristic is given full play, the literature is merely thrown in. It ought to be pointed out that to call this thing New Journalism is a misuse of words. It is not new at all. There is scarcely one of its devices which is not as old as the *Gazette de France*, and few of them reach the utility of Renaudot's schemes. . . . In Court secrets Renaudot's achieved feats which would raise the envy of the most advanced exponent of the pseudo New Journalism. He had among his regular contributors King Louis the Thirteenth himself; Richelieu supplied him with paragraphs; and his successor, Cardinal Mazarin, sent accounts of battles and victories which never took place.

THE CONTEMPORARY REVIEW.

THE *Contemporary* for October is very far from a record-breaking number. The specific gravity of most of the articles is decidedly high. Mr. Hunter's attack on Mr. Goschen's finance, noticed elsewhere, will probably make most stir. Professor Weissmann concludes his reply to Mr. Herbert Spencer, but how far he has established his comprehensive thesis—"the All-sufficiency of Natural Selection"—no one who is not thoroughly at home in the technical vocabulary of biology could venture to pronounce. Nor does Mr. Romanes' note on panmixia allure the *profanum vulgus*. Professor Ramsay's researches concerning "The Holy City of Phrygia" are more recondite than attractive.

CHINESE ART AND ARTFULNESS.

The brightest of all the articles is one by Rev. W. A. Cornaby on "Chinese Art, an Index to the National Character." There is a piquant individuality about the writer's style which is as rare as it is refreshing. We quote a few sentences:—

The straight line is an abomination to the Chinese. . . . They will always substitute a curve wherever possible, or they will torture it into a zigzag. . . . They think in curves and zigzags. To the Chinese mind the straight line is suggestive of death and demons. . . . The Egyptians, and after them the Greeks, idealised the straight line. The Chinese have idealised the curve and zigzag, notably in their national emblem, the dragon.

Chinese art is sombre, where Japanese is volatile. The latter is a necessary overflow of high child spirits; the former is a somewhat pessimist protest against the real. . . . The characteristic of Chinese art and literature may be expressed in the one word, euphemism.

Idealist dreamers and coarse Coolies, or combinations of the two in varying proportion, make up the Chinese nation. . . . The scholar and the Coolie alike are idealists, each in his own way. The ideal is not real, therefore the unreal is ideal, is the syllogism at the basis of Chinese art, religion, and thought generally. . . . The high classical ideal in art and literature, then, is luminous mist.

"A NATION OF ARTISTS"

After pages of this glittering satire, Mr. Cornaby at last reveals his objective, which is, in plain English, the conduct of the Chinese officials before and after the riots. The mandarin, "unusually gay,"

proceeds to draw up an idealised account of the doings of the rioters and of their provocation. Dr. Fell, well versed in anatomy, and a lover of exact definition, may exclaim at his leisure, "All Chinamen are liars;" but we, for once euphemistic, do but affirm them to be a nation of artists, the principles of which art may not be tabulated too rigidly, nor arranged in cruelly straight columns.

In the closing paragraph the mask of satire is almost dropped in the strenuousness of the practical demand:—

The lion (with apologies to the emblems of other countries) makes a spring—in a straight line, of course. The dragon is caught! Not so. With many an intricate curve it soars on high, far above the lion's head. Emboldened by this magnificent success, the anti-foreign schemers lay their trap, carefully concealed by imperial proclamations on tissue paper, torn in some places, but easily patched up with more tissue paper, on which is written an artistically softened account of the late riots. Meanwhile . . . as, not the dragon Emperor with his smooth promises, but a certain old dragon—of the existence of which it is now the turn of China to reassure the West—seems to be the master of mobs of ten thousand barbarians, yelling for the death of two peaceable men, there is a pressing need for the speedy importation of a little real, straight moving justice into this land of curves and zigzags.

"THE COMMUNAL CONTROL OF LAND."

Mr. Munro Ferguson, M.P., charges Parliament with having proceeded in regard to land—

Not only on different, but on inconsistent principles. For, in the first place, State arbitration has been instituted to rectify the relations of owner and occupier; in the second, tenant occupiers have been helped to become occupying owners; and in third, local authorities have obtained certain powers to acquire and administer land.

The first arrangement ultimately results in "legislative enactments providing for land purchase." The second only turns the unearned increment into the pockets of a lawyer, instead of a number of landowners, and extends the vices of landlordism over a greater area of the population. In the third Mr. Ferguson finds the logic of the situation. "The drift of Land Reform" sets towards communal control.

Its strength lies in its flexibility. In one district the land system could remain entirely unchanged; in another a few allotments might be formed; in a third small holdings; while all the while private effort might be stimulated. Owners might be bought out from a city or from a countryside; for the system can be applied equally to the site of a cottage or of London, to the island of Lewis or a roadside allotment. Land commissioners would no longer be needed, and with a few minor Acts the land system could be left to take care of itself.

Mr. Ferguson would not confiscate existing ground-values, but would enable the town council to retain any future building-values, as well as to rate unoccupied land on its capital value.

A SPANISH IBSEN.

José Echegaray is presented to us by Mrs. Hannah Lynch as the Spanish dramatist of "the modern conscience, and its illimitable scope for reflection, for conflict, and temptation." The way in which the sins of the fathers are visited on their children is terribly emphasised by him. "We cannot with impunity corrupt the sources of life," says one of his characters:—

Not even Tolstoi, with all that delicacy and keenness of the Russian conscience, that profound seriousness which moves us so variously in his great books, has a nobler consciousness of the dignity of suffering and virtue than this Spanish dramatist. And not less capable is he of a jesting survey of life. Echegaray writes in no fever of passion, and wastes no talent on the niceties of art. The morality and discontent that float from the meditative North, have reached him in his home of sunshine and easy emotions, and his work is pervaded nobly by its spirit. And unlike Ibsen, he illuminates thought with sane and connected action.

OTHER ARTICLES.

"An Early Aspirant to the German Imperial Crown" is none other than the late Duke of Saxe-Coburg, whose liberal sympathies, popularity in Germany, and expected elevation to the supreme position in the general revulsion from Prussian and Austrian claims in the 'sixties are recounted by Karl Blind. It appears that the Duke once in 1860 invited Blind and other political exiles to meet him in Buckingham Palace. Caroline Holland describes how "the Banditti of Corsica" dominate the island, overruling the elections and terrorising the people.

One does not exactly see why such an article as Miss Julia Wedgwood's "Message of Israel" should have been published, except to show how a person who is not an expert may yet feel her way after her cherished beliefs amid the new results of Old Testament criticism.

THE NEW REVIEW.

THE October number does not exceed the average quality of contents. Mr. Harold Spender's plan of saving the House of Commons, which is the most important article, and Dr. Dunn's "Increase of Cancer" are noticed elsewhere. Mr. Leslie Stephen revives the memory of William Cobbett. Mrs. Lynn Linton, who writes in a calmer mood than usual, discusses the alternative of living in town or country, and concludes that the choice is between Life and Repose.

A NEW USE FOR THE BARREL ORGAN.

Sir Augustus Harris contributes a second group of notes and reminiscences of "Opera in England." He complains of the extreme conservatism of the British public in matters operatic:—

They take with great difficulty to a new work. The fact is, that in this Protestant country the music in our churches is far beneath the music in the Catholic places of worship, where from their earliest days children hear and get accustomed to music of the highest order, and thus are more ready to grasp and understand the works of the modern school. . . . There is a story told of the late E. T. Smith, who, when manager of Her Majesty's Opera House, used to engage barrel organs to play and popularise the tunes of an opera he was about to produce.

NINE DECISIVE MARRIAGES.

Mr. Spencer Walpole starts from the principle that "though the marriages of kings usually engage only a secondary attention, it may be safely stated that the decisive marriages of the world have had more influence on its fortunes than the decisive battles," and recalls the effects produced on English history by nine marriages—of Bertha, who won, and of Anne Boleyn, who lost, England for Rome, of Emma and Ethelred, of Matilda and Henry I., of Eleanor and Henry II., of Elizabeth and Henry VII., of Margaret and James IV. of Scotland, of William and Mary, of Sophia and the King of Bohemia. "English history would not have been what it is, nay, England herself would not have been what she is, if it had not been for these marriages."

A THREAT OF REVOLT.

Mr. S. T. Evans concludes his paper on "The Liberal party and the claims of Wales" with the following words, which are evidently intended to make any eating of the leak next session impossible:—

To threaten revolt is not pleasant, and perhaps not particularly dignified; but it would not be fair in this case to follow the proverb which says, "Never say you are going to do a thing until you have done it." It is surely better to state clearly and without equivocation that the representatives of Wales in Parliament must and will accept the responsibility which the situation will place upon them, unless next Session the Government are prepared to redeem their promises to the Welsh people.

CHOLERA AND TYPHOID.

Mr. Adophe Smith asking, "Are we prepared to resist a cholera epidemic?" makes the somewhat surprising announcement that

the drainage of the poorer property in England is fairly good, that of the slums in large cities is the best of all. Sanitary inspectors, amateur inspectors, slum explorers, philanthropists, missionaries, and many others are constantly prying into the dwellings of the poor; and though there is much surface-filth, any real organic defects are promptly detected and remedied. It is the middle-class dwellings, the houses rented at from £30 to £100 a year, that escape inspection, and that are often very badly drained.

Having observed the fact, namely, that cholera follows in the wake of typhoid fever he ventures to surmise that as in England we are not yet exempt from typhoid fever, we cannot consider ourselves safe from cholera

. . . There is no lack of hard drinkers in England. There is no lack, either, of misery, of overcrowding, of personal uncleanliness; and these constitute the culture ground of the cholera microbe. To save ourselves from cholera, we must cement a firm alliance between the social reformer and the sanitary reformer.

ARE WEATHER FORECASTS TRUSTWORTHY?

Mr. Robert H. Scott, of the meteorological department, endeavours to correct the popular impression of the inaccuracy of weather forecasts. He quotes statistics to show that in the thirteen years, 1879-1891, the forecasts for the various districts of the United Kingdom averaged a percentage of 45.5 entire, and 34.8 partial successes, against 6.6 entire, and 13.1 partial failures. The least successful districts are, in order of their figures, the West of Scotland, the South of Ireland, and then the North of Ireland and the North-west of England, ranking equally.

HOW TO TELL A LIFE STORY.

Mr. Leslie Stephen writes out of much experience of biographers and biographies, to protest against the style of biography that takes as its model the blue-book or the funeral oration. He pleads that "biography should once more be considered as a work of art: the aim should be the revelation, and, as much as possible the self-revelation, of a character." He observed that "letters in the main are the one essential to a thoroughly satisfactory life."

The Economic Journal.

THE September number of the *Economic Journal* presents a substantial bill of fare, in which the technical does not overpower the general human interest. The leading place is given to Mr. Goschen's address at the Annual Meeting of the British Economic Association. His recognition of the place of ethics in economics and of economics in ethics, seems likely to derive from his personal antecedents and official position a sort of epochal significance. Mr. Bear's formulation of problems for the new Royal Commission on Agriculture, Mr. Clem Edwards' history of Labour Federations, Mr. Ogilvie's Rise of the English Post Office, and Mr. Wolff's account of the French Agricultural Syndicates are referred to elsewhere. Caroline A. Foley, M.A., treats of Fashion as a factor in production and distribution. Fashion is an economic power perhaps too little dwelt on in the systematic exposition of the science; and there is a poetic fitness in a woman endeavouring to supply the lack.

Among other solid subjects of contemporary fame, the Silver Question naturally comes in for extensive treatment: one of the writers, Mr. Dana Horton, describing the issue of the order closing the Indian mints to silver as a veritable *coup d'état*.

In the *Westminster Review*, Mr. Charles Roper tells ghastly tales of the oppression East Anglian labourers suffer at the hands of gamekeepers and game-preserving magistrates. Another writer unfolds a new plan of distributing fish direct to consumers—the formation of a National Fish Supplying Company, pledged never to charge a penny more to the public than would provide for a fixed dividend and necessary reserve. Mr. Harry Davies writes on the Future of Wales, and on the strength of the eminence of Welsh preaching asserts that "There is, given due advantages, enough fire and enthusiasm in the Welsh nature to set the world ablaze in all the arts and sciences." Though so enthusiastic about the Welsh, he deplores not only England's neglect of Wales, but also the exclusiveness of the Welsh and their stubborn resistance to the English language.

THE NATIONAL REVIEW.

THE *National Review* is greatly exalted over the defeat of the Home Rule Bill by the Lords, but otherwise does not reach a very high pitch. Lord Ashbourne leads off with a psalm on the "Crowning Mercy." He winds up by asking,

What has been the feeling of the country on the rejection of the Bill? It appears to be genuine relief. There are no signs of sorrow or indignation. It is impossible to flog up a particle of enthusiasm against the House of Lords for doing what was expected by all, and hoped for by millions. Everyone feels that the Peers did their duty; and a growing majority of the people of Great Britain, and a growing minority of the inhabitants of Ireland, entirely approve their action.

WHICH SIDE DO YOUNG BLOODS PREFER?

"M. P." reviewing the personal aspects of the session, while eulogizing the Unionist leaders, and not withholding his admiration from "this miracle of enduring vitality," as he calls Mr. Gladstone, declares:—

Already, indeed, ambitious youth seems to be recoiling from Gladstonianism. Any observer in the galleries will be struck by this obvious difference between the Gladstonian and the Unionist benches. On the former he will see almost unbroken rows of elderly or middle-aged men; on the latter he will see a plentiful sprinkling of young men.

Sir George Baden-Powell laments the "barren labours" of the session.

A VERY FLAT CHAMBER.

Mrs. Crawford delineates the persons and parties and prospects of the new Chamber of Deputies. She opens with a very decided summary of the situation:—

The new French Legislature is one of very middling quality. Taking all in all, the governmental majority is perhaps the flattest ever elected since the Consulate—a government which sprang up when the guillotine had cleared away most of the heads that shed lustre on the National Assembly and Convention. Nearly every brilliant talent, of no matter what party, has been rejected by the electorate and regardless of past services.

VIA MEDIA ANGLICANA.

Rev. G. J. Cowley-Brown takes up the controversy on Ritualism where it was left in the *Contemporary* by Archdeacon Farrar and Canon Knox-Little, and implores both extremes to recognise the *Via Media* which the Church of England is meant to embody. He deplors that "an increase of scepticism is met by an increase of superstition:—"

Some who profess to speak in the name of the Church have required men to believe so much that now they will believe nothing. Questions of ceremony which bear nothing upon conduct are gravely debated, while people are debating and doubting the very existence of a God.

AN OLD HOUSE OR A NEW?

The gem of the number is undoubtedly Mr. Alfred Austin's "The Garden that I Love." The poetry is mentioned elsewhere. In recounting how he found his beloved garden, the poet thus breaks forth:—

I do not know how people consent, save under dire compulsion, to build a house for themselves or to live in one newly-built for them by others. For my part, I like to think that a long line of ancestors, either in blood or sentiment, have slept under the same roof, have trodden the same boards, have generally entertained under the same rafters, have passed through the same doors and up the same staircases, drunk out of the same cellars and eaten out of the same larders I now call mine. I like to think that I am not the first to bring life and death, sigh and laughter, merry-making and mourning, into a human habitation.

ASIATIC QUARTERLY REVIEW.

THIS review covers a signally wide range of interest, and contains a remarkable store of information along with a wealth of practical initiative. Mr. Arthur White's scheme for beginning "Britannic Confederation," and Dr. Leitner's suggestions on the Cow-killing Riots, are noticed elsewhere. So are General Forlong's account of Zoroastrianism as set forth in the Pahlavi Texts, and Mr. Le Maistre's prophecy of the speedy extinction of the Burmese. The Marquis of Lorne contributes a note on the outlook of the British East Africa Company, in which he says:—

A chartered British Company means, according to the present Government interpretation, a Company that the Government are chartered to encourage and desert, after hampering it to the utmost extent in their power by rendering its financial hopes ridiculous. . . . I hope it may not be necessary to repeat the little platform campaign of last winter to confirm the Government in the belief that East Africa must remain part and parcel of the British Empire.

SUGGESTED ALLIANCE OF INDIA AND CHINA.

Mr. Alexander Michie presses the point that—

The offensive alliance, or whatever it may be called, between France and Russia ought in reason to be met by a corresponding defensive alliance between India and China. There are men in China who see this, as there are men in India and England who see it. . . . But we suspect that India has so far proved the more backward of the two. . . . A noteworthy reawakening of China during the past twelve months should not escape our attention. . . . and it is interesting to see that the easternmost section of the Siberian railway has been opened to traffic in the same year that witnesses the completion of the Chinese line as far as the Great Wall. The broad facts stand out clear enough that Great Britain and China are at this very moment engaged in a common effort to save a friendly kingdom from being broken up.

The greatest obstacle to the projected alliance Mr. Michie finds in the personal policy of the leading statesmen on both sides. The Chinese leaders are bent on ousting foreigners. The English leader, "strong as Samson, as desperate and as blind," is bending his might to overturn "the pillars of his own house."

WAS ABYA A RACE-TERM?

Lord Chelmsford continues his reply to Mr. George Curzon's advocacy of a forward policy in Japan, and "An ex-Panjab Official" energetically denies that there is any treaty or promise obliging England to defend Herat against Russian aggression, or requiring the Amir to submit his foreign policy to ours. Mr. Charles Johnston argues from various ethnological phenomena to show that—

The Rajputs are a red race, neither Scythian nor Brahman; and are the direct descendants and successors of the Rājanyas Kshattriyas, or Warriors of Ancient India.

Whether they are Aryans also, is another question. "There is the strongest reason for doubting whether Arya was ever a race-term at all."

THE *Deutsche Rundschau* for September gives us a critical study of Fritz von Uhde and his pictures by Herman Grimm, who is of opinion that the gospels are not there to be illustrated, their contents raising them above the rank of pure imaginative literature. No one ought to be prevented from understanding the New Testament as he pleases, but nothing can be gained by painting pictures to represent the gospel stories in accordance with the newer readings. *Westermann* for October also contains an interesting study of Fritz von Uhde and his art, by F. H. Meissner.

THE ARENA.

THE September number falls considerably below the *Arena* average. B. O. Flower's "New Education and the Public Schools" has been elsewhere referred to. The inexpressible currency question claims no fewer than three articles all to itself. The second batch of "verdicts" by well-known writers on the "Bacon-Shakespeare case" contains five for, and one against Shakespeare's authorship.

A THEOSOPHIST ON SPIRITUALISM.

"Spiritualism," says Ella W. Wilcox in this number, "is merely the ante-room to the vast cathedral of the Wisdom religion." Apparently it is an ante-room where, on her showing, you are sure to meet with bad company and to run great risks. "To investigate spiritualism without the defensive knowledge which theosophy alone can give is as foolish as for a child to play with edged tools." These are the reasons:—

The dead who die in selfishness, avarice, and lust, and with the higher spiritual qualities dormant, hover about the borders of this astral world, and are eager to communicate with earth. The ignorant "investigator of the occult" not only retards their final spiritual progress by placing himself in reach of them, but he subjects himself to their evil influences. . . Besides these earth-bound spirits, the astral world or the one adjacent contains the "body of desire," which the spirit drops behind it in its upward flight, just as it dropped its body of clay in the grave. This "body of desire" contains a certain amount of memory and intelligence, which it received from the spirit during life, even after that spirit goes on about its business.

Hence arises the mixture of sense and absurdity in the messages which inquiring friends receive from it.

It is only the cast-off, baser part of your friend who is talking to you, actuated by a sort of automatic memory and a remnant of intelligence. Let it alone and it will decay. Fill it with the magnetism of mediums, and it will live on and on, but the mediums will lose health, morals, and reason.

THE "FOREIGN DEVIL" LOOSE IN JAPAN.

A terrible indictment is brought by Elizabeth A. Cheney in the September *Arena* against the consular courts in Japan. Under existing treaty-arrangements, Europeans or Americans charged with offences against Japanese must be tried before the consul of the Power to which they belong. According to the writer before us this simply means that the most abominable atrocities are committed by foreigners on the Japanese with impunity. The foreign tribunals apparently side with the foreigner, whatever his guilt. Here are some of the facts adduced:—

An American woman, a procuress, being unable to live in her own country, went to Japan. After she landed in Yokohama, about fifty young daughters of respectable families disappeared. Every one knows that the entire evidence is clearly against her; but judicial power being in the hands of foreigners, she has lived safely in Japan for over five years.

Again, the foreign roughs—mostly, perhaps, the sailors going to the public bathhouses on pretence of bathing—often forcibly break into the women's department, and attempt to outrage their persons. From this horrible indignity Japan gets no protection.

There is another case on record too horrible to relate here, and of which a normal imagination can barely conceive. It regards the treatment of a Japanese woman. Yet it is a fact, is known all over Japan, and the perpetrators of the deed remain unpunished.

These are but a few of the thousands of incidents of the application of the unjust treaty by which the judicial power of the Japanese is entirely ignored. Is the foreign hyena who preys upon the liberty and virtue of the women of Japan to escape, simply because foreign jurisdiction alone controls the decision of these cases?

These statements might seem incredible; but the Cantonment Blue Book just issued serves to remind us afresh of the scant regard which "Caucasian" officials pay to the legal rights of Eastern womanhood. No wonder that the question of treaty revision is uppermost in Japan.

THE NORTH AMERICAN REVIEW.

THE September number is predominantly political, but possesses beside much variety of interest. Ex-Speaker Reed, Mr. Carnegie, and Sir John Lubbock, discuss the silver crisis in the United States. The English and the French view of the Siamese question are set forth by Mr. Curzon and Madame Adam respectively, while Earl Donoughmore writes in support of the House of Lords' treatment of the Home Rule Bill.

Dealing with "Play-writing from the Actor's Point of View," Mr. W. H. Crane states that "there has never been so prolific a creation of manuscript plays as at present." "A manager of a city theatre is agreeably surprised on a day when he does not receive a new drama at his office." "It would not be a bad guess to assert that if fifty new plays are produced yearly on the American stage, ten thousand have been written and submitted during that period." He grants also that "many more really meritorious dramas are written."

THE FORUM.

THE *Forum* for September is a mine of solid and varied information. Its most sensational feature is Dr. McGlynn's revelation of episcopal intrigue in the Papal Church. This and other articles are noticed elsewhere.

Mr. E. M. Shepard extols "the Brooklyn idea in city government," by which is meant the investment of the mayor with a sort of modified municipal autocracy, the "deposit of sufficient or decisive power in the mayor alone." It "discards largely the principle of checks upon executive power." The mayor may without hindrance determine the entire *personnel* of the municipal administration, except in the finance and audit departments, and except in the uniformed police and fire forces, whose members are removable for cause only and after trial." The adoption of this principle is declared to be "the most important gain in municipal reform within our time."

Mr. M. B. Morton reminds us, in an article full of statistics, that the Southern States pay pensions to ex-Confederate soldiers to the amount of over a million dollars per annum.

President Harper, of Chicago University, finds the annual pay of American college professors to average \$1470—or about the yearly income of blacksmiths, brakesmen, railway conductors, and the like. Even German professors receive more in hard cash, while, if the relative cost of living be taken into account, they are twice as well off. Mr. Henry Irving describes his four favourite parts; and the inevitable silver crisis has two articles all to itself. Mr. O. W. Atwater has a very interesting article on the food waste of America, quotation from which I reserve until I have to deal with the waste of food in the series, "The Wasted Wealth of King Demos."

THE REVUE DES DEUX MONDES.

THE *Revue des Deux Mondes* for September contains an exceptional number of interesting articles. We have noticed elsewhere M. Bazin's account of the Italians of to-day, and M. Raffalovich's article on Criminal Berlin.

THE BRITISH WEST INDIES.

In the number for September 1st, M. de Varigny commences what promises to be an interesting series of articles on the West Indies. The author journeyed from New York to Hayti, thence to Jamaica, Cuba, and St. Domingo. He gives of Bermuda and the Bahamas satisfactory accounts. In a few words he gives an account of the orchid industry in the Bermudas. The three days spent between that portion of the West Indies and New York prevents any quantity of blossoms being exported; but an enormous trade is done in bulbs; in New York five to ten dollars is often paid for a fine orchid button-hole, and the wedding bouquet presented to the daughter of Mr. William Astor was entirely composed of white orchids, and cost £80. The soil of Bermuda seems specially adapted to the lily of the valley, whilst that of the Bahamas produces the finest bananas, oranges, citrons, tamarinds, and pineapples.

Under the title of "A Modern Prophet," M. Mille attempts to give a character sketch of Laurence Oliphant.

THE FRENCH ANTILLES.

In the following number M. Monchoisy deals with the French Antilles, Martinique, and Guadaloupe, where apparently the whole population is given over to the production of sugar and alcohol. Nowhere in France, remarks the writer of the article, will you find such religious fervour as in these two Colonial islands, where the clergy are treated with extreme deference and respect; Government officials walk in the religious processions, and in the villages the mayor will consult the curé before he will ask advice of headquarters. As in Ireland, the clergy seem to exercise a most salutary influence over the morals of their people; the priest is obeyed, but rather feared, for he is his own police and looks after the bodies and souls of his parishioners with an ever vigilant eye. The French Antilles keep the carnival in great state, the fêtes and masked balls beginning some six weeks before Lent, which is kept very strictly. The finest building in Guadaloupe is the cathedral, a splendid iron monument.

MEDIÆVAL CHEMISTRY.

A really interesting article, and which must have required an enormous amount of research, is M. Berthelot's on the "Chemistry of Antiquity and the Middle Ages." In it he shows that the science of the ancient world was ever associated with religion, were it only because its temples required a knowledge of geometry and mechanics, while the Greeks first imagined science as detached from the service of religion. Of the Middle Ages a number of manuscripts remain, giving many extraordinary recipes for the mixing and composing of chemicals. Italy seems specially rich in such lore. In the Library of St. Mark, Venice, is a volume copied about the year A.D. 1000 from an older work, and which is a veritable manual of Byzantine chemistry, treating of various metallic alloys, the moulding of bronze, and the method of dyeing chemically stuffs and skins. At Lucca is another manuscript, dating from the days of Charlemagne, and containing formulæ for the colouring of mosaics, writing in gold and silver, etc., etc. M. Berthelot has rendered himself master of his subject, and

has produced a valuable addition to the history of the Middle Ages.

IS A WOMAN A PERSON?

M. Fouillée's article on "The Physiology of the Sexes" cannot but have to English readers an old-fashioned ring. The first part is scientifically interesting, the second consists of a fine defence of the moral position and consequent moral equality of women. But it is somewhat late in the day to discuss the question as to whether or no women are persons, and possess their own personality, or exist exclusively for man's pleasure and advantage. M. Fouillée answers this in a striking and conclusive manner; which may be commended to those who have not yet reconciled themselves to the citizenship of woman.

THE NOUVELLE REVUE.

THE great feature of the *Nouvelle Revue* are the articles contributed by M. Behrs, Count Tolstoi's brother-in-law, on the family life of the Russian novelist. English readers, however, have already had an opportunity of reading the substance of M. Behrs's work in a volume published by him in London last year.

In the September numbers M. Jules Zeller, of the Institute, gives a stirring account of Luther's life up to middle age; and as he writes for a public which knows little and cares less for the Lutheran doctrine, he imparts his information with curious vigour and freshness. In England, Luther is regarded either as a spiritual hero or as a lamentable apostate. M. Zeller looks at him from neither of these points of view. He describes him as some erudite person of the twentieth century may describe Wesley or General Booth. But underlying his eloquent writing is the conviction that Luther went much further than he originally intended; and he argues on this point with a clearness which is all the more telling because he does not even allude to Luther's own marriage. The monk is presented to us as filled with early fervour in the cause of reform, and as gradually stripping himself of all his early conceptions of Christianity. Even in the heat of the battle he continued to say mass, and when he was finally excommunicated he was made miserable by being unable to go to confession. M. Zeller winds up his second article by the statement that not only the Catholic Church, but the Empire of Germany was threatened with destruction by the new wine put into old bottles. He leaves the reader with the sense that the civil powers suffered as much as the ecclesiastical; but he expresses no regret. It is this singular impartiality to which we English are quite unaccustomed which gives the articles historical freshness. He brings out Luther's mysticism, and the ultimate tendency of his intellect to exalt faith to the exclusion of work; and says that in matters of fact and science he remained full of the prejudices of times anterior to his own. "Doctors," said Luther, "who speak of our maladies as being due to natural causes, are ignoramuses who do not realise the power of the Devil." But hypnotism seems as if it were likely to vindicate Luther.

Mme. Anna de Lamperière gives a short vivid account of the Russian section of the Woman's Building at the World's Fair. The exhibits which have been arranged and organised by Princess Marie Wolkowsky and Mme. Alexandra Narischkine have been divided into two classes, the Industrial and the Artistic. The Tsarina, who took great interest in the section, contributed two large cases of Russian embroidery and real lace. In the same number, M. Gavillot replies to Baron Rieg's August attack on the Judicial Reforms of Egypt.

SOME ILLUSTRATED MAGAZINES.

The Woman at Home.

THIS is the title which Annie S. Swan has chosen for her new magazine (Hodder and Stoughton, 6d.) The contents as well as the title mark her intention to cater for women that stay at home, rather than those whose duties or tastes take them out into wider spheres. "It is no mean ambition, no easy task to essay," says the editress,

this provision of fireside reading for the "woman at home." The older I grow the more fervently and keenly do I feel the power and influence of woman in her own kingdom, and I would place the home unhesitatingly before the State, because it is the nursery of souls, and from it go forth the influences which, matured, guide the destinies of nations.

This self-imposed limitation naturally forbids measuring the venture by more exacting standards. What is distinctive about the new-comer is not the presence of any totally fresh or original elements, but rather the grouping of features which are found separately in many other varieties of periodical literature, but which have not been conjoined as here. The individuality of the magazine lies in the personality of the editress. The constituency which her books have already won for her shows how widely that personality has been appreciated.

As observed elsewhere a sketch of the Princess of Wales has the first place. A triplet of pretty stanzas by Norman Gale, a serio-comic tale of a Chinese butler by Mrs. Sarah Grand, an exchange of confidences between Madame Patti and her interviewer, Baroness von Zedlitz—all profusely illustrated—are among the principal items of attraction.

Harper's.

IN *Harper's* a copiously illustrated article on "Caravan Travel from Trebizond to Tabreez" is written and drawn by Edward Ford Weeks. "The Childhood of Jesus" is an attempt to reconstruct from intuition and analogy the story of the child and boy in his early years. It is illustrated by copies of Raphael's "Belle Jardinière," Murillo's "Holy Family," and other noted pictures. Mr. and Mrs. Pennell, under the title of "A French Town in Summer," sketch the out-of-door life of Toulouse. Colonel Dodge, in "Riders of Syria," rather undermines our traditional admiration for the Arab steed. He says:—

The exceptional Arabian is a fine fellow, but—and I think I can claim some experience, as I have seen and used horses in a great many parts of the world—apart from a certain attractiveness we readily grant him, I do not think that the best Arabian is nearly as good as the best hunter, the best trotter, the best racer, or the best saddle-horse of England or America.

Perhaps the most popular article will be that on "Undergraduate Life at Oxford," in which the doings and sayings of that curious product of civilisation is well and wittily sketched by an outsider. Noticed elsewhere are the articles on "Manifest Destiny" and "Witchcraft Superstition in Norfolk."

The Strand.

THE *Strand* has a somewhat belated article on White Lodge and Princess May and her family. Sherlock Holmes has duplicated himself, and now prosecutes his investigations in company with his brother; and in addition there is another story of the amateur detective type. The article on Sun-dials is pleasant reading. The sketch of Hamo Thornycroft receives notice elsewhere.

The English Illustrated.

THE *English Illustrated* gives a fine portrait of the new Governor-General of Canada, with a brief sketch. Lady Colin Campbell and Mrs. Lynn Linton indulge in strong words about the use of tobacco by women, Lady Colin advocating and Mrs. Linton shrilly denouncing it. Mr. Charles Lowe gossips about the Coburgs, and gives us portraits of the Dukes, past, present, and future. The double-page engraving of the Paymaster-General and two habitués of Monte Carlo is very striking.

The Idler.

THE *Idler* has the usual complement of fiction and amusing frivolity. Raymond Blathwayt discourses on Sir Charles Beresford, ashore and afloat. "A real hero," is Sir Charles' description of the engineer Benbow, who did a remarkable feat of engineering under fire, on the Gordon Relief expedition. This is what depended on it:—

If Benbow had not put that patch on the boiler, under countless difficulties and dangers, under a hot and continued fire, we must have been lost. Wilson's party must have been lost, and as has since transpired through Father Ohrwald and many Sheikhs from the Soudan (who were then fugitives in the Mahdi's camp), the whole of the little column at Metemneh would have been lost too, as the action at Wad-el-Habashi delayed the arrival of Nejjun and his army of 40,000 men.

The Pall Mall Magazine.

THE *Pall Mall Magazine* is exceedingly lavish of illustration, marked by varying degrees of merit. An etching of Kokarski's Marquise de Béarn, and an engraving of MacWhirter's "A View on the Tummel," carry off the palm. Pictures of the World's Fair buildings at Chicago are well executed, but appear somewhat late in the season. The solidest articles are two on the Bi-metallist controversy, in which Sir John Lubbock states the case for gold, and Mr. Vicary Gibbs the case for silver. The story of Sarawak is retold. Fiction, and not of the tamest order, is predominant.

The Century.

THERE are some fine portraits in the *Century*, notably one of Whitman in the "War-time." Castaigne's "Champs Elysées" is strikingly reproduced. Mr. W. L. Wyllie's pictures of "Plague in a Pleasure Boat" are impressive. Mr. Loeb supplies some admirable illustrations of work at the Pratt Institute, Brooklyn, to which fuller reference is made on another page. The diary of a fellow voyager of Bonaparte on his way to St. Helena, and "Walt Whitman's War Letters" are the chief distinctions of this excellent number, and they also, along with the amateur German tramp's experiences, find notice elsewhere.

Scribner.

FEATURES of this month's graphic art are "Glimpses of the French Illustrators," with examples of their work, and some fine sketches by Mr. Francis C. Jones of "Historic houses of Washington." Mr. Frederic Remington's portraits and groups of the North-west Mounted Police of Canada are very spirited. The principal article, by Mr. Howells, on "The Man of Letters as a Man of Business," is noted elsewhere. Mr. Robert Louis Stevenson's introduction to his grandfather Robert Stevenson's reminiscences of a voyage with Sir Walter Scott, in the "Lighthouse" yacht, has a curious interest of its own.

PRIZES FOR OCTOBER.

THE competition for the Calendars seems to be kept up in spirit by the various competitors, who take a great deal of pains in compiling their papers. The following is the order of merit this month:—

CALENDAR FOR AUGUST.

1. The Prize is won by Charles Douglas Rosling, Horwell Endowed School, St. Stephen-by-Launceston, Cornwall.
2. W. Culling Gaze, Fengate, Peterborough.
3. Miss Cécile Lambert, 27, Blenheim Crescent, W.
4. Miss Sarah Lukes, Clyton House, Par, Cornwall.
5. Miss N. Edwards, Park Farm House, Eltham, Kent.
6. "Veritas," 3, Avoca Terrace, Blackrock, Dublin.
7. Miss J. S. Keeling, Stapenhill, Burton-on-Trent.
8. George F. Wright, Ings Cottage, Burton-on-Humber.

The competition for the other prizes does not seem to be so brisk. For the five-guinea prize which I offered for the best paper upon "How to Improve Our Towns," several papers have been sent in. After careful consideration we have decided to divide the prize, giving three guineas to Albert E. Lander, of 62, Church Road, Croydon; and two guineas to "Civas," of Brighton, who did not give his address. The third in order of merit was Mr. J. S. Higham, Highfield, Accrington, Lancs.

The guinea prize for the best list of the most useful publications is won by Henry Williams, Hawthorn, Lavender Sweep, Clapham Common.

The guinea prize for the best short story is divided between Thomas Kensington, 6, Farm Bank Road, Sheffield, and "Seraphabel."

The papers sent in for the other competitions do not justify the award of the prizes.

A Catholic Social Scheme?

At the Catholic Truth Society Conference at Portsmouth last month there was talk of a new social scheme of Cardinal Vaughan's. It was said that the Cardinal had discovered a "Key to the Social Problem." But after his paper was read a priest was heard to observe that it was a splendid paper, but "where was the Key?" It was, however, a step in the right direction. Isolated priests and men and women have long been working at the social problem with little effect, but as yet the Pope's Encyclical on the Labour Question and Archbishop Ireland's recent trenchant speech have not resulted in any united action on the part of the bishops and clergy. That is still to come, and the sooner the better. A significant incident occurred on Tuesday. The Cardinal sat among the people, an appreciative listener, while the platform was occupied by a lady reading a paper on the "Catholic Letter and Literature Guild."

Our Father's Church.

MR. J. PAGE HOPPS has issued an encouraging little report as to the welcome which his suggestion of Our Father's Church has received in all parts of the world:—

About eighteen months ago, Our Father's Church sent forth its message. But the newspaper press has done most of the work of dissemination. By its help *The Ideal* has been laid before millions of readers in almost every part of the world. Besides this, many thousands of copies of *The Ideal* have been circulated in English and Italian. A German translation is in the press, and French, Spanish, and Welsh translations are in hand.

The result has been, not so much to attract a large number of confessed members, as to elicit a very remarkable agreement in favour of the principles of the church, and especially in favour of the conception of a church as a spiritual communion

of kindred spirits without external organisations, and of adherents without sectarian operations.

At present this seems to be the mission of Our Father's Church—to set forth this human and serviceable gospel—in the hope that every one may in time come to see that the truest church-work is the world's work, and that, to be a member of Our Father's Church anywhere is to do justice, to love mercy, and to walk humbly with our God.

Mrs. Besant's Church.

MRS. BESANT, who is publishing her autobiography in the *Weekly Sun*, last month referred to the aspirations in which she indulged with me in 1887, as to the foundation of a church based upon the service of man, and adds that she did not know then that the Elder Brothers had already formulated the principles on which this church should rest—the Theosophical Society to wit—to which it is the glory of her life to belong.

The Mission of the Music-hall.

DR. ANDREW WILSON tells in the *Humanitarian* how powerfully a rough music-hall audience in Newcastle was affected by the singing of "Home, Sweet Home," and other simple English ballads. From this and like experience elsewhere, he pleads with the directors of music-halls to give the ballad a fair chance. "Every succeeding visit to the music-hall" convinces him more and more that "it has a future before it as 'the people's concert room,'" and he argues for its educational value:—

When you can draw tears from rough eyes, and soften rough hearts with the simple song of long ago, you do wrong to neglect this source of education in the finer feelings, whereof the world to-day is none too full. . . . Are there not thousands and thousands of the younger generation growing up who have never heard what good old English, and Scottish, and Irish ballads are like at all? I plead for these thousands, quick, by reason of their inherited sympathy, to know and to feel what is good and true in the music of their land.

What is a First-class Game?

Is golf? That is the question Mr. Alfred Lyttelton considers in the *National Review*. He lays down what he considers to be the most salient among the true requisites of a first-class game. These are—

1. The vigorous and graceful employment of the highest bodily activities.
2. Sufficient luck to disturb scientific certainty.
3. Opportunity for judgment, nerve, temper, concentration, leadership, combination, *esprit de corps*.
4. Strokes affording sensuous pleasures.
5. The occurrence of frequent crises in which the highest skill evokes the highest skill.
6. A playground among pleasant surroundings.

He had previously "ascertained in every way" these requisites before applying them to golf. On application to it, however, he finds that "it is clear that in many important respects golf is found wanting." But all the same "a good game on a good links would tempt me now from almost any other sport."

THE story of the Amazon of Nice—Catarina Segurans—whose sudden valour saved, in 1543, the citadel of her native town from the all but victorious Turks, is vividly re-told in the *Leisure Hour*. The modern advance of woman seems to call for the construction of a Calendar of Heroines, from which our growing girlhood might claim old precedent for new ambitions. In such a calendar, the fifteenth of August—the day of her great achievement—may well be set apart to the memory of this brawny fisherman's daughter.

THE CHRONICLES OF THE CIVIC CHURCH.

CIVIC CHURCH OR FEDERAL CENTRE?

AT the Reunion Conference last month in Lucerne there was much discussion both before and after the delivery of the paper on the Civic Church, an abstract of which appeared in the September REVIEW. Broadly speaking, the result of the discussion may be summed up in one sentence. Every one agreed with the conception, and every one disagreed with the name. That is to say, the obvious advantage of having a Federal Centre in every community round which could be grouped all organisations which labour for the improvement of the condition of that community, commended itself to every one. But Mr. Price Hughes and one or two others who took a prominent part in the debate, were loud in their denunciation of the proposal to call this Federal Centre a Civic Church.

THE REV. HUGH PRICE HUGHES.

Mr. Price Hughes's argument amounted to this, that my idea of a church was based upon a radical misconception of the difference between the Christian Church and the Kingdom of God. The only excuse for me was that I erred in company with St. Augustine and of all those who followed his lead in this matter. The Kingdom of God is wide enough to include all those who take trouble to do good to their fellow-men. But the Church Militant, according to Mr. Price Hughes, is by no means composed of the same individuals as those who form the Church Triumphant above. The Church Triumphant above is composed of all those who belong to the Kingdom of God, whether they are in conscious relationship with our Lord or not. The Church Militant, however, is a select body, which is no more coterminous with the Kingdom of God than the Civil Service is coterminous with the Queen's subjects. Hence the term "Church" was declared at once to be too narrow and too sacred to be applied to the union of those who love for the service of those who suffer.

CARDINAL MANNING.

When long ago I was starting this movement, Cardinal Manning wrote to me, "Call it anything but a church and I will support you all I can; persist in calling it a church and neither I nor any of my people will do anything to help you." For my part I confess, whether it be owing to crass stupidity or to invincible ignorance, I cannot see the force of the distinction which is drawn between the church and the kingdom. I have always used the term the Church of God as if it were a synonym for the Kingdom of God. Hence, I held that those men and women constitute the Christian Church who in their various spheres are doing that which Christ would have done had He been in their place, whether or not they are in conscious personal relationship with Him.

All those who do any good in the world are doing it by virtue of the Grace of God. As no one can do good of himself, if any man does good to his fellow-creatures he must obviously do it by the influence of the Divine Spirit working through him, manifesting itself in

spite of his imperfections, and all those in whom the Spirit works are naturally and necessarily, so far as they are animated by the Divine Spirit, members of Christ, and therefore members of the mystic body of the Church.

CHRISTIAN IS THAT CHRISTIAN DOES.

Neither can I see the need of making so much difference between the consciousness and the unconsciousness of the creature through whom the Divine influence is transmitted. Every incandescent light that is switched on to the central main shows that it is united with that main, not by any consciousness on its part of any organic union with the main, but simply by the light shining through it and manifesting itself to the world. In this manner those who are the light of the world are those through whom the Divine light streams, and they are in organic union with the central main in so far as they manifest that light. Therefore the true way of finding out those who belong to the Church is to find out those who let the light shine through them in the divinely appointed way, of taking trouble to do good to their fellow-men. That is to say, those who live a life of self-sacrifice for the welfare of others are in Christ. If they do not they are out of Christ, and the question of the conscious personal relationship, although important, is quite subsidiary to the vital question as to whether or not the spirit of God shines through them, radiating their lives and making them the light of the world.

A RELUCTANT CONCESSION.

It would, however, be ridiculous to insist upon a label, however correct, if the result of insisting upon the accurate label were to defeat the object for which it was invented. That is to say, if the reunion of Christendom is to be brought about we must not stand on such pedantries as the right or wrong name for the association on the basis of which Christendom will be reunited, and therefore I am quite willing to substitute wherever possible the title of Federal Centre for that of Civic Church. But if any one asks me what this new institution is the centre of, I will reply it is the Federal Centre of the Civic Church. By which, of course, I understand all those people and associations that are willing to take trouble to make their fellow-men better, and to make the community in which they live more worthy of the Christian name. It will be interesting to see how far this condescending to brethren who are offended by the use of the term Church will lead to the multiplication of the Federal Centres.

Milk as a Beverage.

THE warfare against the public-house will not be undertaken in serious earnest until a glass of good fresh milk can be had as easily as a glass of beer. For hot weather there is no beverage so refreshing as cow milk. Yet in many districts it is as inaccessible as Nepenthe. In New York a dairy has been established on East River at the foot of Third Street, where the coalheavers consume immense quantities of milk at a penny a glass. The milk is sold at twopence per quart by a philanthropist. He also sells what he calls sterilised milk—that is to say, milk heated up to 158° is sold at threepence per quart for the use of infants.

PROGRESS TOWARDS FEDERATION.

THE movement towards federation seems to have considerable life in it at present, as will be seen from the following report of the progress which has been made in this direction:—

The earliest practical effort in recent years to secure the co-operation of all the Churches and other agencies in a federated effort to promote the general weal took place at Newcastle-on-Tyne. There was constituted in that city on April 21, 1890, what was called the Religious Conference. On this Conference every church and chapel in Newcastle and Gateshead has a right to be represented by three members. The Vicar of Newcastle was elected chairman, and the Conference contained representatives of Churchmen, Roman Catholics, Nonconformists, Jews, and Positivists. The Conference began its labours by organising a demonstration against gambling and betting, then it discussed the question of prostitution, and in the following year held a demonstration on the subject of temperance. The defect of this organisation was, that it was academic rather than executive, and confined itself to making occasional demonstrations. It did not attempt to undertake the duties of the Civic Church.

A similar organisation on almost identical lines was established at Liverpool, and with almost the same results.

In March, 1891, a Conference held in connection with the Association of Helpers at Bradford gave a stimulus to the idea of federated action.

The first Civic Centre to be formally constituted was at Glasgow. A Conference, presided over by the Lord Provost, was summoned by the Presbytery of the Established Church, and attended by representatives of all the other churches, and of many public and private institutions. It was decided to form a Social Questions Conference, which was publicly launched by Lord Rosebery, May 13, 1892. The following public bodies are represented on this Conference:—The Presbyteries of the Established, Free and United Presbyterian Churches; the Episcopal Church; three parochial boards; Merchants' House; Trades' House; the Landlords' Association; the House Factors' Association; the Trades' Council; the Charity Organisation Society; the Social Union; and the Ruskin Society. The following subjects were submitted for discussion in the order of urgency:—

1. The organisation of labour centres where work may be provided for all who are willing to work.
2. The housing of the poor and practical suggestions for the improvement of their dwellings.
3. How to provide rational and pleasant recreation for the citizens.
4. The condition of the class guilty of minor offences in relation to short terms of imprisonment.
5. How to put down vagrancy and rescue the children of vagrants.

Very useful and valuable reports were drawn up under these heads, and the Conference undertook last winter to organise popular concerts on a large scale.

The first Civic Centre to be constituted in England, and the only Civic Centre which calls itself by that name, was established at Brighton. The formation of this Centre dates from November 29th, 1891. It is constituted by representatives from the churches, chapels, trade unions, co-operative societies, friendly societies, and other organisations. Mr. George Jacob Holyoake is one

of the vice-presidents of the Brighton Civic Centre. The objects of the Centre were thus defined:—

1. Decrease of public-houses and enforcement of the laws concerning the liquor traffic.
2. Enforcement of the law against gambling.
3. Better lighting of back streets and slums.
4. Improved dwellings of artisans.
5. Public baths and washhouses.
6. Increased technical and moral education.
7. Shorter hours of labour and seats for shop assistants.
8. Free news-rooms.
9. Gymnasiums and swimming baths for boys and girls.
10. Open spaces and playgrounds for children.
11. Election of suitable persons for public bodies.
12. Strengthening the hands of the Vigilance Committee.
13. To secure shelters for flymen.

The minimum subscription is fixed at a shilling. The Committee meets once a month. It has been very active, and has brought constant pressure to bear upon the Town Council in the right direction. Mr. Holyoake, who is one of the oldest veterans in the work of social reform, recently remarked that he had never known any society that had made such rapid, such solid progress as the Brighton Civic Centre.

A Civic Centre was constituted at Cardiff on May 13, 1892, its object being declared to be to promote the social and moral well-being of the community. Its constitution defined its members as consisting of original sympathisers, ministers of religion, and elected members. A permanent committee of women only dealt with women's questions. The council meets quarterly. Its chief work has been the institution of dinners for starving children during the winter.

Conferences and public meetings were held to discuss the proposed Civic Church at Walsall, Wolverhampton, Swansea, Ipswich, Burnley, Bristol, and Middlesbrough, but owing to local causes the movement in these places did not pass beyond the initial stage of appointing a committee to consider and report.

The most notable advance in the direction of the Civic Church has been made at Manchester. The Social Questions Union was formally constituted on November 29, 1892. The Bishop is the President. Its members consist of any persons desirous of promoting the objects of the Union, who subscribe not less than one shilling a year to its funds; but their nominations must be approved by the Council. The objects of the Union were thus defined:—

To unite members of the various Christian communities and others, for the purpose of studying and taking united action upon questions affecting the moral and social well-being of the community, such as drunkenness, gambling, social impurity, and the condition of the people, and for the promotion of purer and happier conditions of social life generally.

The means by which these objects were to be obtained were thus defined:—

- (a) By obtaining all necessary information.
- (b) By informing and developing public opinion.
- (c) By putting existing social laws into operation, and promoting fresh legislation.
- (d) By co-operating with existing social organisations, and, if need be, initiating others.

The following committees were appointed:—(1) Temperance. (2) Gambling. (3) Social Purity. (4) Educational and Recreative. (5) Labour, and (6) Conditions of Home Life. The council meets once a quarter, and the reports of the committees show that most useful work has been done.

Another useful Civic Centre has been established at Rochdale. It is established on much the same lines as that in Manchester, but the Standing Committees are as follows:—(1) Housing of the Poor. (2) Police Court Mission. (3) Temperance. (4) Recreation. (5) Smoke Abatement. The President is the Mayor, and the Centre is working in hearty co-operation with the Town Council.

In Edinburgh the excellent Association for Improving the Condition of the Poor has for years anticipated several of the features of the Civic Church. But at the opening of this year an attempt was made to convert it into a Civic Centre. The hearty co-operation of the police and the city authorities was secured, but as yet the work is carried on on the old lines.

In the Old Swan, Liverpool, the Civic Church movement has led to the opening of a social centre in the disused police-station. An attempt to establish a similar social centre at Aintree, Liverpool, failed, owing to the indisposition of the local churches to respond to the generous offer of Mr. Hartley.

These form, so far as I am aware, all the successful attempts that have been made to constitute working Civic Centres on lines broader than that of Established or Free Churches.

The movement, however, has led to considerable activity in the direction of federation among the Free Churches. At Walsall, for instance, the attempt to found a Civic Centre broke down owing to differences about disestablishment, but a Nonconformist Council sprang from the ruins of the Civic Centre.

At Swansea the proposal to establish a Civic Centre resulted in the formation of a Christian Council, in which Churchmen and Dissenters met, but which did not include either Catholics, Unitarians, or Jews.

In London a Nonconformist Council has been in existence for a year or two. It issued a manifesto on the eve of the County Council Election, and meets periodically for the consideration of questions of public importance.

Birmingham, in February, 1893, decided to constitute a Nonconformist Council for the united consideration of moral, social, and religious questions. The executive committee is composed of four ministers and four laymen from the Wesleyans, Congregationalists, and Baptists, and one each from the Friends, Presbyterians, Primitive Methodists, United Methodists, New Connexion, and the Salvation Army. The Council is considering the taking of a religious census, and has held an important conference on the subject of juvenile prostitution.

There have been many Nonconformist Councils formed in other towns, but so far the movement has chiefly been confined to the Free Churches, with the exceptions noted above.

I conclude this hasty survey with a brief reference to the Council of Churches in Victoria, which was constituted in September, 1892, by the representatives of the Orthodox Protestant Churches. Its object is defined as that of giving opportunity for consultation and co-operation on matters affecting the religious, moral, and social interests of the community.

HOUSE-TO-HOUSE VISITATION.

THE Rev. Thomas Law, of Bradford, brought before the attention of the Reunion Conferences at Lucerne the fact that the most practical measure of reunion that had taken place in recent years had been the union of the Nonconformist Churches in certain large towns. In Bradford, Halifax, Birmingham, and Leeds, the Nonconformists have united for the purpose of making a thorough survey of the whole of the town in order to ascertain the extent to which the population attended church or chapel, and the children the Sunday-schools. Mr. Law gave a very interesting account of the house-to-house visitation which had taken place in Bradford. In that town all the Nonconformist bodies united, including the Unitarians. Every house was visited, and as a result the committee, which constituted a sort of Federal Centre so far as the Nonconformists were concerned, found that those who professed unbelief were very few and those who were indifferent were very many. They also found that both the publicans and the municipal employees complained that the nature of their vocations rendered it impossible for them to attend church. As the result of this visitation, a Nonconformist parochial system was established, each church being held responsible for the spiritual oversight of a certain number of houses in its vicinity.

In other towns the Unitarians have not been permitted to take part in the visitation. This limitation was defended by Mr. Price Hughes on the ground that while it was perfectly legitimate to accept the co-operation of the Unitarians in works of charity and philanthropy, it was not possible to accept that co-operation when the task in hand was such distinctly spiritual work as securing attendance at places of worship. This objection,

which was very strongly held by the Wesleyans, points to the desirability of eliminating from the objects of the house-to-house visitation anything that can be regarded as distinctively spiritual in this sense. At present, however, this is the first object and starting-point of the whole movement.

A house-to-house visitation has been made during last month in Leeds, where the effort has at least evoked an excellent spirit among the religious communities which have taken it up. What is to be hoped is that when the enumerators have finished their task the representative committee which has directed the visitation will take serious counsel as to the best way of remedying the evils which this census has brought to light. It is tolerably certain that any attempt to deal with them upon any basis less wide than the co-operation of all the men of goodwill in the whole town will not succeed. Not even the combined force of evangelical Nonconformity is sufficient, and hence it is possible that before long out of this movement may spring up Federal Centres which will form that much desired counterpart to the Town Council.

The chairman of that Centre, if he is adequately supported, will become the Angel of the town in which he exercises his functions, and it would not be surprising if we were to see the reunion of Christendom brought about by this revival of a real episcopate. Although in many cases the bishop or chairman of the Federal Centre would not be an ecclesiastic, and in some cases not even a professing Christian, he would have to be, what is much more important, a Christian in deed if not in word, and, as supervisor of all the churches and agencies for doing good, he would undoubtedly be in the true apostolic succession.

"ONLY A PENNY!"—A PRACTICAL SUGGESTION.

FOR some time it has been evident that the original conception of the Helpers' Association was too narrow. It has brought me into helpful contact with many valuable workers in various parts of the country. But, in the first place, those who are willing to help and are enrolled as Helpers find themselves in a position of isolation, and they do not know how many there may be who sympathise with them in their immediate neighbourhood. Secondly, many of them being poor men and women were not able to carry out any work that required any expenditure on their part. In the third place, the Association made no provision for those who wished to subscribe or those who were willing to enrol themselves, as ready to co-operate in case anything required to be done in the neighbourhood in which they lived. The work of the Helpers' Association has always been from the first to promote the union of those who love for the service of those who suffer, and it has taken as one of its first objects the humanising of the workhouses. Even this required money as well as time, and many who were in hearty sympathy with the object could not undertake the duty of Helper. Pondering these things in my mind, it occurred to me, when in Lucerne, that the time had arrived when it might be possible to establish a wider association upon a broader basis. On the last Sunday of the Reunion Conferences at Lucerne, I availed myself of the opportunity of setting forth the result of my cogitations to an open air meeting held under the trees in the grounds of Madame Merle D'Aubigné at the Gutsch. It was a beautiful Sunday afternoon, and representatives of both England and America, and of many sections of the Christian Church, were present at the closing meeting. After a preliminary exposition, chiefly autobiographical in its character, explaining what seemed to me to be the scriptural foundation of the Civic Church or Federal Centre, I spoke as follows:—

THE NEED FOR ORGANISATION.

I want to lay a practical proposal before you. It may not come to anything. No one can tell how many of the hundreds and thousands of acorns which fall from an oak will spring up and take root. I am going to plant a small acorn; I do not know if it will grow up. What I wish to ask you is, whether we could not discover some method which would enable each individual in the land to feel that he or she was being enabled to help on the great secular works of righteousness and mercy and justice and peace which so much need to be attended to? There have been several societies founded in the United States for this purpose which have had a great success. There has been no corresponding society founded in England. The societies to which I more particularly refer are Christian Endeavour Society, the Society of the King's Daughters, the Lend-a-hand Society, and some others. Do you think that there is room among all our multifarious societies for one, a National Civic Society, which would be as general as the Christian Endeavour Society, but which would not be limited by a sectarian title, and which would take as its object the doing of the six things which our Lord says will be the tests at the Day of Judgment?

WHY NOT A PENNY FELLOWSHIP?

The first thing we should have to settle would be its name. Mr. Hughes proposes that it should be called a Fellowship. I like the word fellow, because it is neutral. It is one of those words, of which we possess so few, which signifies either she or he. So does comrade, so does member, and so does fellow-servant. But on the whole I prefer fellow and fellowship. But instead of calling it a Civic Fellowship, I should like to have a name which would be a little more distinctive. A Civic Fellow! What is a Civic Fellow? I therefore propose to call the suggested association—if it is ever heard of again after this afternoon—"The Penny Fellowship," and I should like the badge of my association to be a penny, or if a penny be too large to hang on a watchchain we might substitute for it—in honour of the country in which we are holding this meeting—a tene centime piece. This is the reason why I propose the penny.

ONLY A CIGARETTE A DAY.

The time has gone past for declamation, and the time has come for organisation. We are all pretty well agreed about this, but how many of us are there that are agreed? How many of us in England, Scotland, Ireland, and America—for we speak particularly of the English-speaking peoples—are sufficiently in earnest to give up the cost of a cigarette a day for a systematic effort to do these secular works of mercy more generally and concertedly than has yet been done? Supposing that you pay the cost of a cigarette a day into the Fellowship funds, and that 100,000 persons did the same—do you know that the Fellowship would have an income of £150,000, which is five per cent. on three millions sterling? That is not available at present, but it is not for the want of the will, but for want of organisation. I cannot doubt that there are 100,000 persons who would not grudge the cost of a cigarette a day if they saw a chance of doing any good with it.

IF NOT PER DAY THEN PER WEEK.

The first objection, of course, comes from the people who are already pretty well milked dry by the perpetual and incessant appeals of their own charities and churches, until they shrug their shoulders and say "A penny a day: that is sevenpence a week," and so on. I don't know if any of you have ever learned to milk cows, but if you have you will know that if you don't strip a cow very dry she will go off her milk; and I have found that as a rule the more you make people give the more they are willing to give. But I do not propose to strip these good people of more than a penny a day, or I would even allow those who could not afford more to pay a penny a week. But it is the penny which is the distinctive thing.

WHO SHOULD BE FELLOWS?

But who would be eligible to subscribe the pennies? I propose that the Fellowship should be an association of all who love for the service of all who suffer. I would not limit it further than that. I do not ask him anything as to his creed: so long as he loves and subscribes his penny he is eligible for the Fellowship.

WHAT SHOULD THEY DO?

But you say how would they serve those who suffer? I would take the six heads which are Christ's tests on the last day. There are hungry people and thirsty people, and strangers, naked people, sick people, and people in prisons. I should divide those into the six categories, and I should say that the work of this Fellowship is to promote the union of all those who are trying to alleviate some of these miseries in their locality for the service of all who suffer. Hunger, thirst, hospitality to the stranger, clothing the naked, caring for the sick and visiting the prisoner. But you say, "Oh, people do that already." Some do, some do not. Take feeding the hungry, for instance. I think that the best practical method of working for the hungry is to throw more Christian zeal and energy into the election of our Boards of Guardians.

and to constantly appeal to the churches and other societies to get your best people to serve on the Boards and to act as visitors to the workhouse.

THE WORKHOUSE TEST.

I think that if England were to stand before the Judgment Seat to-morrow she would be asked more about her workhouses than as to the state of her churches and chapels. Here in our midst are gathered together a certain number of people who are very wretched and very miserable, many of whom are dwindling down to death, and will only leave those walls when they are carried to a pauper's grave. Could there be a position which ought to appeal more to all who bear the Christian name? But I believe that I am under the mark in saying that there does not exist a workhouse in any of our large towns in which there are sufficient visitors to afford all the patients five minutes' talk with one human being in the course of the week. I ciphered it out when I was in Manchester, with the master of the workhouse there. Merely to give the patients there five minutes' talk in the week would require more visitors than the churches and chapels of Manchester were capable of supplying. Let us define under each of these six heads what could be done.

I.—I WAS HUNGRY, AND YE FED ME.

For instance, in the feeding of the hungry, the first thing to do is to get to know who your Poor Law Guardian is. Of course we are hoping that the whole of the Poor Law administration will be redistributed, so that every one will know who his guardian is; but at present it is one of the most difficult things. Have you ever thought of the dumb pathos of the lists which are regularly nailed to church or chapel door to make public the names of those who have been nominated or of those who are eligible to vote for the guardians? It seems to be a mute appeal from the State to the Church, saying to every one of us, "Could you not get the best people elected?" Then there is the question of volunteering to visit and of showing a little kindly sympathy to the poor old people. I will give you one example from the letter which I have received from my sister. She writes describing the exquisite enjoyment afforded to some old people in Wandsworth Workhouse by a day in the park and tea at a gentleman's house. Now imagine that kind of thing done, not merely once or twice, but as a regular branch of church work. Do you not think that there would come a little of the joy of life into these people's hearts? You do not know what a workhouse is like until you have been inside one.

THE GOSPEL OF GOSSIP.

If a person came to me and asked me to advise him as to what he could do for the poor in the workhouse, I should not say, read the Bible to them, or read a sermon or distribute tracts, but—do not misunderstand me—go and "have a crack" with them. They are practically prisoners; many of them will not leave their beds until they die, and a kindly, genial person who would come in and have a talk would be one of the greatest blessings they could have. I was taught that lesson when I was only a few years old. I used to go and read to an old woman in a bye-street at Howdon. I did not like it; but my mother laid it on my soul, and so I used to read to her from the Bible and the *Appeal*. One day I remember, when I had finished reading, the old woman heaved a great sigh of relief, and said, "That's done! Now we will have a crack!" It taught me a lesson I have never forgotten. If you were to be put on a diet of tracts you would soon have indigestion. It is all very well to take a tract now and then, as a piece of the great outside world. Then it may be a spice. But you cannot dine off mustard altogether.

II.—I WAS THIRSTY, AND YE GAVE ME DRINK.

So much for hunger. Now about drink. The first thing to get to know is to ascertain where the ordinary person has a chance of getting a drink outside the public-house. At one time, in England in many places, a man would have had to walk a long way in order to get a drink of water. I have heard people groaning over the working-man. "Why does he

go to the public-house to get a drink?" they ask. The answer is easy. If the man has to walk half-a-mile to get a drink of water, it is very natural that he should go to the public-house which is close at hand. But it is not only water, for a man cannot drink only water alone; he requires something else occasionally. Now I think that I should begin to believe that the Christian Church has taken this matter to heart when in every town there is one good Temperance tavern or coffee-palace for every ten intemperance taverns that exist. But you say this is all material, this is all carnal. Well, gentlemen, we all unfortunately have stomachs, and I must say this, that you must all remember the time when out walking or bicycling in the country, that you would rather have seen a public-house than the most splendid cathedral in Christendom. Thirst is an imperious tyrant; you cannot argue with it. You must drink, and the ministering to this simple elementary need of mankind ought not to be left to the publican.

III.—I WAS A STRANGER, AND YE TOOK ME IN.

Now as regards hospitality. All of us here probably are in families; but there is a state of things which is enough to make a man, and still more a woman, feel as if they would like to curse God and die; and that is when they are living in a whole cityful of people there is no man or woman to speak to them or to whom they can speak. I believe that our Sunday-schools and our choirs have been more blessed as affording an opportunity for introducing people to each other than even they have been in teaching the Bible or in improving the singing. We often forget what a blessed matrimonial agency the Sunday-school has been. If two young men come up from the country, and one belongs to any organised form of Christianity and is sufficiently keen to go into the Sunday-school or the choir, that young man will soon have made friends on all sides, and will be rooted in human surroundings. But the other one, who never goes to the Sunday-school or into the choir, often the only girl to whom he can speak is the barmaid or a girl of the town. When the Bradford House to House Visitation took place, one of the people visited said he never went to chapel or church. When asked the reason, he said: "I went to church for six months, and nobody spoke to me during the whole time." Those who dispense fire-water would never have let that man come in and go out without shaking hands with him. That kind of thing is left to those who dispense the Water of Life. What we must do is to minister to the craving wants of human nature. Just consider what a desolate place London is for young girls and young fellows, and you will see what need there is to have a place, well lighted and well warmed, in which they could meet each other in friendly social intercourse.

IV.—NAKED, AND YE CLOTHED ME.

Then there is the question of clothing the naked. In Edinburgh the Society for Improving the Condition of the Poor and the police have clothed all the ragged and shoeless children that were to be found in the streets of the town. My friend Mr. Waugh thinks that the Edinburgh people are acting on wrong principles. But supposing our Lord Jesus should look down and see all the little ragged children running about the streets of Glasgow and Liverpool, and then look at Edinburgh and see all the children well and warmly clothed, I think it would take a good deal of arguing to convince Him that Glasgow and Liverpool were acting on more correct principles than Edinburgh. I am glad to see that they are introducing the same system into Birmingham. That is only a simple thing, and there is nothing original about it. But we want to get all the best things that already exist adopted everywhere.

V.—SICK, AND YE VISITED ME.

Then in the visiting the sick. That is recognised as such a common duty that it has been handed over to the Scripture reader or to some other kind person. It has become professional. If every church and chapel were to know all those who were sick, and invite any of its members to pay them friendly calls in order to show their interest in them and cheer their spirits, I think it would do a great deal of good. Of

course, I do not propose that you should let loose a rampant mob of churchmen and churchwomen upon a scarlet fever patient, but a good deal might be done short of that.

VI.—IN PRISON, AND YE CAME UNTO ME.

Then again as to prisons. They are fortunately not so numerous as they used to be in the olden times. But there are great difficulties, I am sorry to say, in visiting prisons. It is one of those things from which I am debarred, for no one who has been inside a gaol as a prisoner is allowed to visit them afterwards. But if ever you had had the good luck to have been in prison you would sympathise with the poor fellows who are there.

What I propose is that the Penny Fellowship should take united action in their own localities to do these six things. Do you think it is worth while trying?

A QUESTION BY COUNT TOLSTOI.

I was much impressed with one thing when I was staying with Count Tolstoi. One summer afternoon we had a long walk from his country seat towards the railway. When we reached it we found a gang of navvies getting their tea or something to eat in the afternoon. They were sitting outside their huts, and very miserable huts they were. They were only holes dug out of the hillside, with a few sleepers for a doorway, and in these huts these fellows slept. After Tolstoi had read them one of his little apologues, to which they listened attentively, one of them came up to him and said: "Do you think we could have a little straw to lie on?" "I will send you some straw at once," he answered. He walked for a hundred yards, muttering to himself, "On the bare earth! on the bare earth!" Then he turned to me and said, "You call yourself a Christian?" I replied, "Yes." "Where are you going to sleep to-night? You are going to sleep on a feather bed? How dare you sleep on a feather bed when these poor fellows have not a straw to sleep on! Do you think that Christ would have done so?"

WASTED WEALTH.

But his saying, although I do not accept it in its entirety, represents a great truth. Many of us who have been blessed with this world's gifts could minister a great deal more than we do at present to those who have them not, without impoverishing ourselves in the least or adding a penny to the cost of our living. I think there are many ways in which we could minister to our brothers without impoverishing ourselves. Every now and then I have an inclination—I do not know whether you would call it a temptation of the devil or an inspiration from on high—to give up everything and go and live in the slums. I have often thought that if I had been alone in the world I would have done it, but I have never seen my way to carrying it out. I am quite sure that I might have made greater use of the things with which I have been favoured than what I have done.

I.—BOOKS.

Take, for instance, books. Dr. Spence Watson, Chairman of the Newcastle Liberal Association, wrote to me once, saying, "When I get a good book I feel that it is a kind of sin to let it remain upon my bookshelves unused." You say, but books don't come back again. Well, suppose they don't; some do. Of course I do not ask you to send round your family Bible, or any book that you are constantly using in your daily work; but a book, which after you have read it, would remain upon your bookshelves unused, do you not think you might send it round? It might be announced in every church and chapel that if any young man or woman had no interesting books to read, Mr. So-and-So would communicate with those members of the congregation who have libraries, and by this means the whole of the libraries of the Christians of the place might be made useful to every one.

II.—CARRIAGES.

There is another thing which weighs upon me. That is a question for those who have horses and carriages. The principle to which I want to call your attention is this. There is a church in America which has a well-to-do congregation. They have a list at the church of all the people who have carriages and are willing to allow them to be used for the ailing and the sick. There are difficulties in the way of course. I would not like to trust my poor pony with every one who came to take her out for a drive. But it could be arranged. There are people who can drive. But how often our horses stand in the stable, sometimes week in and week out, without being used more than half an hour a day! People who keep carriages send their horses out to exercise them whether the carriage be empty or full. Why could not such persons be in communication with the churches and chapels in the neighbourhood, so that any sick or ailing person could have a drive? It would give an immense amount of pleasure.

III.—BICYCLES.

Take another question, and that is the question of bicycles. I have a couple of bicycles standing in my coachhouse at Wimbledon. I feel sadly that these bicycles are doing no good at present. How many young fellows in Wimbledon would be only too glad to have a ride on them! But there they stand, useless to any one. I can assure you these bicycles weigh a great deal heavier on my conscience than any of the heresies which were charged against me last week at the Conference.

IV.—GARDENS AND GROUNDS.

Then there are grounds. I have not a large garden, only about an acre. I cannot help feeling that we do not use that garden as much as Jesus Christ would have used it if He had been in my place. I think that there are many people to whom it would be a very great boon to sit underneath the trees. You can say they might go on to the common. But it is not the same thing.

V.—HOUSES.

Then again there is the question of the house. How many of us have houses which are comfortable, pleasant, and bright, and how many there are of those whom we know, educated people, gentlemanly people and ladylike people, to whom an opportunity of living in a house like that, while we are away from it, would be a very God-send! "Ah!" you say, "I do not dare to let them be in the house while I am away from it." But often those same people let their houses to total strangers. Do you not think we could do more in that direction? I maintain that all these things could be done. I think that if 100,000 persons in England would undertake to do these things, or some of these things, there would be a great deal more sweetness and love in England at the end of the year.

THE FELLOWSHIP FUND.

I think also there would be available a great fund for good works. I would expend the fund in many ways. I will only mention one small matter. I would use part of that fund for the endowment of charwomen. I think the endowment of charwomen would remove a great obstacle out of the way of a great deal of good work. Whenever you propose to use any church or any school-room for a secular service, people say, "Oh, they will make the place so dirty, we will have to pay the woman." That is only a very little thing. There are thousands of other things.

LOCAL FUNDS.

I should propose that the Fellows should be organised in towns and counties so that the funds which were raised in one district should also be spent in that district. If 100,000 persons gave the cost of a cigarette a day there would be a fund of £150,000 to do that work. I may be very optimistic, but I cannot help thinking it possible that we may yet succeed in raising up among all our churches and chapels 100,000 penny-a-day Fellows!

THE LANTERN AND THE PULPIT.

AN ENCOURAGING REPORT FROM AMERICA.

AT the Photographic Congress in America, the Rev. W. A. Patten, of Illinois, read a paper concerning the camera and the pulpit, in which he said several things which are worth while quoting here, for the encouragement of those who are somewhat timidly beginning to invoke the aid of what Dr. Patten calls "the servant of God, to render vivid and clear spiritual truth":—

The camera has received a hearty welcome into the studio, the manufactory, the school-room, the lodge-room. It has also received a like welcome in recent years into the church. Religion has its basis in history. It expresses its symbols in art. The earliest forms of architecture, as well as the highest expressions of art are religious in their motive. The temple became the repository of all that was most glorious in sculpture and painting. The history of the religions of mankind cannot well be studied without a knowledge of the monuments of past civilisations.

In recent years there has been a great advance in the study of archaeology. Here the camera has come in as a large factor.

In the teaching of the life and history of the church the pulpit cannot do without the camera. Christian art and archaeology go hand in hand. The inscriptions are best copied now by the camera. Many places there are where the use of the squeeze paper and brush are indispensable, but in most instances photography saves labour and accurately preserves the record. The work done by the Palestine Exploration Fund and the Egyptian Exploration Fund within the past twenty-five years has brought to light a vast lot of material whose richness and importance as contributions to the study of the religious life of these countries is simply inestimable. Thus the study of the Christian evidences from the standpoint of archaeology, the study of the religions of antiquity as preserved in their monuments, the study of the developments of Christian art as found in the catacombs and elsewhere, is rendered possible and exceedingly valuable by the rich fruits of the camera.

The Christian missionary to foreign fields now goes to his work armed with his camera and optical lantern. To reproduce a map, to illustrate the life of our Lord or the journey of his apostles, to bring before the people the manners and customs of Bible lands, the beam of light as a swift-winged messenger comes to his aid. In studying recently the book of Nehemiah and his great reform, during which he built up the dismantled walls of Jerusalem, discussion turned upon the course of the walls and the general topography of the city. From views taken on the spot with my own camera a few months ago it became possible to illustrate the subject in such a manner as to invest it with the utmost reality and vividness.

In the ordinary ministrations of the pulpit the camera is coming to be recognised. Under certain circumstances and on given occasions the use of the screen projection is assuredly a powerful adjunct. Its use may, of course, degenerate into a mere spectacular performance which is only a common show; but in proper hands beneficent and lasting results must certainly follow. A pastor in England affirms that through one of his illustrated sermons, delivered at various places, over three hundred persons had been roused to lead a better life. The illustrated sermon may have as real dignity and effectiveness as the illustrated volume, and be more impressive because of the added element of personality.

The existence in England of what is called the "lantern service" is well known. Illustrated themes are published and slides are borrowed. In this country the interest in this kind of work has greatly augmented within the last ten years. Some of our churches are now provided with apparatus for this purpose. One church recently built in Chicago has a laboratory for the manufacture of the glasses, and the pastor, who, it is needless to say, is a thoroughly live man, has great success in presenting the truth thus illustrated to his people. Another church, in Minneapolis, I believe, is provided with a screen,

lantern, etc., all at the control of the pastor by means of electric communications. If he desires while preaching to illustrate his subject, he may by pressing the respective buttons unroll the screen, turn out the lights, and signal the operator for the picture. What is more, in many of our theological schools may be found a complete optical outfit for the purpose of teaching Christian art, architecture, paleography, and the latest results in exploration and discovery in Bible lands.

All this serves to illustrate the statement that "science is the handmaid of religion," and none are so ready to acknowledge this as the Christian teachers. Many clergymen are expert amateur photographers, and are finding the camera a valuable adjunct in their work. It must not be understood that the illustrated sermon is in any sense to supersede the ordinary service of the church, but to find its place in specific lines, as above indicated. The church is more and more to use the camera—(1) to teach Christian art and archaeology; (2) in work in the foreign mission fields; (3) in the Sunday-school and normal work; (4) in special services to children; (5) in evangelistic services among the masses; (6) in providing a high class of instruction along the line of art and history.

A Girls' Seaside Camp.

LADY FLORENCE DIXIE describes in the *Modern Review* for this month an experiment which she made last year that might well be imitated elsewhere. A friend having given her £100 to be spent as she thought best among the poor, she decided to establish a seaside camp for girls. She hired three large bell tents and two marquees, besides some smaller square tents for use in bathing. A friend lent her his park, and supplied four boats for the use of the girls, each having a stout old fisherman in command. She then selected a uniform, a blue flannel jacket and scarlet knickerbockers and a straw hat. The wives of the fishermen looked after the girls, thirty of whom were soon established at the camp. The result was entirely successful; the girls stayed there for three weeks, and bathed, rowed, went picnics and generally romped round, doing all the duties of the camp, fetching and carrying wood and water and everything else. Lady Florence is very anxious to establish a permanent seaside camp for girls where the slave girls of London might have three weeks' outing every year.

The November Elections.

BEFORE the next number of THE REVIEW OF REVIEWS appears, the November elections will be over. I hope that our Helpers, and all those who sympathise with the general objects of THE REVIEW OF REVIEWS, will take care to impress upon any of the candidates who appeal for their suffrages the importance of providing adequate open spaces, parks, and playgrounds for the children of the towns where such open spaces do not at present exist. It would be also well, when mooted this subject, to suggest the advisability of establishing swings and gymnastic apparatus. A good deal may be done by judicious pressure exercised just before the election, and every citizen is responsible for using or neglecting to use the influence which an election brings within his reach. Any Helper who wishes to go into this question more thoroughly will find much useful information in the tenth annual report of the Metropolitan Public Gardens' Association, of 83, Lancaster Gate, London.

THE REUNION OF CHRISTENDOM.

THE Lucerne Conferences on the Reunion of Christendom have not terminated, as did those at Grindelwald without placing on record some tangible, practical declaration as to the end in view, and the best way thither. The Rev. Dr. Lunn, who has most wisely accepted an invitation to enter the Methodist Episcopal Church of America, has reason to congratulate himself upon the signatures which he has obtained to the following declaration:—

For many years the Home Reunion Society and the Christian Conference have been preparing the way for a more public discussion of the manifold divisions which impair the efficiency of the Church of Christ in English-speaking lands.

During the summer of 1892 a series of Conferences for this purpose was held at Grindelwald, attended by representatives of the most diverse schools of theological thought and ecclesiastical polity. Similar gatherings have been held during the present summer in Lucerne.

After long and careful consideration it has been decided to draw up a respectful address to all Christian men and women embodying suggestions which have resulted from the discussions of the Reunion Conference, and that this address should be signed by representatives of different Churches.

The propositions are as follows:—

I. The representatives of all branches of the Christian Church who were present at Grindelwald or Lucerne being agreed in believing that to preach Christ and Him crucified as the Divine Saviour of the world is the first duty of the Church and the Divinely appointed plan for the salvation of the world, were further convinced that this common end can be best attained by extending as much as possible the united action and the brotherly co-operation which already exist between branches of the Church on all subjects upon which they are agreed.

II. As a means of promoting such united action they would respectfully call the attention of Christian men everywhere to the following suggestions:

1. That the practice be adopted of setting apart one Sunday in the year for special services for the promotion of Christian unity, and that this practice be accompanied by

(a) An interchange of pulpits as far as it is practicable;

(b) The united attendance of all believers within any given district at Holy Communion;

(c) The delivery on the part of Christian ministers of at least one sermon in the year, calling attention to the good works of some other branch of the Church than their own, especially those whose many excellences are obscured from the observations of their fellow Christians by the prejudice and suspicion engendered by centuries of strife.

2. The representatives of the various branches of the Christian Church in any given locality might unite as they have united in such cities as Glasgow and Manchester to form a Social Union for the purpose of taking concerted and collective action for the promotion of those more social, philanthropic, and public objects of Christian endeavour, which can be most effectively dealt with by the co-operation of all Christians within any given area.

3. The examples of the various Missionary Societies in the Mission field might be followed with advantage at home in its respects.

(a) In the practice of a periodical conference between all Christian ministers in a district for purposes of counsel and encouragement, and

(b) In a concerted agreement between the representatives of the various denominations to discourage, in the face of the existing spiritual destitution of many districts, the waste of effort in overlapping of Christian agencies in districts already oversupplied with places of worship, and to promote whenever possible the concentration of Christian effort in strong organizations instead of frittering it away in the creation of weak societies.

Whit-Sunday, 1894, is recommended, where convenient, for the first "Reunion Sunday."

Here, at least, is something practical. Let those who believe in Reunion take these counsels to heart, and endeavour to give effect to them, each in their own district. Then something will at last get itself accomplished.

THE "CORRESPONDENCE CHURCH."

THE brief article published last month calling attention to the suggestion made by the Rev. Standen Holden in the *Daily Chronicle* as to the advantages that might accrue from the establishment of the Correspondence Church, has led to several communications being addressed to me. The writers for the most part cordially concur with the idea, and suggest various methods by which such a Church might be got into being. It seems to me that it would naturally be developed out of the fellowship which I suggested at Lucerne in the speech reported in the preceding pages. The members of that Penny Fellowship Society would form the natural basis for such a Church. I use the word Church in the sense in which it was used by Mr. Holden, who, by the bye, is a clergyman of the Church of England—that is to say, as an Association of men and women who are willing to help each other by mutual counsel. It is a practical attempt to realise the idea of fellowship which lay at the basis of the Christian Church. Mrs. Nolan Slaney, who some time ago organised the Catholic Letter Guild, and who is now, I am glad to say, assisting me in this department of the Review, assures me that her experience in working the Letter Guild, convinces her that not only is there a great need for such an organisation, but that it is perfectly practicable, and could be carried out without much difficulty. It is obvious that it would be much more efficiently carried out if it formed a branch of a daily paper; and in our Christmas Number I discuss at some length the way in which this department might be worked in connection with the Fellowship. I will not, therefore, at present, go further into the subject, beyond printing a few of the letters which I have received, and which certainly cover a tolerably wide range of suggestion:—

The Rev. Standen Holden, with whom the suggestion originally emanated, writes from Belstone, Redhill:—

We want at once a correspondence *centre*, and as many good front rank men of all opinions and creeds—able to counsel and able to help—from all the professions, as can be got. Some one too to read up the correspondence, circulate the matter into their various and requisite channels, and generally to organise and scheme for its widest publicity, scope, and constituency. He should be in touch with the London and Provincial Press, and keep all papers in employment for the service of the constituency. He should organise all over the country lectures and rendezvous, conversaziones, debates, etc., for the discussion, propagation, and ventilation of such subjects and principles as are for the good of the individual, municipality, and nation. The chief vehicle employed will be the penny post, and the press, daily and periodical. Such a scheme has been floating in my mind for years. I have watched, and joined even, various movements in hopes of seeing my ideal realised. But hitherto nothing precisely as I think is needed has been developed. I really do think and hope the greatest things from this. I do trust you are pushing the idea into corporate shape.

AN OFFER OF HELP.

Mr. C. E. Trower, writing from 1, Carlton Terrace, Redhill, says:—

I think the idea of a "Correspondence Church" a capital one, and if carried out it may be of great help to those who stand in need. I should like to suggest that the greater privacy the more likelihood of the advice being asked for, could it be arranged so that the one giving advice should not know to whom he is giving it. If a central office were established, this might, I think, be managed by each correspondent giving in a *nom de plume* to be registered, together with his

own name and address; he could then write the letter under the *nom de plume* and send it to the office, or direct to the one who was willing to give help, and who could then send to the office an answer addressed to the *nom de plume* given in the letter; the clerk, or one in charge, could add the proper name and address from his register and post on the letter. I should be very glad to see this put into working order. If a central office for the receipt and despatch of letters should be wanted I should be quite willing to give my services, provided the postage could be arranged for.

FROM A MATRIMONIAL POINT OF VIEW.

A Bachelor, Manchester, suggests that the Correspondence Church might be used for matrimonial purposes. He says:—

At no time in the history of our Christian Churches has more effort been put forth on behalf of our young men and maidens than to-day. And yet in that, which, next to the acceptance of salvation, is the most important step in life—the choice of wife and of husband—we are left as a vessel without a helmsman. And the result is, of course, shipwreck. "Marriage is an ordinance of God," wrote Taylor, but its right use is in our own hands. And too many, lacking counsel and direction, rush heedlessly into the married state, and find—horrible discovery—they have hopelessly blundered. And this is why so many thousands of us remain celibate. It is not because we do not want to marry. For we all believe, with Jeremy Taylor, that "a good wife is Heaven's last best gift to man;" but simply because we cannot meet with a girl who is sufficiently well credentialled. And the proposed Correspondence Church would seem an ideal creation to supply this need. In London, in Liverpool, in Manchester, and in Birmingham are thousand and tens of thousands of us earning our livings in the warehouses and shops, drawn from homes all over the country. Innumerable attachments spring up, but how can we learn about each other's antecedents? And ought marriages to take place without such knowledge? Others again, when at the seaside for their holidays, find themselves in similar positions. And would not the girl feel more secure in giving permission to the man to write to her, if she could privately ascertain that his life was good and all it should be? Ay, this is but reasonable. And why should not such an organisation exist, under the control of sober Christian men and women? Suppose I wished to become engaged to a girl working in the same shop with me in Manchester, but hailing from Reading. I know nothing of her past life, nor of her friends. I am not hankering after money; but I want to know if there is any family taint—insanity, for instance—that would preclude marriage. I forward a fee of, say 10s. (a fee would prevent mischievous use), to the Marriage Bureau of the Correspondence Church. The secretary (of necessity a minister in holy orders) writes to a brother Nonconformist at Reading and the vicar. He gives no names, but obtains the information I ask for, sends it to me, and destroys all the correspondence. I am amazed that some one has not helped in this direction before. The whole idea of the Correspondence Church is noble, and if you will add to its functions the performance of the duty which I have suggested, you will perform a service, the good effects of which will remain so long as we English are a people.

A YOUNG MAN'S DIFFICULTY.

Mr. Albert Louis Taylor, writing from 3, Peck Lane, Nottingham, states very lucidly the dilemma in which many find themselves:—

I do hope your Correspondence Church will get beyond a suggestion, for if properly organised and put in good working order it will do an enormous lot of good, and it is the thing wanted to-day more than ever. Speaking as a young man who takes a great interest in Herbert Spencer's, Max Müller's, Kuenen's, and similar works, I cannot help but feel the

inadequacy of the foundations on which the old faith is established when it is subjected to the critical examination, under which all truth ought to undergo, compared to the lucid manner in which the religious conceptions and progress of primitive man are depicted by our scientists. I feel that, to meet the requirements of our thinking young men and women, whose heartfelt desire is to be Christians, but whose conscience revolts against the old methods of interpretation of the Scriptures, that a Church or society such as you suggest would be the thing; for to most of our young men and women only two ways seem open, to be out-and-out Christians and accept all its old interpretations, in spite of their knowledge, or to give up all their Christian work, knowing they cannot conscientiously carry out all its commands and precepts. In organising the church or society, I think more than six persons will be necessary to do the correspondence, as the work will increase on becoming known. Would it not be wiser to form centres in nearly all towns, whose work would be to correspond to inquirers where possible in the town, and also to correspond with the leaders of the movement at headquarters, when unable to answer to satisfaction any inquirers? also to encourage the study of ancient religions and the sciences relating to them. To make known

the objects and work of the Church or society by pamphlets, etc., and, where possible, to give lectures and addresses in schools or missions, and for you to insert in *THE REVIEW* or *Reviews* reports of progress and suggestions, and to give names of persons willing to lend books or pamphlets which will in any way help on the work.

A Presbyterian minister at Edinburgh, who appears to have reached the age of the author of *Ecclesiastes*, writes me a curious letter, the refrain of which is vanity of vanity, all things are vanity—especially the idea that any good can be done by the Correspondence Church. Where the Roman Church has failed, he asks how any one else can hope to succeed—especially among Protestant Churches, which are but heaps of sand. But surely all life is but a series of failures and of rebeginnings, and the Roman Church has at least achieved a sufficient measure of success, when working in her sectarian limits, to justify a hope that some good might be done if a fellowship of Helpers could be founded on the broad foundation of the service of man.

SHOULD TIED HOUSES BE ABOLISHED?

A REJOINDER BY A SHAREHOLDER IN A COMPANY.

IT must be premised that the following remarks relate to London and its suburbs, where the practice of the trade differs somewhat from that in the country. It may be admitted that the Licensing Laws of England are not perfect, that they are capable of improvement, and that evils connected with the present system might be reformed. Such a desirable result is, however, more likely to be brought about by the facts of the case being correctly stated, and the question being more thoroughly understood, than is possible by reading such articles as the one by "A Friend," in the September number of *THE REVIEW OF REVIEWS*. The strongest indictment which "A Friend" can make against the present system is a selected quotation from a report of a Police Committee, dated in "the second decade of the present century." But let that pass. His view appears to be that if the large brewer could only be eradicated and the capital which he has embarked in his business destroyed by a stroke of the legislative pen, the drink trade would be established upon a satisfactory basis. Apparently he does not object to the trade itself, and takes it for granted that it can be carried on in a proper and legitimate way if the brewer has no hand in it. The publican when free from the brewer would be actuated by a desire "to regard the well-being of the nation and the health of his customers;" his prosperity is not to depend so much upon his supplying what the public demand, but upon his power to persuade his customers that they should drink a "glass of light wine" or "slightly alcoholised ale," he would not only become a guardian of the health of the community, but of its morals, for he would allow none but the good to refresh themselves at his counter. It is upon the brewer that "A Friend" pours all the vials of his wrath and accuses him of being the source of all evil. The brewer is in league with the magistrates, who will allow "the most disorderly and licentious conduct of the houses belonging to particular brewers," rather than inflict

any penalty by taking away the licence. He has by a "grinding monopoly" acquired absolute control over the publican; he compels him to sell "poisonous raw foreign spirits and adulterated beer," and "to have connived at, if not to have promoted illegal, disorderly, disgraceful, and sometimes even criminal conduct, among the frequenters of the retail drink shops." It is assumed that not only does no tenant or lessee ever take of his own free will a house the freehold or superior lease of which may happen to belong to a brewer, but if he should even buy a house in the open market and then go to a brewer for a loan wherewith to complete his purchase, he binds himself hand and foot in such a manner as to be for ever after a "veritable white slave," selling at the bidding of his master "the brewer."

Statements like these, being of a rhetorical character, may be left to take care of themselves, but there are some further statements of what purport to be facts, but are so opposed to the truth that it would not be right to leave them uncontradicted. One of these is summarised as follows: "The position to-day is that many thousands of public-houses are in the hands of men who have no money invested in the business to make them careful as to how the houses are conducted."

This is not true, at any rate in the district now referred to, which comprises a population about half as large again as Scotland or Ireland. It is the custom for a publican desiring to purchase a licensed house to make his own bargain for the same, and having done so to apply to his brewer for a loan on mortgage to enable him to complete the purchase. But the important point is that it is the all but universal practice for the purchaser to find a substantial part of the capital himself. The portion lent by the brewer amounts on an average to about sixty per cent. of the whole purchase money. It will thus be seen that the licence-holder, having himself a vital interest, has the strongest motive for the good conduct of his house. It is of course the understanding that so

long as the licensee is thus indebted to the brewer he will purchase his beer from him, but if the former has any cause for dissatisfaction with his brewer, he can, and frequently does, change his trade to another firm who will take up his mortgage. There are other cases where the freehold or superior lease belongs to the brewer, and it is usual in such cases to grant to the intending purchaser a long lease with a clause binding him to deal for beer only with that brewer. Here again the publican always has a large stake in the house, and is himself the direct sufferer if anything happens to diminish its value. The number of houses temporarily under management owing to the brewer having to foreclose his mortgage or for other reasons amounts to so small a percentage that it may practically be disregarded. It is not the case, as stated by "A Friend," that the publican having a loan from his brewer is charged "above the market price of the goods." No difference in price is made between such a customer and one who has no loan.

As regards the statement that the system "turns the retailers of drink into veritable white slaves, selling at the bidding of their masters, the brewers, poisonous raw foreign spirits and adulterated beer as the best quality of alcohol beverages": it is not the custom for the London brewer to supply his customers with anything except the beer which he brews himself. But that is a small matter compared with the statement as to adulterated beer; if there were a tittle of truth in this, it is obvious that no punishment could be sufficiently severe to mete out to such dealers.

It is difficult to tell whether "A Friend" means that the brewer supplies adulterated beer to his customers, or compels that customer to adulterate it in his own cellar. If he means the first, he cannot be well acquainted with the ways of an Exciseman in a brewery; of the rigid supervision exercised over the manufacture, from the time the raw material is taken on to the premises, till the finished product is on its way to the customer's cellar. If he means the latter, what has already been said of the freedom of the publican from dictation of the brewer would be sufficient answer. But further than that, what possible motive could the brewer have in wishing his beer to be adulterated by the publican? In what form could the brewer benefit by having his beer spoilt *after* he had sold it? Would he get a better price for it in future? Would it enhance his reputation? Would he sell more of it? It can only be blind prejudice which causes any one to attribute such a suicidal policy to an ordinarily prudent-minded man of business who has to meet competition at every turn in the quality of the article he manufactures, and who suffers heavy loss when by accident or mistake he cannot maintain the standard of his rivals in business. It is equivalent to saying that the brewer is not governed by motives of self-interest unless associated with trickery, fraud, and the demoralisation of his fellow-creatures.

According to the report of the Commissioners of Inland Revenue, it appears that beer is sometimes tampered with by certain publicans, but this is either by the addition of sugar or by dilution. The addition of either sugar or water, or both, to the beer by the publican after it leaves the brewery is an offence against the Excise, and not an adulteration in the popular sense. Sugar used in brewing is subject to duty, and if added by the publican the duty is evaded. The utmost care is taken by the Excise to detect such an offence, and if proved the publican is heavily fined. In this particular the interest of the brewer is certainly on the side of the

Excise, for his legitimate and duty-paid manufacture must be seriously interfered with by illegal and illegitimate competition.

If, as "A Friend" seems to imply, the publican is in the habit of adding *deleterious* substances to his beer, how is it that, notwithstanding the army of analysts employed by Somerset House and numerous public bodies throughout the country in the detection of such offences, prosecutions against publicans are so rarely heard of?

"A Friend" complains of the high, and, as he says, fictitious value attached to public-houses; but the value is real and has been caused by the State which, by a series of enactments, has created a monopoly. It is not the fault of the brewer that these licences were originally granted for no valuable consideration. On the contrary, the brewers have frequently pointed out the absurdity of this free gift to the original recipients, but these licences have repeatedly changed hands, and to punish the present holders for the error of the State would be scarcely equitable. But is the high value an evil? It at least imposes on all those having an interest in the maintenance of the licence a tremendous penalty for any infraction of the law, and what security for public order would the suggestion of a *personal* licence give which is not afforded by the present system? As it is now, the licence is always granted to a *person* before the business can be carried on in the licensed house.

It would not perhaps be irrelevant to ask where the justice would be of repudiating a brewer's loan to a publican while admitting that the publican himself should be enabled to meet all his other liabilities. How would it be possible to distinguish between money invested in a private loan direct to the publican, and money invested by a private person in a Brewery Company, and which through that channel becomes a brewer's loan to a publican?

It may well be doubted whether exaggerated mis-statements about the condition of things, and random rancorous accusations against classes and individuals effect any good result with whatever honesty of belief and intention they may be made. The probabilities are that they only lessen the influence of their authors and impair their authority in advocating really useful reforms.

THE FREE LITERATURE SOCIETY.

I would renew my appeal to my readers for literary lumber in the shape of illustrated papers and magazines of all kinds. A card to the Free Literary Society, Bouverie House, Salisbury Square, E.C., will bring a collector who will remove the parcel and distribute their contents to the Workhouses. I have to acknowledge a parcel from "Vulcan" of Leeds. A lady at Ealing writes me as follows:—

"Sir,—Seeing your appeal for literary lumber, suggests my telling you how much may be done by the younger members of a family for hospitals, etc., in the way of making 'illustrated picture books,' not 'scrap books.' The receipt is as follows: Take one number of any of the larger illustrated papers, say *Graphic*, or two, if there be not too many pages. Separate it into its sheets. Cut out and paste pictures from the comic papers, etc., all over the letterpress, i.e., on the pages alternating with the illustrated pages. Fold each sheet separately and pile them up one over the other; about a dozen sheets are enough, as the volume should not be too heavy. Then, with an awl and fine string fasten them all securely together. The cover is made with a thick sheet of brown paper, with coarse calico pasted either all over it, or a strip all round the edges and down the middle may be enough to prevent its tearing. This is then well sewn on to the sheets at the back.

THE PEERS AND KING DEMOS.

FURTHER CORRESPONDENCE, CRITICISMS AND SUGGESTIONS.

THE possibility of utilising the peers as counsellors of King Demos and leaders of our people into a new and better social era has occasioned much discussion, which, for the most part, has not found its way into print.

A DUKE'S DISSENT.

A well-known Duke sends me a private letter, from which I hope he will not object to the selection of the following extracts which set forth a view of the case, that is, to say the least, well worthy of attention.

First of all, is there not a little ambiguity in urging the word "Aristocracy" as synonymous with Peerage? There are many country gentlemen whose rent-rolls are as large and whose homes are as magnificent as those of their titled neighbours, and to whom, therefore, I presume you would wish your practical suggestions to extend. That premised, I proceed to say that I have much sympathy with your leading principle, which I understand to be the old one *noblesse oblige*. That, you rightly say, was the animating principle of Young England half a century ago, and I have never seen reason since to doubt its justice or wisdom; but when I come to discuss the various modes you suggest for its application we may not agree upon them all.

Under the head "The obligations of the Peers," my experience is that much which you think ought to be done is being, and has been for generations, done by them. Their picture galleries, their collections, their gardens and grounds are thrown open to all classes, and afford a fund of enjoyment, and, I hope, instruction, to what you call King Demos, whom, I venture to think, you idealise pretty considerably, and in places confuse with King Middle-class. Taking, then, his supposed wants as stated by you, I should say he either does not want, or is very foolish if he does want, the labourer to be settled on the land as he is in Belgium or Switzerland.

The experiment of small proprietorships is now being tried with, so far, scanty success; and, personally, I have found no willingness on the part of my small tenants to exchange their annual holdings for freeholds; nor, knowing something about the state of agriculture under the system of free imports, can I wonder at their decision.

Next comes "social equality." Therein I think you make a profound mistake. My experience convinces me that as political equality has advanced, so has social equality receded; and that by the wish, not of those on the upper, but of those on the lower rungs of the social ladder.

As to King Demos's boys and girls having a fair start in life, that I imagine they have now; and I don't see how the Peers, individually or collectively, can promote that object.

Then we come to the "demon of ecclesiastical arrogance," etc., and from all you say on that subject I dissent, *to the very end*, and desire not "to cut the comb of the country clergy," but to replenish, if it be possible, their empty purses. In your criticism of their conduct you appear to forget that by the immemorial Constitution of the country they are, and can't help being, the parsons or representative parsons of their parishes. The Constitution may, or may not, in that respect require revolutionising; but so long as it exists the clergy must fulfil the obligations it lays upon them, and I entertain a strong opinion that if they ever cease to occupy their present parochial position, King Demos will have no reason to rejoice at the change.

I return to the consideration of one or two of your other suggestions. For the reason I have given earlier, I don't think masters and matrons of workhouses, schoolmasters and schoolmistresses, etc., would care to mix in the society of what you call the Noble's castle, and if they did they would not represent King Demos; to carry out your primal idea the ploughmen and the

dairymaids should be invited. Public days at the Palace and the Castle have died out. I attended the last Lambeth Palace public day dinner fifty years ago, and I suspect that if any Peer attempted a revival, in however modest a way, of the custom, he would be denounced as an aristocrat apeing the conduct of bygone Barons, or laughed at as a mediæval dreamer. But in saying this I don't mean to dissent from your general proposition that the owners of great houses and ascertained standing in the counties may beneficially, from time to time, extend hospitality to some of the classes you enumerate. Indeed, in not a few instances that hospitality is now exercised.

In what you say as to mitigating the severity of the work-house to the veterans of toil, I concur; but as Peers have but little to do with the management of Poor Law relief now, and are likely to have still less under the new system about to be established, it is difficult to see how they can exercise any beneficial influence in that direction. It is notorious that in the Unions least under the control of the gentry the management is the strictest and most economical.

"THE COMBS OF THE COUNTRY CLERGY."

"A Country Clergyman," who writes me from the West Country, states, temperately enough, the theory upon which rests "the sacerdotal presumption and sectarian arrogance" to which I called the attention of the peers. There is, however, so much confusion of thought in his letter that it may be well to explain what I meant when I wished the peers to cut "the combs of the country clergy." Nothing was further from my thought than to suggest that a species of social persecution should be brought to bear upon High Church clergymen because they would not admit Nonconformist ministers to their pulpits. To begin with, the law forbids any such "recognition of the commission of the chapel minister;" therefore no clergyman could be blamed for refusing to break the law. It is not exchange of pulpits that is wanted, but exchange of civilities—a frank recognition not of Nonconformist "orders," but of the work and of the citizenship of Nonconformists themselves. "A Country Clergyman" says:—

We regard the dissenting communities as occupying a quite unjustifiable position, and one displeasing to Our Lord. It is not such a case of irregularity as might arise if men on a desert island appointed one of their number to minister to and for them.

It may be replied, that if a theory of the Church necessitates ministerial exclusiveness, it stands self-condemned. But any theory which regards the Church as a visible organisation necessitates this. If Our Lord appointed things in a certain way, it is not "charity and breadth," but disloyalty, to compromise the truth.

How is a clergyman holding this theory to recognise the ministerial commission of the chapel minister? You do not blame Romanists for acting on their principles. Why may not we believe in apostolical succession? I say nothing about the defects, very grave ones, which we believe to exist in the Nonconformist presentation of the Gospel of the Kingdom.

Surely my correspondent has gone out of his way to mistake the drift of my argument. No one objects to his believing in anything—however incredible it may appear to other men—provided his belief does not lead him to treat those other men as if they were not good citizens. His reference to Romanists enables me at once to bring our difference to a point. If the country clergy would

treat their Nonconformist brethren in their villages as Cardinal Manning habitually treated the Nonconformists of London, there would be no need to appeal to the peers to "cut their combs." "A Country Clergyman" cannot pretend that the Cardinal did not hold the doctrine of apostolic succession. Yet he found it easy to reconcile his High Church doctrines with a brotherly kindness and good feeling which many country parsons do not show. I hope my correspondent will understand me when I say that I ask for nothing more than that the peers may cut the combs of the country clergy in this respect to the pattern of Cardinal Manning.

THE EARL OF PEMBROKE.

The Earl of Pembroke sends me the following long and interesting letter on the general question:—

Dear Mr. Stead,—I was a good deal surprised to see my own name in the letter of a correspondent of yours, which I feel sure was not intended for publication—certainly not without suppression of names.

The kind things that your correspondent has seen fit to say about me oblige me to state that for reasons with which I need not trouble you, I should not think of claiming to be even up to the average of peers in the performance of public and neighbourly duties in my own locality.

The story about the man who knew the people well saying that the labourers in his part of the county would not believe anything coming from a man in the position of a peer requires correction in some small details. Lest my tenants should imagine that a new burden is likely to be added to agricultural distress, let me say that it is not to them that I am in the habit of delivering annual addresses on public subjects; and the speech in question was not about Home Rule—could any one in these days be reasonably expected to read a speech about Home Rule?—but on the scarcely more soluble problem of how rural labourers are to be provided with sufficient housing under present conditions and according to modern requirements.

But the story is in other respects a true one, and illustrates a side of the matter that is sometimes forgotten by people when they blame peers for trying so little to make use of the influence which it is supposed should belong to their position. In the present state of political opinion it is in some respects a positive disadvantage to a man who wishes to influence it to be a peer; and the feeling that this is the case acts as a discouragement.

It will be interesting to see whether this very natural outcome of democratic prejudice increases or diminishes as time goes on. I am inclined to think that there is so much kindly feeling of a personal sort towards the peers amongst the people, that if they will only go on doing their duty, and "keep pegging away," they will eventually obtain all the influence that their personal qualifications may entitle them to.

I did not originally intend to make any comments upon the article you kindly sent me; because it is difficult for a man to write about his own class, in the sense in which I should be inclined to write, without seeming to be trying to blow his own trumpet, or to excuse his own shortcomings. And I have already hinted that if this were really my object it would be my duty to spend much more ink upon the second than upon the first division of the subject.

But if your readers will kindly accept my assurance that anything I say has no reference to my own doings or omissions, I should like to remark that the two points that struck me chiefly on reading the article were: first, that much that is recommended in it as though it were novel or exceptional, is already the general rule to a much greater extent than the writer of the article seems to be aware, though not to such an extent as could be wished; secondly, that a good deal that is recommended in it which would be really novel is unfortunately also impracticable.

As regards the first point, so far as my knowledge of peers goes, it is the rule for them, as it was for their fathers before

them, to take an active and often a leading part in all kinds of county business, besides looking after their own estates, and presiding at those numerous meetings for all manner of objects which have become, so increasingly of late years, such a prominent feature of our provincial life. The men who attempt to shirk all such duties are really the rare exceptions. And such county and estate work does bring them, just as you wish, into personal contact with the staff of men and women who carry on in their various capacities the governing of the district in which they live.

How frankly the majority of the peers have accepted the new and democratic state of things is proved by the number of them who have offered themselves as candidates for their County Councils, and the leading part that they have taken in politics amongst the villages—conduct which generally meets with anything but approval from the enemies of their order. And I think I might claim that they have long ago proved themselves to be in sympathy with several of the present wants of King Demos that you enumerate. Before Education Acts were they built schools for the children on their estates, and in many cases training schools for the older girls as well; and it is really absurd to blame them for not instituting a general system of technical education, when they had neither the means to do it with, nor the power to use taxation for the purpose. If they have not instituted peasant proprietorship (and it must not be forgotten that the practicability of so doing has yet to be proved), they have at least led the way in the providing of allotments. And they have worked during the last fifty years, at their own expense, a real revolution in the housing of the agricultural labourer.

As regards hospitality, there are few peers I imagine who do not at least try to provide their neighbours of all classes with occasional opportunities of enjoying their beautiful parks and gardens. You seem to hold that the peers, of whom all these things could be said, are the exceptions. I believe that such exceptions are to be found in nearly every county in England.

It is true that my claims on their behalf fall somewhat short of your brilliant picture of what a peer might be and do; but that is, I think, because some things therein are hardly capable of realisation in fact. You quote with approval Carlyle's ideal of what a peer might be. He is to mould and manage everything and everybody on his estate till both his people and his dominion correspond to the ideal he has formed. Refractory subjects he is to banish (?); the relations between all classes, from the biggest farmer to the poorest orphan ploughboy, are to be under his control, and so on. It is odd that so thorough a democrat as yourself should not feel how out of date (if ever it was possible) such an ideal is now, how utterly inconsistent it is with the democratic spirit of our day. Imagine the just indignation of the banished and their friends, and the resentment of every one, from the highest to the lowest, at the landlord's interference in what they would consider their private business. A pretty pickle both the peer and his estate would soon be in if he set about his business in this spirit. There is much for him to do no doubt in the way of peacemaking, moderating, and assisting the oppressed, but his attitude must be that of a friendly counsellor, not of an autocrat.

I have much the same comment to make on your suggestion, that the peer is to save the Church by snubbing the parson into being more civil to the Nonconformist minister. Peers and landowners often do much, I don't doubt, in a quiet way to encourage a less hostile attitude towards the Nonconformist than some of the clergy are inclined to assume; but any attempt to dictate to the clergy on such a matter, even by the indirect means suggested, would be bitterly and rightly resented as an impertinence.

With regard to the exercise of personal hospitality to the classes you enumerate, who do the real work of governing the district, I will not deny that more might be done than is usually done; but even in this direction the limits of what is possible to all but most exceptional men and women are very definite. There is something very plausible and very attractive in the idea of making the big house the

centre of hospitality for the worthiest people of all classes and pursuits in the district, but it is not one that is easy to realise. Fêtes, garden parties, school feasts, county tenants' and servants' balls, are very well in their way, but do not go very far in the desired direction; and when the peer and his wife have established the habit of seeing all the people that you mention on their own business as occasion arises—the best of all ways of establishing personal relations with them—it is not easy to know what to do next. To invite them with no other object than to meet their host and each other, is open to the fatal objection that it will give them something the reverse of pleasure. If the peer were to invite the squire, the master and matron of the workhouse, the parson, the superintendent of police, the schoolmaster and schoolmistress, the doctor and the relieving officer, to meet under his roof for social enjoyment, he would only succeed in offending some of them and making them all constrained and miserable. The fact is that there is no people in the world among whom social class divisions of a certain kind are so marked as amongst the English, and especially in what are usually called the middle and lower classes. And these class distinctions of ours are very curious in kind—perhaps unique. They have nothing to do with politics; they imply no class hostility; they do not even militate against a deep sense of human equality, and a firm belief that Jack is as good as his master; they do not forbid the most cordial co-operation, or even the easiest and friendliest social intercourse at the proper time and place; but they *will not* allow (as the world is at present ordered) people whom they divide to meet for the sole purpose of social enjoyment at a *private* tea or dinner table. It is very absurd, no doubt, but if we want to do anything we must take facts and people as they are. Men and women there may be among the peerage of great social genius and personal magnetism who could make such gatherings succeed, but it is not fair to expect of a class what only an exceptional genius can accomplish; and I think most ordinary mortals among the peers will be wise to confine themselves to the more general and conventional forms of hospitality, and to the practice of holding themselves always ready to see any one who wishes to see them on business, or who requires their counsel or sympathy, with all the personal interest and kindness they may have at their command to bestow.

Let me say in conclusion that I agree in the main with the spirit and intention of your article. My only fear is that it will do harm by leading the public to believe that the peers as a body are far more remiss and behindhand than they really are. In so far as it may give a filip to a body of men who have great inducements to be idle, it can do nothing but good.

Yours faithfully

PEMBROKE.

Lord Pembroke thinks it ridiculous that Carlyle should have suggested the banishing of evil persons from the territory over which the peer exercises his authority. Why so? Surely Lord Pembroke is well aware that banishing, not of evil persons but of excellent citizens because of their political or religious faith, has constantly been resorted to on many estates. It is done quietly, no doubt, nowadays, for King Demos resents that kind of tyranny. But only the other day I heard quite by chance of a peer who refused to transfer the lease of one of his best tenants to that tenant's son, because the clergyman reported that the applicant did not support the church! And has Lord Pembroke never heard of decrees of banishment enforced against unfortunate girls, which were never put in force against the men who caused their fall?

FROM THE FARMER'S POINT OF VIEW.

As to Lord Cantelupe's outspoken letter, Lord Pembroke may be interested to see how it impressed so intelligent an observer as Mr. James Long, who in the *Farm Notes* in the *Manchester Guardian* states the farmer's view of the question as follows:—

Mr. Stead's remarkable article is one of the most conservative articles he has ever written. Now, those who live and

move among the rank and file of the farming class must be aware that the farmer is being gradually weaned, and solely by the force of circumstances, from his support of the land-owning classes. The labourer has his eyes open; but when the eyes of the Conservative farming classes have been opened equally wide there will be a terrible day of reckoning for those who have refused them help in the hour of trial. . . . The great landowner who speaks of his tenantry as his "men," as though we still lived in feudal times, just as he speaks of the vicar of the parish in which he resides as "my parson," is not likely to be over-tender in the proposition he makes for the tenantry of England. I have personally heard great landlords speak of their tenantry, men occupying large farms in which thousands have been invested, as farmers themselves may speak of the live stock on their farms. Lord Cantelupe, whose action is very much to be commended, and who deserves the sympathies of the people, appears to be one of the members of his order who plainly see the right side of the present state of affairs. He declares that the poor state of cultivation of much of our land is to a large extent due to the enormous size of many of our farms. I am glad to notice that he says he has always found that a small tenant keeps his land in far better condition and makes more out of it than a big tenant. I believe the principle is quite correct. He thinks that a man occupying 700 acres may, through want of capital, be quite unable to keep it all in high condition, whereas with 100 acres he might do very well. I would undertake to put my finger on hundreds of farms to which a similar remark would apply. It is morally impossible to find either the labour or the manure for the cultivation of a large acreage, whereas both can be supplied upon a small acreage with considerable facility. Men are not too proud to receive the rents paid by their tenants, but they are much too important to receive it first hand or even to make the acquaintance of the men who pay it. We can all name great landowners who spend the greater portion of their lives away from their estates, who do not personally know their tenants, and who never attend a rent audit. During the shooting season a portion of the estate may be traversed, but even then the tenantry are not recognised, and in some instances known to myself the tenants have not received a visit from their landlord during the whole of their many years' occupation.

A COUNTRY SQUIRE'S REMARK.

"A Country Squire" in Worcester sends the following significant hint, after reading the letters published in our last number. He says:—

These letters are all interesting. It is true that many of our greatest peers, who are also great landlords, live, for the greater part of the year, away from their country estates. It has ever been so, and probably will be so to the end. And it is a mistake to suppose that the country gentry wish it otherwise. They do not want to be entertained by these noble lords. Nor can they afford in these bad times to do much in the way of entertainment themselves. The truth is that these great noblemen belong to an unique class, and choose their friends from the class to which they belong. The families of gentlemen living in the neighbourhood of their country mansions are occasionally asked to dinner, or for a day's shooting, etc., but there is no freedom of intercourse between them. As the immortal Mr. Jorrocks of sporting renown observes, "where there's ceremony there's no friendship." Believe me, these big people are not missed. On the other hand, suppose these wealthy noblemen left London to live entirely in the country, in that event London would lose in a pecuniary way exactly in the same proportion that the country gained. London without the aristocracy would no longer rival Paris. The clock would be put back several centuries, and London would become, as of old, famous only as a resort for merchants.

And what would the poor rich lords do with themselves, shut up in their country houses? They have now as much shooting and hunting as they want, while living chiefly in London. Would they take to farming a portion of their large estates? I fear that they would only lose money, and gain nothing in other ways. We must, I really believe, accept the theory of Pope, that "whatever is, is best."

THE STORY OF A CRIME.—WHO IS THE CRIMINAL?

THE ADVENTURES OF THE ALBERT PALACE, BATTERSEA.

But Peter said, Ananias, why hath Satan filled thine heart to lie to the Holy Ghost, and to keep back part of the price of the land? Whiles it remained, was it not thine own? and after it was sold, was it not in thine own power? Why hast thou conceived this thing in thine heart? Thou hast not lied unto men, but unto God.

THE above text is one which kept recurring to my mind all the time I have been cudgelling my brains to find out why the Albert Palace has not been bought for the people. That it has not been bought is unfortunately too true, but why it has not been bought, no one can tell. There is something wrong somewhere, but nobody seems to know exactly where, yet the loss which is inflicted upon the community by the miscarriage of the well-meant plans of philanthropists and public bodies is a disaster, and whoever is responsible for it is guilty, however little he may know it, of a crime against the commonweal.

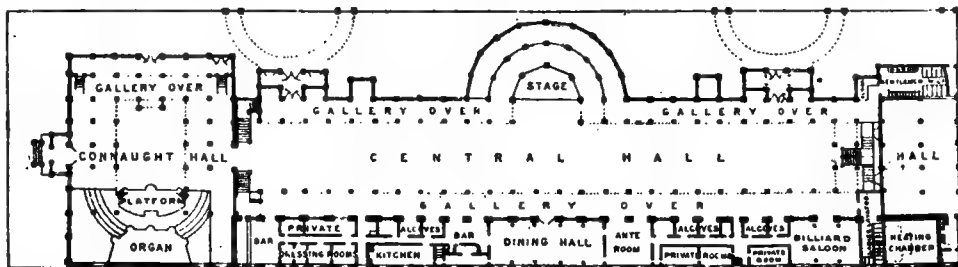

There are crimes and crimes. Some crimes are those which are committed by one individual against another. There are others committed by one individual against the community. The latter are often much more heinous than the former; but, as a rule, they are much less severely punished. One reason for this, no doubt, is that if one man assaults and blinds his neighbour, there is usually little difficulty in bringing home to the assailant his guilt; but when the injury is inflicted not upon Bill Jones or Tom Smith, but upon a whole community of Bill Joneses, it is difficult to bring the offence home to the perpetrator. Possibly enough the criminal is honestly unaware of the enormity of his crime, or even of the fact that he has injured his fellow-men. Sometimes, also, there is considerable confusion and uncertainty as to who the real criminal actually is. The crime may be patent, the misery which it has entailed may be only too obvious, but at the same time it is almost impossible to say who ought to be hanged.

Somebody ought to be hanged undoubtedly if the Albert Palace is lost to the public; but at present it seems to be as difficult to find out the right person to hand over to the executioner as it is to discover the nimble pea under the thimbles at the fair. Each of the parties concerned strenuously denies that he is the guilty person; each professes to be as earnest as ever they were in favour of securing the Palace, and yet, although the money had been all promised, and although Parliament legally undertook the responsibility—the Bill receiving the Royal assent—the Palace is lost to the public, and unless something is done, and that rapidly, to extract the Palace from the mass of confusion into which it has drifted, there seems to be no small risk that the whole scheme will fall to the ground, and an opportunity which has never before been offered to the public of south-west London will be sacrificed for them.

The story of the Albert Palace at Battersea is an illustration of a crime, or a blunder, which, fortunately, is not yet perpetrated, but may be consummated before

this month is out unless some prompt action is taken. The story is one of modern philanthropy. Rather a dingy romance, but still one which is full of interest. The Palace was built some years ago by some adventurous philanthropists who believed that if a Crystal Palace were established in the heart of London instead of being erected on the Southern heights, it could hardly fail to be a great success. Strong in this faith, they spent over £100,000 in building a palace of glass and iron, enclosing nearly three acres of land. In addition to a spacious Central Hall nearly a quarter of a mile in length, there is a great Music Hall, capable of seating five thousand persons, fitted up with organs which it cost over £5,000 to construct, and a Picture Gallery of four hundred feet in length, which experts declare to be the best gallery in London for purposes of displaying pictures to advantage. There are annexes also large enough for gymnasia for men and women and children, and refreshment-rooms, dining-rooms, lavatories, and all the conveniences of a roofed-in pleasure ground. The great Central Hall is surrounded by galleries which communicate with a balcony which commands an extensive and beautiful view over Battersea Park. No expense was spared to fit it up so as to make it the Crystal Palace of Battersea. Unfortunately, from causes into which it is unnecessary to enter, the Albert Palace never paid its expenses, and after struggling bravely for some years, the promoters gave up the enterprise, and put the buildings up to auction.

Up to this point there is nothing in the story more than the often-told tale of a well-meant attempt to provide a place of public entertainment and instruction which failed to pay its way. It was not until the effort was given up, and the property was offered for sale, that the mystery of the story comes in. The moment that it was announced that the Albert Palace was for sale, it was felt that it would be a sin and a shame to allow a building erected in the midst of so dense a population, dedicated to art, science and recreation, to be pulled down, if by any means it could be saved. Just about the same time also the Glasgow Association for Improving the Condition of the People had drawn up a strong report, calling attention to the immense need which existed in all great towns of providing some substitute for the parks in winter time. The committee in Glasgow had recommended the purchase of sites and the erection of large

A PLAN OF THE PALACE.

buildings in three of the most crowded districts of the city, which would serve the purpose of winter gardens; and this, they pointed out, was a natural and necessary corollary to the establishment of public parks. If a public park is necessary in summer time, then a winter garden is even more necessary in winter time and in wet and inclement weather. In our climate this means at least two-thirds of the year.

The proximity of the Albert Palace to Battersea Park naturally suggested the possibility of securing this building for a Winter Garden. Everybody agreed with this, and when it was announced that a building which had lost its builders more than £100,000, could be purchased outright and put into good condition for £22,000, every articulate person with an opportunity for utterance declared that it was quite obvious that the Palace must be secured. But to lose such an opportunity would be wanton wickedness, and all the constituted authorities and wealthy philanthropists were adjured to lose no time, but to buy up the Palace without delay.

But it so often happens that that which is everybody's business is nobody's business, and there seemed some possibility of the whole affair ending in smoke, when an announcement was suddenly made that a philanthropist, an anonymous philanthropist, had decided to come to the rescue, and contribute out of his resources no less than £10,000 towards the sum required to acquire the Palace for the benefit of the community. At first there was some scepticism. Philanthropists who are able to and willing to find £10,000 for public purposes are rare, and there are some who said of this anonymous philanthropist, as Betsy Prig said to Sarah Gamp, "I don't believe that there is no such person."

All doubt, however, on the subject seemed to be removed by a speech which was made by Mr. John Burns at Battersea Vestry, when he declared not only that this philanthropist was no myth, but a flesh-and-blood reality, with a balance at his bank, but had actually given him—John Burns—a signed cheque for £1,000 as an earnest of his determination to provide the money. Even the most sceptical admitted that there was something in it, and the word went round that Albert Palace was saved.

There was still, however, a good deal to be done before this desired end was actually achieved. Ten thousand pounds was not enough. The sum needed exceeded £20,000. Towards this, however, on the strength of the mysterious philanthropist, and the signed cheque in John Burns' pocket, the Battersea Vestry voted £5,000, and it was understood that Chelsea Vestry, just across the way, and Clapham Vestry, would also contribute of their means to the Albert Palace fund.

Everything seemed set fair, and all the world and his wife congratulated themselves upon the public spirit

which had produced such a philanthropist at the hour of need, and pleasantly chuckled over the prospect of having an ideal Winter Garden established in a great London centre, where they would be able to set the world an example of how to do it.

The County Council, of course, was appealed to, for it was not only necessary to raise the money to purchase the Palace, but after it was secured, an annual expenditure of nearly £5,000 was necessary. Now, £5,000 a year represents the interest upon a very much larger sum than the £22,000 needed to purchase the Palace; but Mr. Burns, with his enthusiasm, and backed up by the mysterious philanthropist with his £1,000, succeeded in overcoming all opposition.

THE GREAT ORGAN.

Mr. Hood Barrs, who from the first took a prominent part in saving the Palace, energetically seconded Mr. Burns. The press cordially supported the scheme, especially the *Weekly Times* and *Echo*, which pointed out in a very vigorous and cogent article the duty of acquiring the Palace. This article began by "wondering that the rich landlords and capitalists had been able to pass and re-pass the shut-up Palace without longing to buy it, and re-open it free for the recreative needs of the teeming districts." It rejoiced in the hope that this building was to be secured; but it announced that the mysterious philanthropist who had given the cheque of £1,000 to Mr. Burns was willing to give more than £10,000. This benefactor's offer and intention was to pay the whole cost of the building and the ground it stood upon, and to hand it over absolutely free to the London County Council, provided that the Council, in co-operation with the local authorities, would undertake to put it into repair,

and to dedicate it in perpetuity to the free use of the people of London.

The article concluded by declaring that these institutions were just what we have been asking for for years:—

They fill a need which is especially felt during the greater half of the year in London, and they will do more to soften the manners and brighten the leisure of our people than anything else that can be suggested. We want more social life in common, before the healthy social instinct will fully dominate our citizenship. We want the daily opportunity of the common enjoyment of the beauties of science and art and nature which are now the exclusive privilege of the wealthy, and no more eligible opportunity has ever offered itself of securing one big instalment of all this than the happy prospect now in view of acquiring the Albert Palace first for the benefit of Battersea and the adjacent districts, and next for the whole Metropolis.

Public admiration for this mysterious benefactor rose higher than ever, and with reason. Instead of limiting his offer to a miserable £10,000, he was willing to defray the whole cost, whether it was £12,000, £15,000, £30,000, or whatever it might be. Here, at least, was a man who was yearning for the welfare of the teeming population in the midst of which the shut-up Palace stood. Here

was a philanthropist with a bank balance as large as his heart; a man to whom a grateful community might well set up a statue in the Palace which his munificence had rescued from the hands of the destroyer.

Of course, there were various statements made as to this good man's identity. It was said that he bore a name familiar in the ears of Londoners as that of the proprietor and editor of a public newspaper; but it was understood that he was a man who did good by stealth, and blushed at the mere mention of fame, and, therefore, beyond envying the approval of a good conscience and the affluence which enabled him to gratify the desire of his heart, London did not inquire too closely into the matter, remembering the old adage about "not looking at the mouth of a gift horse."

On the strength of this understanding, the County Council introduced a special clause into their Bill, which they brought in last session. This clause was as follows:—

In this Act the expression "The Albert Palace" means the lands and buildings delineated on the plan thereof signed by William Coddington, the Chairman of the Committee of the House of Commons to whom the Bill for this Act was referred.

If the Albert Palace is granted and conveyed to the Council free of expense and freed and discharged from all incumbrances (the buildings, together with the organ therein, being in good repair and condition to the satisfaction of the Council), the Council may accept and hold for all the estate and interest therein of the grantors, and shall thereafter manage and maintain the same for the use and recreation of the public.

It shall be lawful for the Council after such grant and conveyance as aforesaid, and so far as the same shall vest in the Council the fee-simple of the Albert Palace free from incumbrances, to utilise and adapt the Albert Palace or portions thereof for the purposes of a museum, picture gallery or exhibition, or for a library, or for a reading, music or lecture room, or for a gymnasium or any like purpose, and to appoint officers for the care and management thereof; or for the Council to let on payment or otherwise, or use the Palace or any parts thereof for the purposes of meetings, lectures, entertainments, or such other purposes as the Council may think fit; and from time to time to make such reasonable charges for admission to the Albert Palace and on such occasions as the Council may think fit.

The meaning of this is perfectly plain. Without some such clause they would not have been authorised to undertake the responsibility, and to incur the expenditure necessary to keep the Palace open as a Winter Garden. Neither would they be allowed to charge any sum for admission in case popular concerts or other entertainments were given in the hall. It was expressly stated that this clause was under discussion; that it was for this purpose that the clause was introduced; and it was understood that this was entirely in accord with the wishes of the mysterious philanthropist.

The Bill containing this clause was printed and published in January, 1893. The clauses were framed by the draughtsman in order to meet what are believed

to be the views of the anonymous philanthropic donor. It was the opinion of the Parks Committee, or the lawyers of the Council, and of the Parliamentary draughtsmen, that these clauses were necessary to enable them to avail themselves of the philanthropic offer which had been made.

Everybody regarded the matter as settled. February passed, and March, and April, and May. During these months the Bill made its way through one House of Parliament, and then the other. All this time not a hint, not a whisper was heard as to any dissatisfaction on the part of the donor with the terms of the clause. At last the Bill received the Royal consent.

Up to this point everything went well, and then came the mystery. No sooner was the County Council placed in a position in which it could legally accept the offer of the mysterious donor, than that gentleman, for some undiscovered or unknown reason, went back on his promise, stopped the payment of the cheque which Mr. Burns had been carrying about in his pocket-book all the time, and refused to pay a single farthing of the £15,000 which had been promised, and on the faith of which the clause was secured in the Act of Parliament. The blank dismay with which this intimation was received can be imagined. The first impulse of every one was that of sheer incredulity. The sceptics roundly said that they had been right from the first, and that there was no such financier, and that he was all a bogus plant in order to gull the public. The Battersea Vestry, however, and the London County Council had been allured on to undertake expenditures on the faith of the existence of this anonymous

philanthropist, and could not so easily dismiss the subject.

The philanthropist in question when asked about it said that the County Council, by taking power to make a charge in the clause above mentioned for admission to the Palace, had departed from the scheme in support of which he had promised his money. When he was asked, however, if he objected to any charge being made for concerts and such like entertainments, he replied that nothing was further from his mind than to preclude the possibility of making such charges, as it was a vital part of his scheme that such entertainments should be provided.

What then, was asked, did he require? It was understood that he stated that he would be satisfied if there was an express undertaking given that no attempt would be made on the part of the County Council to exploit the Palace for the purpose of profit. As might have been expected, there was not the slightest difficulty in obtaining such an undertaking. An official order was at once dispatched, pointing out that by Act of Parliament they were precluded from abusing their position in the manner in which they feared, and undertaking that no such attempt would be made by them in the clause of the Act. Unfortunately, this communication seemed to have left the matter exactly

AN INTERIOR VIEW.

where it was, and the result is that to this day the philanthropist has locked up his cheque-book, and the Albert Palace is to be sacrificed, unless the London County Council, or some other philanthropist who will not change his mind when the time comes for fulfilling his promise, steps in the breach.

The question now arises, What is the explanation of this mystery? Who is to blame? Some one must be, and in the pursuit of some one upon whom the responsibility can be laid, the evidence seems to point in one of three different directions. It may be the fault of John Burns—but this, I confess, seems improbable, if, indeed, it is not entirely excluded by the admitted facts. No one for a moment questions the veracity of the Member for Battersea, and he has publicly and repeatedly stated that the promise was made, nor has any one ventured to deny it. But if the promise was made, how is it that the promise has not been kept? Excluding John Burns, therefore, we are shut up to two alternatives. Either it is the fault of the anonymous donor, or it is the fault of the London County Council. It would be the fault of the London County Council if in the plan they had proposed to use their funds for purposes of carrying out a scheme which was in direct opposition to the declared intentions of the donor, i.e., if they had declared their intention to convert the Palace into a ginshop or a tanyard, the philanthropist would undoubtedly have reason to refuse to subscribe the money which he had promised in the belief that the building was to be devoted to purposes of recreation. But we look in vain for the evidence that the London County Council has done anything of the kind. Of course they may have blundered, but no one can deny that it is honestly desirous of meeting the views of the philanthropist in question. The donor had six months during which he could have intimated his objection to the clauses, or any part of the clauses, in contravention of his ideas as to the utilisation of the Palace, and it was only when he appeared to be perfectly satisfied, preserving that silence which gives consent during all the stages of the Bill, that the Bill received Royal consent for passing through. If even now the philanthropist in question would be good enough to condescend upon particulars, and specify exactly what kind of clause it is that he wants, he could have it for the asking; but at present there seems to be no prospect of getting this simple matter arranged. As a result the public suffers.

Now, what is the explanation? Can it be that we have here a case of that double personality, which Robert Louis Stevenson made such use of in his famous story of Dr. Jekyll and Mr. Hyde? This explanation would enable the charitable to conclude that the money after all may be paid, and the Palace secured to the public. A donor, whom we will call Dr. Jekyll, was evidently honest, and desirous of benefiting the population of half-a-million which live in the immediate neighbourhood of the Albert Palace. In order to give effect to his wishes he publicly committed himself to a promise to subscribe all the money that was necessary to save the Palace for the people. How then is it that the Palace has not been saved? Is this not a case of a Mr. Hyde usurping the appearance and identity of Dr. Jekyll, and to dishonour the name and fame of his original? If so, we must all hope that Dr. Jekyll will assert himself speedily, and Mr. Hyde may no longer be allowed to play tricks with the good faith of a public benefactor.

In any case, even if Mr. Hyde should continue in perpetuity in possession of the bodily appearance of Dr. Jekyll, I earnestly hope that the London County

Council and the public will not allow the Palace to be sacrificed because of the double identity of a single individual. It would have been well, no doubt, if Dr. Jekyll could have carried out his benevolent designs without the interference of his *alter ego*, but if the worst should come to the worst, and we should have Mr. Hyde in permanence, let us hope that other philanthropists will come forward and save the Palace for the people.

BETTERING THE LOT OF WORKING WOMEN.

MISS EMILIE A. HOLYOAKE, Secretary of the Women's Trade-Union League, reviews the present "Industrial Position of Women" in the *Humanitarian*. Her general conclusion is that "the event which will most surely hasten the improvement in workshop and factory life is the appointment of women inspectors":—

It is to be hoped that, now we have women factory inspectors, we shall never in the future need to approach a Home Secretary with such grievances as reached Mr. Asquith's ears recently from workers in factories. Many of the complaints were in written documents, handed in unread, that they might not offend the ears of those present. Hundreds of women suffered daily from a state of things admitted to be too bad to be openly discussed; women are allowed by society to live under these conditions, but not to speak of them.

THE GOSPEL OF COOKERY.

Happily there are brighter stories to tell—of the care of employers and others for women at work:—

The great disadvantage to women employed in factories and workshops, is that they acquire no domestic tastes. . . . Young girls in factories need this deficiency in their education remedied, and it is to some extent being counteracted by the teaching of cooking in board schools.

The Honor Club for Working Girls, in Fitzroy Square (founded by Miss Honor Brooke), has this end in view. It gives working girls a place of meeting, and creates sociability among them, with opportunities of learning cooking and other useful arts: the special feature of the cooking is that it is such as would be required in a workman's home, and with only such utensils as would be found in a poor man's house. . . .

Colonel Ackroyd, of Ackroydon, near Huddersfield, set an example by building large rooms where the women could cook their food, and ladies at first went down to superintend the meals. Messrs. Cope, the cigarmakers of Liverpool, also gave their employées the advantage of large well-lighted workrooms, fitted with separate tables for workers. At this factory a woman was employed to teach the girls cooking, and fifty were taught at a time. . . . This fact caused the girls employed there to get married so readily that Mr. Cope stated it was a disadvantage to him.

FLOWERS, PICTURES AND AFTERNOON TEA.

Another example of workshops where the usual monotony is broken, and the girls have opportunity of having flowers around them, and pictures for the eye to rest on, in place of bare walls, is the Co-operative Wholesale Society's Boot and Shoe Works, in Leicester.

"The Ship," a workshop built by Messrs. Longman and Co. on Saffron Hill, is also mentioned:—

Afternoon tea is arranged for there, and the women and girls troop into a spacious dining-room, at the sound of a gong. At midday, dinner is cooked for the employées—some clubbing together for a small joint, and others having separate dishes. Besides the comfort of a large dining-room with comfortable seats, there is the great advantage that the work-rooms are being replenished with fresh air.

THE *Sentinel* for October publishes an analysis of the personnel of the Opium Commission, and also reports briefly the proceedings at the International Conference of the British and Continental Federation against the State Regulation of Vice, held at the Hague, Sept. 21-24.

THE NEW BOOKS OF THE MONTH.

NOTICE.—For the convenience of such of our readers as may live at a distance from a bookseller, any Book they may require, mentioned in the following List, will be forwarded post free to any part of the United Kingdom, from the Publishing Office of the REVIEW OF REVIEWS, 125, Fleet Street, on receipt of Postal Order for the published price of the Book ordered.

IN the first year of the present century a saint was born in England who died in 1882, after having given his name to a movement which transformed the Anglican Church. The task of writing his biography was undertaken by another saint, the most distinguished of the disciples of his school, who, after eight years' labour, fell by the way and died. Then the work passed into other hands, and is now being slowly carried out to its completion. The first saint was E. B. Pusey, a married saint, who owed probably more of his religious drift to his wife than to the Fathers of the Church. The second saint was H. P. Liddon, and the first half of the biography,* which was published last March, has been completed by the Rev. J. O. Johnston and the Rev. R. J. Wilson, who are now busy with the remaining volumes. The book is ponderous. The subject, although of fascinating interest to the ecclesiastic and the historian, is no longer possessed of much attraction for the ordinary man. Pusey and the Tractarians of sixty years ago played a great part in their time. But to us they are coming more and more every day to resemble the gigantic Saurians whose fossil remains are carefully preserved in museums of natural history. As we read this devout and scholarly tribute to the scholar and the saint whose name was for a whole generation the rallying cry of sectarian bitterness, we feel how entirely he was a man of another epoch. It is probable the interest will diminish rather than increase, for the heroic period of Dr. Pusey's life, the time of the Tracts, and the suspension, fell in the first half of the century, and are described in these volumes. The rest of his life was passed in times of much less storm and stress.

A very handsome volume† indeed is that in which Mr. Rowland Ward presents us with the latest adventures of Mr. F. C. Selous, the Nimrod of South Africa. Mr. Selous, who intended to have been at this moment lecturing in America, has been summoned to Mashonaland to defend the territory of the concession against Lobengula. The author of this delightful book was so recently the subject of a character sketch in these pages, that it is unnecessary to say more than that this latest book is worthy of his fame, and is produced in a style befitting the reputation of both author and publisher. It is more than a record of hunter's adventure. The concluding chapters tell modestly but lucidly the story of the occupation of Mashonaland. Mr. Selous was the guide of the pioneers, and the maker of the road by which they entered the country.

A much smaller book, but one which deals with much more important subjects than the embers of extinct con-

troversy or the vicissitudes of a Nimrod in Africa, is Dr. Goldwin Smith's "The United States."** This volume is a sketch by a master hand of the American Republic. It only professes to be an outline of the political history, but it gives more succinctly and vividly a picture of the rise and progress of the United States than any book of similar compass. Dr. Goldwin Smith is a brilliant writer, a philosophic observer, and a painstaking historian. He believes, as he tells us, that he "regards the American Commonwealth as the great achievement of his race, and looks forward to the voluntary reunion of the American branches of the race within its pale." Some day, possibly, he will see that the view of voluntary reunion of a world-encompassing race must be wider than a single continent. But he has done good service to the great cause by writing this handy, eloquent, and suggestive volume.

"His is a feeling about life which leads him to regard women as so many superfluous girls in a boys' game," said Mr. Henry James in a notable appreciation of Mr. Stevenson, which he contributed to one of the American magazines some years ago. And the majority of critics, always as ready to cavil at a man for what he has not, as to praise him for what he has, have joined in the cry: "Mr. Stevenson," they said in effect, "cannot draw a woman, cannot as a novelist enter into the passion of love." Gloriously are they answered, for his new book "Catriona"† contains two girl characters as loving and as charming as any in the fiction of Mr. Stevenson's contemporaries. Barbara Grant alone, the scheming Advocate's daughter, who works throughout the story for David Balfour's safety and happiness, should be enough with her delightfully winsome ways to make the fortune of a romance ten times less attractive than is "Catriona." "It is the fate of sequels to disappoint those who have waited for them," says Mr. Stevenson in his dedication; but he need have no fear: readers of "Kidnapped" have been eager for the redemption of his promise to continue the story of David Balfour's adventures. But even if they forget their delight in the keenest criticism they will find little in "Catriona" with which to be disappointed. It is true that the untoward ending of David's heroic endeavours to raise suspicion from and to save James Stewart of the Glens is a little bathetic, that this interest, with his after adventures in Holland with Catriona, make the book rather in two halves than in one complete and rounded whole, and that the David of the sequel is many years older, far more canny, than was the David who fled with Alan Breck through the heather. But when we consider the skill of characterisation, the wealth and variety of incident—there is no scene, by the way, as sensational as those by which "Kidnapped" is mostly remembered—and the charm of the

* "Life of Edward Bouverie Pusey, Doctor of Divinity, Canon of Christ Church, Regius Professor of Hebrew in the University of Oxford." By Henry Parry Liddon, D.D., D.C.L., LL.D., late Canon and Chancellor of St. Paul's. Edited and prepared for publication by the Rev. J. O. Johnston, M.A., Vicar of All Saints, Oxford, and the Rev. Robert J. Wilson, M.A., Warden of Keble College, Hon. Fellow and formerly Tutor of Merton College. Four volumes. (Longmans.) Vols. I. and II. With Portraits and Illustrations. 36s.

† "Travel and Adventure in South-East Africa. Being the narrative of the last eleven years spent by the author on the Zambesi and its tributaries; with an account of the Colonisation of Mashonaland and the Progress of the Gold Industry in that country." By Frederick Courteney Selous, C.M.Z.S., Gold Medalist of the Royal Geographical Society, Author of "A Hunter's Wanderings in Africa." (Rowland Ward and Co.) With numerous illustrations and map. 21s.

* "The United States: an Outline of Political History, 1492-1871." By Goldwin Smith, D.C.L. (Macmillan and Co.) 312 pp., 8s. 6d.

† "Catriona, a sequel to 'Kidnapped,' being Memoirs of the further Adventures of David Balfour at Home and Abroad; in which are set forth his Misfortunes anent the Appin Murder; his Troubles with Lord Advocate Grant; Captivity on the Bass Rock; Journey into Holland and France; and Singular Relations with James Moore Drummond and MacGregor, a Son of the notorious Rob Roy, and his Daughter, Catriona." Written by Himself, and now set forth by Robert Louis Stevenson. (Cassell.) Crown 8vo. Cloth. 7p. 371. 6s.

descriptions and the dialogues, one is content to praise almost entirely a story which, if it is not foremost, is yet in the front rank of Mr. Stevenson's romances. The characters of the wily Lord Advocate Grant and of James More Drummond will stand among his most notable successes; while Catriona Drummond herself is a character whom we shall continue to love as long as fiction holds delight.

One of the most handsome books which has been published this year is the "Memoir of Edward Calvert," which has just been issued by Messrs. Sampson Low. The volume is an imperial quarto, illustrated with thirty-one full-page plates and forty-one other illustrations, together with a portrait of the artist. The edition, which is limited to 350 copies, and is published at three guineas, is sumptuously got up and will do much to generalise the reputation which Calvert has long enjoyed among artists. Calvert was one of the friends of William Blake in his youth. In his latter days he devoted himself to classical subjects. He seems to have been in painting what Keats was in poetry,—an ancient Greek reincarnated in England at the beginning of the nineteenth century. The biography, which is written by his third son, tells the story of a long life more interesting to the artist than to the lover of adventure. There is added to the biography a second part devoted to the Principles of Art, taken from Calvert's notebooks. We have also notes and suggestions for the musical theory of colour. The chief attraction of the volume, however, is in the facsimile reproductions of Calvert's engravings. It is doubtful whether any more handsome book will be published this year.

BIOGRAPHY.

BELLASIS, EDWARD. *Memoirs of Mr. Serjeant Bellasis, 1800-1873.* (Burns and Oates.) Royal 8vo. Half leather. Pp. 215. 10s. 6d.

A very sumptuous biography illustrated with numerous photographic portraits of the Serjeant, his relations, and his friends. Serjeant Bellasis, although not one of the most conspicuous men of his day, nevertheless played some part in the Tractarian Movement of 1833, in connection wherewith he left papers of interest; and he was also an able, and for nearly a quarter of a century, a notable member of the Catholic body.

LINTON, W. J. *Life of John Greenleaf Whittier.* (Walter Scott.) Crown 8vo. Cloth. Pp. 202. 1s. 6d.

A volume of the Great Writers Series, including a bibliography by Mr. John P. Anderson of the British Museum.

Personal Recollections of Werner von Siemens. (Asher.) 8vo. Cloth. Pp. 416. 15s.

A volume of recollections of considerable personal and scientific interest. Werner Siemens besides being the head of the great firm of Siemens and Halske is, in his way, a scientific discoverer of importance. His services in developing the telegraphic system of Prussia and his discovery of the self-acting dynamo will be remembered by all interested in electricity, while some of the most interesting portions of the work are those in which he refers to the cable-layings in the Mediterranean and Red Seas, and between Ireland and the United States. The description of his early military career in the Prussian Artillery, where among other scientific discoveries he invented the processes of plating and gilding, and proposed and proved practicable the defence of harbours by means of submarine mines, to be fired by electricity, is well worth reading.

WATSON, JOHN, F.L.S. (Editor). *The Confessions of a Poacher.* (Leadenhall Press.) Paper Covers. 1s.

The poacher of these "Confessions" is no imaginary being; and Mr. Watson says in his editorial note that "he never met any man who was in closer sympathy with the wild creatures about him." The book is very fully illustrated by Mr. James West.

WHEATLEY, H. B., F.S.A. (Editor). *The Diary of Samuel Pepys, M.A., F.R.S. Volume II.* (George Bell and Sons.) 8vo. Cloth. Pp. 434. 10s. 6d.

The second volume of this very handsome and, for the first time, complete edition of Pepys' Diary. Mr. Wheatley has retained Lord Braybrooke's notes, but he has added many of his own, so that besides being the only complete edition the present is by far the most useful and the most convenient. The illustrations in this volume are portraits, reproduced in photogravure, of Sir Edward Montagu, Earl of Sandwich, K.G., Mrs. Pepys, and William Hewer.

ESSAYS, CRITICISMS AND BELLES-LETTRES.

GROSART, ALEXANDER B. (Editor). *"Thoughts that Breathe and Words that Burn," from the Writings of Francis Bacon, Baron of Verulam, Viscount St. Albans, and Lord High Chancellor of England.* (Elliot Stock.) 24mo. Cloth. Pp. 206. 3s. 6d.

Another of the delightful little volumes of the Elizabethan Library. Dr. Grosart protests the difficulty of indicating the wealth of Bacon's writings in so small a selection, but he seems to have chosen wisely, and his readers will carry away no faint idea of the supreme richness of Francis Bacon's work. The "Essays" have been drawn upon but sparingly, being better known to all classes of readers than the majority of the author's books. "A reader of Bacon," says Dr. Grosart in his short introduction, "must be prepared for a demand on the most strenuous intellectual effort of which he is capable if he would scale the heights, or plumb the depths, or explore the vast reaches of the thinking herein set before him."

MALORY, SIR THOMAS, KT. *Le Morte d'Arthur. Part II.* (J. M. Dent and Co.) 4to. Paper Covers. 2s. 6d. net.

The second part of the very beautiful edition of "Le Morte d'Arthur," which Mr. Aubrey Beardsley is illustrating with his wonderful decorations, designs, and initials, and for which Professor Rhys is to write an introduction.

TREVELYAN, MARIE. *Glimpses of Welsh Life and Character.* (John Hogg.) Crown 8vo. Cloth. Pp. 406. 6s.

With the object of awakening English interest in the land and life of the Cymru, Miss Trevelyan has endeavoured "to give glimpses, or faithful sketches, rather than studies of life and character in Wales."

FICTION.

ADAMS, E. C., M.A. *The Bow and the Sword: A Romance.* (Digby, Long and Co.) Crown 8vo. Cloth. 3s. 6d.

This is a story of the sixth century B.C., and deals with the adventures of Cambyse, father of Cyrus the Great. The tale is supposed to be read from cylinders discovered at Shushan. The romance is full of adventure of all kinds, with here and there a tinge of occultism, but only a tinge. The author takes his readers to Persia, Greece, and Egypt, and the allowance of blood-bell is sufficient even for those fastidious young cannibals of the nursery who insist on having their stories "buggy."

ALDEN, W. P. *Told by the Colonel.* (McClure.) Crown 8vo. Cloth. 3s. 6d.

Mr. Alden is one of the most humorous of all the American humorists, and the series of short stories originally "told by the Colonel" in the pages of the *Idler* and collected here have only one fault: they are too short, and there are too few of them. The original illustrations are reprinted.

BLACK, WILLIAM. *Sabina Zembra.* (Sampson Low.) Crown 8vo. Cloth. Pp. 509. 2s. 6d. New edition.

BLACKMORE, RICHARD DODDRIDGE. *Craddock Nowell: A Tale of the New Forest.* (Sampson Low.) Crown 8vo. Cloth. Pp. 461. 2s. 6d.

The second volume of the new and uniform edition of Mr. R. D. Blackmore's novels which Messrs. Sampson Low and Co. are publishing in a form similar, except in colour, to their editions of Mr. William Black and Mr. Thomas Hardy.

BRONTË, EMILY. *Wuthering Heights, AND ANNE BRONTË: Agnes Gray.* (J. M. Dent and Co.) Two volumes. Fcap. 8vo. Cloth. 5s. net.

The two new volumes of this charming edition of the novels of Charlotte, Emily, and Anne Brontë. If the present edition is exhausted, could not Messrs. Dent, in reprinting, arrange that the whole of "Wuthering Heights" should appear in one volume? A uniformity of thickness is not so desirable as to overweight the convenience of having the story in the single volume, and as the two books are not sold separately the purchaser would have no cause to complain of the thinness of the volume containing "Agnes Gray."

CRAWFORD, F. MARION. *The Children of the King: a Tale of Southern Italy, and Don Orsino.* (Macmillan.) Crown 8vo. Cloth. Pp. 320 and 430. 6s. each. New editions.

DELAND, MARGARET. *Mr. Tommy Dove, and Other Stories.* (Longmans.) Crown 8vo. Cloth. Pp. 288.

It is possible that the note of continual but never overstrained pathos in the short story that gives the name to this latest volume by the author of "John Ward, Poacher," may deter many readers from continuing what is certainly one of the cleverest and, in every sense, admirable collections of stories that has come from America since Miss Wilkins attracted the attention of the English reading public with her "Humble Romance." There is something of Miss Wilkins' touch in "Mr. Tommy Dove." Like many of her stories, it deals with the love of the middle-aged, but Miss Deland has infused her sketch with a sadness which has seldom its counterpart in Miss Wilkins' New England series. But the story is intensely natural, and one is hardly likely to forget the love that grew up for one another in the hearts of the middle-aged village apothecary and his old-maid patroness.

DICKENS, MARY ANGELA. *A More Cypher.* (Macmillan.) Crown 8vo. Cloth. Pp. 428. 3s. 6d. New edition.

DOWSON, ERNEST, and ARTHUR MOORE. A Comedy of Masks. (Heinemann.) Three volumes. 31s. 6d.

"It's all masks and dominoes: what does the form or colour of it matter?" says one of the characters in this uneventful story, in urging a wife to return to her husband who had lied to her, allowing her to think that her and his dearest friend had been the seducer of a girl who comes weeping to his house soon after his marriage. Philip Rainham, the friend who loving the wife had taken upon himself the burden of the husband's iniquity, is a well-drawn figure, but the other characters, with the exception of the prelate Charles Sylvester, are almost puppets; nor are they treated fairly by their creators, who give them important positions, place them in a train of circumstances of which at last one would like to hear the sequel, and then close the book without a reference to their success or failure. The disappointed artist Oxyyn, for instance, appears either too much or too little: as he stands he is but a character who was made a painter for the sake of variety; but he might well have been studied more carefully and with greater candour—the constant reference to his mysterious life is only wearisome. The book, in fact, is rather dull: it is not work-a-like; but the authors deserve some credit for their unconventional ending, in which they allow the wife to return to her husband to face the world and the future with "the mask of a smile and mourning in her heart."

DOYLE, A. CONAN. The Great Shadow and Beyond the City (J. W. Arrowsmith, Bristol.) Crown 8vo. Cloth. Pp. 320. 3s. 6d.

To those who have eagerly read every book that has come from Dr. Conan Doyle since the appearance of "A Study in Scarlet," the stories in this volume will not be new. "The Great Shadow" appeared as the Bristol Annual for last Christmas, and was praised somewhat enthusiastically in THE REVIEW OF REVIEWS at that time, while "Beyond the City" formed the Christmas number of *Good Words* two or three years ago. It is amusing; but Dr. Doyle can do so much better work than one is jealous of its commonplace. As an instance of his versatility, however, it is interesting, for it belongs to neither of the two classes of fiction with which his name is now associated. The volume, by the way, is bound with such an entire absence of taste that one almost grudges it a place with the rest of Dr. Doyle's works.

FYFE, H. HAMILTON. A Player's Tragedy. (A. D. Innes.) Paper Covers. 1s.

The hero of this story is an actor, who felt his part so strongly that it gradually overpowered him, rendered him incapable of remembering the facts of his life, and brought him to a state of madness in which the characters and incidents of the play he is acting in are the only realities. The idea is a novel one and it is well worked out; but Mr. Fyfe's characters are not alive, and his habit of interrupting the progress of his story while he delivers his opinion on sundry irrelevant matters is hardly pleasing.

HARDY, THOMAS. The Hand of Ethelberta: A Comedy in Chapters. (Sampson Low.) Crown 8vo. Cloth. Pp. 412. 2s. 6d.

The latest volume of the cheap and tasteful monthly reissue of those of Mr. Hardy's novels which Messrs. Sampson Low publish.

HARTE, BRET. Sally Dows, etc. (Chatto and Windus.) Crown 8vo. Cloth. Pp. 295. 3s. 6d.

Although the four stories in this volume will hardly rank with some of Mr. Bret Harte's earlier work, the book contains at least one character, that of Sally Dows herself, which for charm and winsomeness will be remembered with the best of his heroines. Miss Dows is a sort of Bathsheba Everdene. Alone in her southern State she had the strength of mind to adapt herself to the all real conditions which followed the disastrous War of the Rebellion, and to use her influence to make the blacks who had been her uncle's slaves return to the work which the war had stopped. The story commences with as vivid and real a scene from the war as has been written, but its action mainly takes place three years afterwards, when white race and black were gradually settling down and the whites were accepting as inevitable their changed relations. The story hardly hangs together, perhaps, for its exciting conclusion, in which the tracking of a black man through a swamp by bloodhounds is among the incidents, seems rather an afterthought, and not part of the original scheme; but it is very readable. The other three stories are far shorter: only one of them, "The Transformation of Buckeye Camp," shows Mr. Bret Harte at his best.

HAWTHORNE, NATHANIEL. Twice Told Tales. Second Series. (Warne.) Crown 8vo. Cloth. Pp. 374. 2s.

A volume of the Chandos Classics.

JAMES, CHARLES T. C. One Virtue: A Fiction. (A. and C. Black.) Crown 8vo. Cloth. Pp. 497. 6s. New edition.

JEFFERIES, RICHARD. Wood Magic: a Fable. (Longmans.) Crown 8vo. Cloth. Pp. 379. 3s. 6d. Silver Library.

A new edition of the charming story of the adventures of Bevis and his friends among the birds and beasts of the heather and the fells. Few books are better calculated to interest the young in natural history.

JEROME, JEROME K. Novel Notes. (The Leadenhall Press.) Crown 8vo. Cloth. Pp. 292. 3s. 6d.

These "Novel Notes" were so widely read in the *Idler*, where they have lately been appearing, that it is unnecessary to say more about them here than that they are perhaps the best work that Mr. Jerome has done, and that they are likely to please even those superior persons to whom he has ever been anathema. In fact, here and there is admirable writing and a faculty of invention which we would hardly have expected from the author of "Three Men in a Boat." The book is profusely illustrated by the *Idler* staff of artists.

LYSAGHT, SIDNEY ROYSE. The Marplot. (Macmillan.) Crown 8vo. Cloth. Pp. 425. 3s. 6d. New edition.

MITFORD, BERTRAM. The Gun-Runner: a Tale of Zululand. (Chatto and Windus.) Crown 8vo. Cloth. Pp. 359. 3s. 6d.

Mr. Mitford's new story comes with particular opportuneness at a moment when a possible war in South Africa is everywhere discussed. It is an intensely exciting story, as full of riot and bloodshed, fighting, and the horrors of savage warfare as anything that Mr. Rider Haggard ever wrote, and as the author writes from a fulness of experience—he knew personally the bulk of the Zulu chiefs and in lunas, including the King, who figure in his tale—the book has an interest over and above its interest as a mere story of adventure. Its incidents are mainly historical, and it is the kind of book that boys will have about.

OUIDA. A Dog of Flanders and Other Stories. Chatto and Windus.) Crown 8vo. Cloth. Pp. 293. 5s.

A new edition, uniform with the edition of "Bimbi," published last year, of one of Ouida's best known, best, and least meretricious books. The volume contains six illustrations by Mr. Edmund H. Garrett.

PHELPS, ELIZABETH STUART. Donald Maroy. (Heinemann.) Crown 8vo. Cloth. Pp. 282. 6s.

The authoress of "The Gates Ajar" has stepped from her accustomed paths in this brisk and amusing tale of American university life. How far the Harle of Miss Phelps's story resembles Yale and Harvard we do not know, but there is certainly a vast difference between it and our own universities. The book is crisply written and will well repay reading.

PRÆD, MRS. CAMPBELL. December Roses. (J. W. Arrowsmith, Bristol.) Paper Covers. 1s.

She was "a free, careless Bush girl," and she had promised to wait for him—"a romantic young Scotchman with a red beard and grave pathetic blue eyes, who reitell Longfellow and 'Childe Harold' in the intervals of musing cattle and shelling Indian corn." But her guardian interfered, and married her to a rich and brutish Englishman, who treated her so badly that, after ten years of misery, she had to get a divorce. And then she meets the Scotchman again, when he is on his way to meet his betrothed. The sequel is worth discovering—in a railway carriage.

SCOTT, SIR WALTER. Kenilworth. (A. and C. Black.) 8vo. Cloth. Pp. 473. 5s.

The ten illustrations in this new volume of the Dryburgh edition of the Waverley novels are by Mr. H. M. Paget.

SCOTT, SIR WALTER. Kenilworth. (J. C. Nimmo.) Two volumes. Crown 8vo. Cloth. 6s. each, net.

The Border Edition of Scott has now been running for twelve months. In another year it will be complete, and we shall have then one of the most worthy editions of any great novelist's works which have ever been published. Mr. Lang and Mr. Nimmo between them contrive to keep up the high standard of excellence with which the edition was inaugurated. "Kenilworth," which appeared on September 1st, is a story which lends itself well to illustration, and the twelve sketches which adorn these two volumes are all drawn and etched by Ad. Lalauze with true artistic expression, and a clear appreciation of the novelist's purpose. Mr. Andrew Lang, in his introductory essay, enters very fully into Scott's construction of the story and the truth about Amy Robsart, so far as the truth about her has been ascertained since "Kenilworth" was written. We advise all who want a good edition of Scott, if they have not already done so, to hurry up and subscribe for the Border Edition. "The Pirate" appeared in two volumes on October 1st.

SPENDER, MRS. J. KENT. A Strange Temptation. (Hutchinson.) Three volumes. 31s. 6d.

Does a conscience really exist? and, if it does, has it enough force and vitality to affect the happiness and even the action of a person healthy in body and mind, and quite unprepared by training for any ideas of either God or sin? This is the problem which Mrs. Kent Spender has tried to work out in the form of a story. Her heroine, Polly, in whom the power of conscience is tried, is a far more attractive and interesting character than the somewhat rigid Ralph Carlyon or the saintly Eleanor.

The Passing of a Mood. (T. Fisher Unwin.) Long fcap. 8vo. Paper Covers. Pp. 203. 1s. 6d.

The twenty-one sketches in this volume are, we believe, the work of contributions to the now defunct undergraduate journal, the *Cambridge Observer*, in whose pages they made their first appearance. Some one or two are very clever, an equal number are rather clever, one at least is exceedingly disagreeable, and the rest are rubbish; but the collection is worth reading if only to see what the modern young man, with a culture derived from a study of De Maupassant and contemporary French novelists, can do when he lets himself down to produce the work after which his soul yearns. In most cases the result is, not naturally, analysis run mad and clumsily treated wit.

WINTER, JOHN STRANGE. The Soul of the Bishop. (F. V. White.) Two volumes. 21s.

Forsaking for the moment the light chronicling of barrack-room stories and the romances of the garrison town, Mrs. Stannard has turned her attention to the theological novel. She has attempted to present in the character of her heroine "an attitude of mind which is very prevalent to-day," and which is mainly to be traced to a sense of the inconsistency of some of the Church's Articles of Religion and "the original Christianity which Christ Himself taught." Cecil

Constable, Mrs. Stannard's heroine, during her engagement to the Bishop of the diocese in which she lived, not unreasonably turned her attention somewhat more carefully to the doctrine of the Church in which, as a matter of course, she had from childhood worshipped. With terror she discovered, much as Mrs. Besant discovered, that there were things in the orthodox creed against which her common-sense revolted and which no tradition of faith could induce her to accept. Nor could her lover do more than temporarily still her questioning: the doubts reasserted themselves, and she came to the conclusion that she had no religious belief of any kind. Under these circumstances nothing was to be done but to break off her engagement with the man whom she loved with her whole heart and who loved her with the strength and constancy which so often comes with middle-age. And so were the two lives blighted: Ceilidh by reason of the doubts first instilled into her mind by the inconsistencies and unjust teaching of the Thirty-nine Articles; the Bishop's by his great loss and the disappointment of all his hopes. The story is not ill-written, and it contains plenty of pages of theological discussion.

ZANGWILL, I. *Ghetto Tragedies*. (McClure.) 18mo. Parchment. Pp. 236. 1s. net.

There can be no question, with this volume and "Children of the Ghetto," from which to judge, that Mr. Zangwill's true forte is not so much in the humorous story as in the treatment of Jewish life and character. He combines a meretricious but effective style with an unusual power of characterisation and of dramatic intensity, and there is not one of these four poignant and original sketches which do not show the hand of the artist. Mr. Zangwill is at present the supreme delineator of the picturesque East-end Jew. Taking for his subject a class which to the outsider appears sordid and ugly, he has presented it with a success and in a manner that is his alone; and now that he has awakened our keen interest in the Ghetto and its inhabitants, it is to be hoped that we may have many other volumes with a similar source of inspiration. Mr. McClure deserves a word of praise for the way in which "Ghetto Tragedies" is produced: of pocket libraries its shape is as convenient as any, and in paper, cover, and type it leaves nothing to be desired.

HISTORY.

ALLCROFT, A. H., M.A., and W. F. MASOM, M.A. *The Tutorial History of Rome to 14 A.D.* (W. B. Clive and Co.) Crown 8vo. Cloth. Pp. 416. 3s. 6d. University Correspondence College Tutorial Series.

This volume, which shows the usual drawbacks and the usual advantages of very compressed manuals, traces the history of Rome down to the reign of Augustus. Its plan of arrangement is to divide clearly foreign from domestic history, while at the same time indicates how the one series of events affected the other. Very ingenious little maps in black and white clear up the geographical aspect of the history; but the absence of an index detracts very largely from the value of the volume.

JOYCE, P. W., M.A., etc. *A Concise History of Ireland from the Earliest Times to 1837*. (M. H. Gill and Son, Dublin.) Crown 8vo. Cloth. Pp. 312. 3s.

Dr. Joyce has condensed the greater portion of this book from his "Short History of Ireland from the Earliest Times to 1608," which was published a month or two ago; but the chapters dealing with the years between 1608 and 1837 is of course new. Although greatly condensed "it is not," he says, "a cram book, but a connected, intelligible narrative, into which I have tried to infuse some life and spirit." The volume is divided into four parts, dealing respectively with the manners, customs, and institutions of the ancient Irish; Ireland under native rulers; the period of the invasion; and the period of insurrection, confiscation, and plantation.

BESANT, WALTER. *The History of London*. (Longmans.) Crown 8vo. Cloth. Pp. 256. 2s. 6d.

In a letter to the *Athenæum* Mr. Walter Besant denies that this book is merely an abridgement of his larger work on the same subject, published last year by Messrs. Chatto and Windus. "The History of London" is, he says, "a history of the city and its institutions, written in the hope that the study of this history, which may be taken to represent in essence the history of all other English towns, will be found helpful in the education of our children, to whom we have at last begun to teach something of their duties and responsibilities as citizens, the privileges of their position, and the meaning of their inheritance." The book is very fully illustrated.

TREGARTHEN, GREVILLE. *Australian Commonwealth*. (T. Fisher Unwin.) Crown 8vo. Cloth. Pp. 444. 5s. Story of the Nations Series.

The author, writing from Sydney, has attempted in this volume to adhere as far as possible to the story of the seven colonies—New South Wales, Tasmania, Victoria, Western Australia, South Australia, Queensland, and New Zealand—without entering into questions that are still the subject of contention; and he quotes with approval Governor Philip's description of Australia as "the most valuable acquisition Great Britain ever made." As is usual with the Story of the Nations Series the volume is well illustrated and contains a number of maps.

MISCELLANEOUS.

ADDISON, KATE. *Economical Cookery for the Middle Classes*. (Hodder and Stoughton.) Crown 8vo. Cloth. Pp. 252. 3s. 6d.

A fourth edition, containing over three hundred more recipes than did the first, published fourteen years ago.

CORBET, R. ST. J. *From the Bull's Point of View: the True Story of a Bull-Fight*. (Leadenhall Press.) Paper Cover. 6d.

Mr. Corbett professes to write the true story of a Spanish bull-fight as seen in 1893, taking the only possible view of the subject and expressing the pious hope that "the tormentor of bulls and horses may be ashamed, civilized, and legislated off the earth's surface ere we reach the year 1900." He marvels that a "sport" so fiendishly brutal and so unutterably cruel, a pastime so degrading and so foul, can be permitted as a national institution at the close of the nineteenth century.

PITT, RUTH J. *The Tragedy of the North Gods*. (T. Fisher Unwin.) 8vo. Cloth. Pp. 256. 6s.

Miss Pitt has attempted to show in this volume what the religion of the old Norseman was, on what lines he formed his life, and what were the ties which braced him for warfare and death. Four illustrations are by Mr. J. P. Jacobson-Hood and Mr. J. A. J. Brindley.

WAGNER, LEOPOLD. *More About Names*. (T. Fisher Unwin.) 8vo. Buckram. Pp. 287. 7s. 6d.

Mr. Wagner, who is already well known to the curious in such matters from his "Names: and their Meaning," gives us in this volume what is practically a continuation of his first. It is full of interesting matter not easily to be found elsewhere, and an astonishing amount of reading and research must have gone towards its compilation. The titles of some of the chapters are: "Things Theatrical," "Titles of Honour," "Firearms and Projectiles," "Matrimony," "Schools of Philosophy," "Articles of Attire," "Prioung Types," "Cordials and Beverages," "Poets and Poetry." Without an index such a book would be almost valueless, so it is well that "More about Names" contains one that is universally complete.

POETRY, MUSIC AND THE DRAMA.

CHAMBERS, E. K. (Editor.) *Shakespeare's "Macbeth"* (Blackie.) Fcap. 8vo. Cloth. Pp. 188. 1s.

The third volume of the Warwick Edition of Shakespeare, to which, "an attempt is made to present the greater plays of the dramatist in their literary aspect, and not merely as the material for the study of philology or grammar."

DOUGLAS, SIR GEORGE, Bart. *Contemporary Scottish Verse*. (Walter Scott.) 16mo. Cloth. Pp. 348. 2s.

A very admirable indication of all that is best in the poetical work of Scotchmen of to-day. With the exceptions of Mr. R. L. Stevenson, Mr. Andrew Lang, and Dr. George MacDonald, Sir George Douglas has been guided in his selections from the work of all writers now living by the poets themselves; and, on the whole, the selection seems judicious, and fairly representative. The list of poets is not a long one: William Bell Scott, James Thomson ("B. V."), Professor Blackie, Dr. George MacDonald, Dr. Walter C. Smith—who should surely have included "Waiting" and "Mirren" among the verses by which he is represented—Earl of Southesk, Professor Veitch, Professor Nichol, Robert Buchanan, Andrew Lang, Alexander Anderson, J. Logie Robertson ("Hugh Halliburton"), Robert Louis Stevenson, William Sharp, John Davidson, and the editor himself, who adds a brief introductory and critical note. A brief collection of notes by the authors, a dated list of their chief poetical publications, and a glossary—although there is very little dialect verse in the collection—greatly add to the value of the anthology, which has for frontispiece, we should add, an admirable photograph of the portrait of Mr. Stevenson which appeared in the Review a few months ago.

Poems of Charlotte, Emily, and Anne Brontë, with Catalogue of Poems by Patrick Brontë. (J. M. Dent and Co.) Fcap. 8vo. Cloth. Pp. 246. 2s. 6d. net.

Issue in uniform with the edition of the Brontë novels which Messrs. Dent are now publishing. The volume contains three illustrations: the Birthplace of Charlotte Brontë, the Brontë Waterfall, and Haworth Church and Parsonage.

WRIGHT, J. C. (Editor.) *Wordsworth for the Young*. (Jarrold.) Crown 8vo. Cloth. Pp. 100.

A selection of those of Wordsworth's poems which are most suitable for young readers, with brief notes by the editor.

REFERENCE BOOKS.

FOVARGUE, H. W., and J. J. OGLE. *Public Library Legislation*. (Simpkin.) Paper Covers. Pp. 172. 2s. 6d.

A timely guide to the law relating to public libraries and technical education, and all other statutes affecting libraries, museums, art galleries, etc., in the United Kingdom. The Acts of 1892 and 1893 being included, the volume is an indispensable handbook to all interested in the Public Library and Technical Education movements. The complete list of towns where the Public Libraries Acts have been adopted, corrected to June 30, 1893, is given in the Library Association Year Book referred to below.

Library Association Year-Book for 1893. (Simpkin.) Paper Covers. Pp. 91. 1s.

This book gives, besides syllabuses of the examinations held by the Library Association and specimens of examination questions, the British Museum Cataloguing Rules, the Bielefeld Library Cataloguing Rules, and the Cataloguing Rules adopted by the Library Association. The rules of the British Museum are appalling; those of the Bielefeld are more reasonable; and those of the Library Association are quite simple and sensible.

SCIENCE AND NATURAL HISTORY.

"A SON OF THE MARSHES," Forest Tithes and Other Studies from Nature. (Smith, Elder and Co.) Crown 8vo. Cloth. Pp. 208. 5s.

A series of papers, reprinted from the magazines, by the only man upon whom the mantle of Richard Jefferies has fallen.

BURNETT, J. COMPTON, M.D. Diseases of the Skin: Their Constitutional Nature and Cure. (Homeopathic Publishing Co.) Fcap. 8vo. Cloth. Pp. 240. 3s. 6d. Second edition, revised and enlarged.

BUTLER, EDWARD A., B.A., B.Sc. Our Household Insects: An Account of the Insect Pests found in Dwelling-houses. (Longmans.) Crown 8vo. Cloth. Pp. 344. 6s.

The contents of this book originally appeared as a series of articles in *Knowledge*, whence they have been reprinted with a large number of very admirable illustrations, photographs and otherwise. Mr. Butler has written primarily for those who have no special knowledge of the subject, endeavouring to put the descriptions of insect structure into ordinary language as far as possible; and his aim has been to show that every one has ready to hand, with very little trouble in the way of collection, abundant material for the practical study of that most fascinating branch of natural history, entomology.

DAWSON, SIR J. WILLIAM, F.R.S., etc. Some Salient Points in the Science of Earth. (Hodder and Stoughton.) Crown 8vo. Cloth. 7s. 6d.

"The present work contains," says Sir William Dawson in his preface, "much that is new, and much in correction and amplification of that which is old; and is intended as a closing deliverance on some of the more important questions of geology, on the part of a veteran worker, conversant in his younger days with those giants of a younger generation, who, in the heroic age of geological science, piled up the mountains on which it is now the privilege of their successors to stand." In his final paper upon "Man and Nature," the author says that "mere materialistic evolution must ever and necessarily fail to account for the higher nature of man," and that the present want of union in the relations between man and nature "requires for its rectification nothing less than the breathing of that Divine Spirit which first evokes order and life out of primeval chaos." Other chapters deal with such subjects as "World-making," "The Imperfection of the Geological Record," "The History of the North Atlantic," "The Apperition and Succession of Animal Forms," "The Genesis and Migration of Plants," "The Growth of Coal," "The Great Ice Age," and "Early Man."

HOUSSEY, FRÉDÉRIC. The Industries of Animals. (Walter Scott.) Crown 8vo. Cloth. Pp. 258. 3s. 6d. Contemporary Science Series.

This English translation has been revised throughout and enlarged, with the author's co-operation. It deals, *inter alia*, with the hunting, fishing, wars and expeditions of animals, their methods of defence, their provisions and domestic animals, the rearing of their young, and their dwellings and their defence and sanitation. The book contains forty-four illustrations.

HUXLEY, THOMAS H. Method and Results: Essays. (Macmillan.) Globe 8vo. Cloth. Pp. 430. 5s.

The first volume of a collected edition of Professor Huxley's works to be published at monthly intervals in the Eversley Series. The book opens with a short autobiographical paper, which is followed by a series of essays, the oldest of which first appeared in 1866. In one of the essays, that upon Descartes' "Discourse touching the Method of Using One's Reason rightly and of Seeking Scientific Truth," is given an account of the indispensable conditions of scientific assent, as defined by Descartes; the remaining eight, in Professor Huxley's own words, "set forth the results which are attained by the application of the 'Method' to the investigation of problems of widely various kinds; in the right solution of which we are all deeply interested." What these problems are can be gathered from the titles of the different essays: "On the Advisability of Improving Natural Knowledge," "The Progress of Science," "On the Physical Basis of Life," "On the Hypothesis that Animals are Automata," "Administrative Nihilism," "On the Natural Inequality of Man," "Natural Rights and Political Rights," and "Government: Anarchy or Regimentation."

MACH, DR. ERNST. The Science of Mechanics: a Critical and Historical Exposition of its Principles. (Watts and Co.) Crown 8vo. Half Leather. Pp. 534.

This volume is not, says the author, a treatise upon the exposition of the principles of mechanics, its aim being rather to clear up ideas, expose the real significance of the matter, and get rid of metaphysical obscurities. The little mathematical it contains is merely secondary to its purpose. The book is illustrated with numerous diagrams, portraits, etc.

Philips' Anatomical Model: a Pictorial Representation of the Human Frame and its Organs. (Philip.) Royal 8vo. Paper cover. 2s.

Dr. Schmiel's descriptive text for this work has been adapted into English by Mr. William S. Farnaux. The arrangement of the model of the human body is very ingenious, and the book is likely to interest many readers in human physiology and anatomy.

WALKER, JANE H., M.D., etc. A Handbook for Mothers. (Longmans.) Crown 8vo. Cloth. Pp. 200. 2s. 6d.

Contains simple hints to women on the management of their health during pregnancy and confinement, together with plain directions as to the care of infants.

THEOLOGICAL.

EXELL, REV. JOSEPH S., M.A. The Biblical Illustrator: Hebrews. Volume II. (Nisbet.) 8vo. Cloth. Pp. 685. 7s. 6d.

EXELL, REV. JOSEPH S., M.A. The Biblical Illustrator: The Acts. Volume I. (Nisbet.) 8vo. Cloth. Pp. 722. 7s. 6d.

MACGREGOR, REV. JAMES, D.D. The Revelation and the Record: Essays on Matters of Previous Question in the Proof of Christianity. (T. and T. Clark, Edinburgh.) 8vo. Cloth. Pp. 265. 7s. 6d.

TRAVEL, GEOGRAPHY AND TOPOGRAPHY.

BICKFORD-SMITH, R. A. H., M.A. Greece under King George. (Bentley.) 8vo. Cloth. Pp. 350. 12s. With Map.

A very comprehensive work whose scope can best be judged from the titles of the chapters: "Population," "Agriculture," "Forests," "Industries," "Commerce," "Business," "Internal Communication," "Finance," "Public Order," "Education," "Culture," "Archæology," "Religion," "Army and Navy," "Politics," "Society," "Philanthropy," and "Pan-Hellenism." It is pleasant to notice that Mr. Bickford Smith takes a very cheerful view of the Greek character, and of the country as it stands to-day.

EYRE-TODD, GEORGE. Byways of the Scottish Border: a Pedestrian Pilgrimage. (James Lewis, Selkirk.) 4to. Cloth. Pp. 226. 4s. 6d. net.

The record of a ten days' walking tour through some of the most famous districts of the Border country, from Moffat eastwards. The volume is illustrated with process reproductions of twelve water-colour drawings of Mr. Eyre-Todd's companion, Mr. Tom Scott, A.R.S.A., and is certainly produced in a way that reflects the greatest credit both on provincial printing-press and provincial publisher.

GORDON, A. E., "Clear Round"; or, Scenic Story from Other Countries. (Sampson Low.) Crown 8vo. Cloth. 7s. 6d.

This is a record of a scamp round the world in three and a half months from Liverpool across Canada to Japan, to which the most interesting part of the book is devoted, and then home over India.

MORLEY, GEORGE. Rambles in Shakespeare's Land. (The Record Press.) Fcap 8vo. Cloth. Pp. 58.

A charming and useful little volume containing a series of descriptions "of the scenes in the shire for ever made famous by the birth and genius of Shakespeare." The author's aim has been to gather some account, somewhat more lengthy than is usually to be found in guide-books, of the chief places of historical and antiquarian interest in Warwickshire. He has certainly succeeded.

PAYNE, EDWARD JOHN, M.A. (Editor). Voyages of the Elizabethan Seamen to America: Select Narratives from the "Principal Navigations" of Hakluyt. First Series. (Clarendon Press, Oxford.) Crown 8vo. Cloth. Pp. 272. 5s. New edition.

Besides the lengthy, but very interesting, introduction, and a brief note on Hakluyt's life and works, this first series contains "Directions for Taking a Prize," the narratives of the three voyages taken by Hawkins, the three by Frobenius, the famous voyage of Drake, and the description of "The Great Armada."

CONTENTS OF REVIEWS AND MAGAZINES.

ENGLISH AND AMERICAN.

Altruistic Review.—21, Quincy Street, Chicago. Sept. 15. 20 cents.
The Case at Brook Farm. Rev. A. B. Chaffee.

Amateur Work.—Ward, Lock, Salisbury Square. October. 6d.
Cutting and Polishing Pebbles. Illustrated.

American Journal of Politics.—114, Nassau Street, New York.
September. 35 cents.

The Limits of a State Education. General M. M. Trumbull.
Should We Restrict Immigration? Arthur Cassot.

APPOINTED BY
SPECIAL
ROYAL WARRANT

SOAP MAKERS
TO HER MAJESTY
THE QUEEN.

EVERY HOUSEWIFE

has her own idea as to which are the easiest and best methods to adopt in her household duties ; but some seem to always possess the happy knack of making home a real home, full of brightness and happiness, with everything clean and cosy and comfortable. Such a housewife

KNOWS

by experience that to obtain the best results in the shortest time, and to give the household linen that special whiteness and freshness she so much desires, she must use only the best soap. Whilst there may be differences of opinion as to which is the best soap, it is certain that that soap must be worthy of a fair trial the makers of which have been appointed by Special Royal Warrant Soap Makers to Her Majesty the Queen ; who have obtained the Gold Medal at the Paris Exhibition, 1889 ; and, in addition, seventeen other medals and awards. This Soap is

SUNLIGHT SOAP.

MR. GEO. THOS. CONGREVE'S TREATMENT.

CASE OF "HOPELESS PHTHISIS"

BROUGHT HOME TO DIE!

BUT CURED! BY THE TREATMENT OF
Mr. GEO. THOS. CONGREVE.

"DEAR SIR,—I have much pleasure in writing you to say that one of my sons, whose life was despaired of in consequence of Consumption having supervened an attack of inflammation of the lungs, has been completely restored to health by your invaluable treatment. I cannot speak too highly of your medicine, for a more complete and wonderful cure, I think, has never been effected by any other medicine. My son returned home in a hopelessly dying state. By accident I heard of your remedy, and determined to try it. My wife and other members of my family were surprised and delighted to notice some change for the better, after a few days only; and in a few months, I am glad to say, my son was entirely restored to health, and is now one of the strongest and most robust of our family.

"As the publication of this case would, I think, do much good, you can make any use you like of this letter, &c. I shall write an account to my relatives living in Tasmania and Queensland, and should suggest your inserting this in the papers there.—I am, dear Sir, yours gratefully, JOHN B. HARDWICKE, Selby Villas, Prettwell Street, Southend, Essex."

In confirmation of the above, Mr. Hardwicke has sent me the certificate of his son's discharge from the Royal Navy: "Sydney Hardwicke *invalided; case, Pneumonic Phthisis.*" Also a certificate as to his present state of health from a surgeon at Southend:—"I hereby certify that Sydney Hardwicke is sound in body and of good constitution."—9th August, 1892.

THE MOST SUCCESSFUL TREATMENT IN THE WORLD FOR CONSUMPTION, AND ALL CHEST DISEASES, AND RESULTS OF INFLUENZA.

Read Mr. CONGREVE'S Book "ON CONSUMPTION, ETC.," which may be had, post free for ONE SHILLING, from the Author, Coombe Lodge, Peckham, London, S.E.

THE DAILY PAPER.

THE announcement made last month concerning the proposed *Daily Paper* has naturally excited considerable comment. Whatever may be the ultimate result of my offer, one thing already stands out quite clearly. That is, the soundness and the utility of the scheme which I set forth as that by which a newspaper can be financed.

The idea, for which I can claim no credit, came to me nearly four years ago as I was walking across Charing Cross Bridge on my way to the *Pall Mall Gazette* office. Like all journalists, I suppose, I was chafing a little at the difficulty which the lack of capital imposes upon the editor, when the question was put to me within: "Why don't you raise your capital by giving it away?" I laughed at the paradoxical suggestion, but it was repeated and pressed upon me until I began to see that there was something in it. Before I had got to the other end of the bridge, I saw that there was everything in it, and from that day to this I have only waited for a suitable opportunity of putting the suggestion to a test. Even if there were no adequate response to my offer, that would not prove that the scheme was unsound. It would only prove that I was not wanted to edit a daily paper. A journalist who was wanted, might take up the scheme, and find in it the short and easy solution of his difficulties.

I have no patent rights in the idea. As it was given to me so I give it to the public. If any should ask who gave it me, and by whom was the question asked that started the suggestion, I can give no answer. Sometimes on a calm summer day there floats down slowly through the air a white downy feather. It does not come down as a stone falls. Its motion is slow and graceful, and sometimes it seems to pause as it descends. But at last it reaches the ground. Where does it come from? From some bird obviously. But as far as you can see up into the infinite azure of the sky, you see no plume from which this fluffy fragment of down could have come. Yet it is there, and a bird grew it somewhere and sometime. Of that you can be sure, but only of that. So it is with this idea; it came to me from without as much as that feather does. All ideas must originate in some mind somewhere, and as this one did not originate in my consciousness, I have accepted it gratefully as a free gift of grace from the Not Myself.

In carrying this idea into effect I should prefer, undoubtedly, to receive my 100,000 subscriptions from 100,000 individuals. That was why I made the offer last month to the readers of *THE REVIEW OF REVIEWS*. But as a matter of business such an arrangement was almost inconceivable. The business value of the suggestion made to me, upon which I have acted, only comes in when you can deal with the shares in blocks of fifty or a hundred. A one pound share even at ten per cent. is somewhat of a nuisance, unless you can put several of them together. The question has repeatedly been put to me whether any one can apply for more than one share. I reply, "Certainly, but if you do, you must subscribe for as many papers as you want debentures." To which the answer is, "But I don't want more than one copy of the paper." Thus here arises at the very outset the necessity for the *bête noire* of modern Socialism, the middleman. And a very interesting problem arises as to whether the associative principle has gained sufficient hold amongst us for this offer to be utilised for the purposes of financing all manner of good causes, or whether it will fall into the hands of the trade.

Everything of course depends upon whether the *Daily Paper*—a sample copy of which is issued with our Christmas Number—is likely to catch on. I have my own ideas on that subject, and if those ideas are correct, and are shared by others, it is merely a question whether my £100,000 are snapped up by the trade, or are made the means of financing various forms of philanthropic enterprise. Any active local secretary of any association, social or religious, who believes that the paper would go to the extent of a hundred copies in his district, could put £100 into the treasury of his society, by standing out of £130 for twelve months. He would get the money back in the

daily pennies which any newsagent would collect for him on the usual terms, and at the end of the year he would have £100 in five or ten per cent. debentures. Any society with a hundred branches throughout the country, each of which could secure a hundred subscribers, might obtain a permanent endowment of £10,000 yielding from £500 to £1,000 per year.

No such offer has ever been made in our time. For instance, an association for the general advocacy of the Woman's Movement—which I mention because I should probably be in more general accord with it than with any other political or social society—might be financed into a position of opulence which no other society occupies, if its founders were to take up, say, 50,000 subscriptions for one year. At the end of the year they would have had £65,000 worth of papers to dispose of, by which they could have recouped themselves for every penny of their outlay; and they would then find themselves in possession of £50,000 debentures bearing from five to ten per cent. interest, which would supply offices, secretaries, and agents on a scale possible to no other Woman's Society in existence.

The immense premium offered for the purposes of launching the *Daily Paper* will in the natural order of things fall into the hands of the trade unless means are promptly taken to intercept it by societies or associations, existing or to come into existence. The trade will naturally look at the question solely from this point of view: Will the *Daily Paper* catch on? If it is certain to catch on, then there is £100,000 to be scrambled for, that at least is quite clear. For if the paper, of which they have now a sample before them, will sell on its own merits as *THE REVIEW OF REVIEWS* sells, or as *Tit Bits* and *Answers* sell, then the newsagents can put £100,000 into their pockets without the least risk, and at the same time increase their own business. Take for instance the largest newsagents in the world—Messrs. W. H. Smith and Son. Suppose for a moment that they knew as a positive certainty that next year 100,000 copies per day would be sold of the *Daily Paper*. In that case they would be no less certain to have the handling of 30,000 of them. If they put it only at 25,000, which is far below their minimum proportion of the sales of a daily paper of 100,000 circulation, they could (of course, I know they will not, and I am taking their case because there will be no suspicion of any attempt to appeal to the firm that is named), by subscribing in advance for 25,000 copies of the paper, in return for the laying out of £30,000 for twelve months, put £25,000 in their pocket. They would, in addition, have the profit upon the supplying of 25,000 copies through the trade in the ordinary course.

I know Messrs. W. H. Smith and Son would never dream of making a deal on such terms. They will sell the paper in the ordinary way, as they would sell any other paper, but beyond that they will not go. But the possibilities are the same for any newsagent, only on a smaller scale; i.e., a newsagent, wholesale or retail, who was confident that he could dispose of 2,000 or 5,000 copies in the ordinary way through the trade, only needs to raise £3,000 or £6,500 to make over 75 per cent. interest in the first year; whichever way it turns, the newsagent must gain. The subscription price of the paper has been placed at the full rate of a penny a day, without allowing any discount for payment in advance, in order to avoid any appearance of underselling the trade through whom it is probable the paper will be chiefly distributed.

The terms upon which its distribution will be undertaken will naturally be subject to an arrangement between the *Daily Paper* and the newsagents. At present, the custom of the trade is well-established. The newsagent undertakes to get orders, to take the risk of bad debts, and to pay the cost of carriage. In return for this service, he receives his present commission, and that, of course, is the basis upon which the negotiations between the trade and the *Daily Paper* would rest. Upon that point there need be no misunderstanding. Whatever the terms ultimately arrived at may be, they will start upon the basis of existing rates, as adjusted to existing circumstances. In matters of business no one expects any one to work for nothing, nor do I wish to complicate a revolution in newspaper finance by undertaking at the same time a revolution in news distribution. The offer which I make, if taken up by the trade, would practically make them assured partners to the extent of five or ten per cent. in an enterprise all the risks of which will be borne by myself.

But I close as I began. From the point of view of sympathisers, everything depends upon the degree of personal confidence which they have in me. From the business point of view, that element does not come in. The dominating factor in the question, looked at as a financial speculation, depends upon the opinion which each possible subscriber in the trade, or out of it, forms as to the probabilities of such a *Daily Paper* as that which is published with my Christmas Number, commanding a circulation and becoming a property. If they do not think it will catch on, they will wisely have nothing to do with it. On the other hand, if they believe, as many who have spoken to me do believe, that the *Daily Paper* is built on lines that are certain to render it a great success, then there is £100,000 to be scrambled for, and my part in the matter is now limited to seeing that the applicants share fair all round. The question is now entirely beyond my control, or beyond any possibility of my exercising any influence upon the matter. In proof whereof, as the lawyers say, I write these lines on the eve of sailing for New York. I shall not return to this country until after the December REVIEW has gone to press. Before that time, the die will have been cast one way or the other. Which way the lot will fall I know not, nor any mortal. All that I know is, that whatever the decision may be, I will accept it loyally, cheerfully, and with a conviction that I shall then have got my marching orders.

THE DAILY PAPER COMPANY, LIMITED.

I THINK it is only due to my readers to explain how the Daily Paper Company came into existence, and to give them a brief narrative of the facts which will enable them to understand exactly how things are. My original idea was to have issued my debentures in my own name, but Sir George Lewis advised me that it would be absolutely necessary to create a limited liability company in order to issue those debentures. I objected, preferring the unlimited freedom of a private individual acting on his own responsibility, without any control from shareholders or others. Sir George Lewis assured me that I could be as free as a limited company as a private individual if I were careful to have the articles of association rightly drawn, and if the shareholders were my own personal friends, who would join the company simply and solely for the purpose of giving me a free hand. There was no difficulty about these stipulations. Sir George Lewis received *carte blanche* to draw the articles as he pleased, the only indispensable point being that I was to be as free to do what seemed right in my own eyes and whatever seemed necessary for the welfare of the paper, as if I was working on my own responsibility. The first counsel consulted raised many objections, and declared that it would be very difficult, if not impossible, to draft articles of necessary breadth. It was therefore necessary to employ other counsel, and Mr. Palmer, who is the first authority on company law, received his instructions on Thursday, October 12, at eleven o'clock. After some discussion he entered heartily into the scheme, and by seven o'clock that night the draft of the articles of association was submitted to me and approved. They went to the printer at once, and by five minutes to two on the following day the company was registered at Somerset House. The articles of association, together with the memorandum, occupy about thirty-eight foolscap printed pages. The putting of them together at such high pressure and in such a brief space of time was one of the quickest things done under the Companies Act.

It is necessary to give this explanation in order that the true inwardness of the articles of association may be understood. The capital was purposely fixed at a nominal figure, inasmuch as the real working capital of the company, by the scheme explained in the November Review, will be supplied by the subscribers themselves. The £20 capital was merely fixed in order to comply with the provisions of the Companies Act. This sum is divided into six founders' shares of one £1 each and fourteen ordinary shares of a similar amount, limited to a maximum dividend of ten per cent. In order to render it impossible for the machinery of the Companies Act to be used in any way to limit my responsibility or to interfere with the free exercise of my discretion, a series of provisions have been drafted, which, by universal consent, secure the end in view. To begin with, I hold all the founders' shares and eight of the ordinary shares. Whenever the shareholders are called together I have a clear majority of the ordinary shares, but in case this should not be sufficient, it is expressly stipulated in the articles of association that my shares shall always confer upon me the right to ten more votes than the aggregate votes conferred upon all the other shares. The result of this provision is that, at any meeting of the company, whether general or ordinary, I can always override all opposition, and the company becomes but another term for myself. This of course is what was aimed at from the first, both by the

friends who associated with me, and by the learned counsel who drew up the articles of association. As it was said in the course of the discussion with counsel, W. T. Stead was to be considered as an estate to be developed, his ideas were as so many mineral deposits which have to be worked, and as nobody knows what those ideas are except W. T. Stead himself, it was necessary for the success of the venture that the whole of the responsibility should be upon his head, and that no one in the company should have any right to interfere in any way with the free exercise of his absolute discretion. This, of course, at first sight provokes criticism, but objections will disappear when it is understood that all that is to be done is to define simply and legally under the Companies Act that I should have the same liberty of action that is possessed by every subject of Her Majesty who has not been converted into a limited liability company.

The articles of association provide for the management of the affairs of the company under the usual forms of the Companies Act, as, for instance, there must be general meetings of the shareholders which I am to call. Three constitute a quorum. I take the chair by right of office, and as my vote is to count ten more than the votes of all those who are present, and I have besides the casting vote as chairman, it would seem that I can have things pretty much my own way. The general director so constituted can from time to time increase the capital by the increase of such shares to such an amount as may be deemed expedient. In addition to the powers which I possess by being constituted a permanent working majority of the general meeting, a new office has been created for me, under which I become permanent general director of the company. Here I quote from the Articles of Association:—

The Permanent Governing Director.

73. The said William Thomas Stead shall be the permanent governing director of the company, and subject as hereinafter provided he shall hold that office for life, and whilst he holds the same the government and control of the company shall be vested in him.

74. The said William Thomas Stead, whilst he holds the office of governing director, may, from time to time, and at any time, appoint any other persons to be directors of the company, and may define, limit, and restrict their powers, and may fix and determine their remuneration and duties, and may at any time remove any director however appointed, and may at any time convene a general meeting of the company. Every such appointment or removal must be in writing under the hand of the said William Thomas Stead.

75. The governing director, in addition to the powers and authorities by these presents expressly conferred upon him, may exercise all such powers and do all such acts and things as may be exercised or done by the company.

79. Without prejudice to the general powers conferred by the last preceding clause, and of the other powers conferred by these presents, it is hereby expressly declared that the governing director shall have the following powers, that is to say:—

(Then follow seven clauses, after which comes the eighth and last.)

(8.) To conduct his proceedings in such manner as he shall in his absolute discretion think most convenient.

It is further enacted that "the declaration of the governing director as to the amount of the net profits of the company shall be conclusive."

3. The shares other than those subscribed for by the memorandum of association shall be under the control of the governing director, who may allot or otherwise dispose of the same to

such persons on such terms and conditions and at such time as he thinks fit.

24. The governing director may refuse to register any transfer of shares upon which the company has a lien to a transferee of whom he does not approve, without being bound to state any reason for such refusal.

40. The governing director may from time to time at his discretion raise or borrow or secure the payment of any sum or sums of money for the purposes of the company, but so that the amount at any one time owing in respect of the sums so raised, borrowed, or secured, shall not without the sanction of a general meeting exceed the nominal amount of the capital. Nevertheless no lender or other person dealing with the company shall be concerned to see or inquire whether this limit is observed.

41. The governing director may raise or secure the repayment of such moneys in such manner and upon such terms and conditions in all respects as he thinks fit.

96. The governing director shall from time to time determine whether, and to what extent, and at what times and places, and under what conditions or regulations, the accounts and books of the company, or any of them, shall be open to the inspection of the members, and no member shall have any right of inspecting any account or book or document of the company, excepted as conferred by statute or authorised by the governing director, or by a resolution of the company in general meeting.

THE OBJECTS OF THE COMPANY.

I have often endeavoured to sketch, in more or less shadowy outline, the various functions which seem to me to be capable of being filled by an editor of a daily paper. There is, however, some degree of novelty in the attempt to embody these aspirations in the cut-and-dried formula of a legal document. In the Memorandum of Association of the Daily Paper Company we have such an attempt, for which my legal advisers are solely responsible. I did not alter a word in the draft. Had I done so I should have taken some articles out and certainly should have added others; as it is, however, the omnibus clause is sufficiently wide to enable me to do anything which seems necessary or expedient:—

4. To redress or alleviate wrongs and hardships of all kinds, whether public or private.

5. To expose, denounce, remove, or put down abuses and objectionable habits or customs, and to caution and warn the public, or any sections thereof, against dangers, perils, and risks, and to prevent and avert the same.

6. To protect and support the defenceless and helpless against oppression and cruelty.

7. To establish, promote, and assist any institutions, business concerns, undertakings, and conveniences which may seem calculated, directly or indirectly, to benefit the public or any section thereof.

8. To encourage the discovery of and investigate and make known the nature and merits of inventions, and to acquire any patents or licences relating to any such inventions.

9. To promote and undertake discoveries and investigations of all kinds, and with a view thereto to employ experts, expeditions, commissioners, and agents.

10. To promote friendly relations between employers and persons employed by them.

11. To encourage thrift and temperance.

12. To promote the cause of education in the widest sense.

13. To carry on any business or undertaking, whether manufacturing, commercial, or otherwise, except life assurance, which the company may think fit to carry on.

14. To redeem, compound, reduce, remove, or procure the alteration of any imposts, taxes, tolls, fees, charges, rules, or regulations which are inconvenient, onerous, or objectionable to the public or any section thereof.

15. To promote and facilitate emigration.

16. To act as arbitrator, umpire, or trustee in all such cases as may seem expedient, and to carry on all kinds of agency business.

17. To procure the decisions of questions of law which it may seem expedient to have decided, and to originate and promote improvements in the law, and to support or oppose alterations therein, and to effect improvements in administration.

18. To admit any persons to be associates of the company on such terms, and to confer on them such rights and privileges, as may seem expedient.

19. To grant donations and subscribe money in such cases as may seem expedient, and whether for public, private, charitable, or benevolent purposes, or otherwise.

20. To carry on business as bankers, financiers, promoters, and concessionnaires in all their respective branches, and to carry on all kinds of guarantee and indemnity business.

21. Generally to undertake and carry out any operations or transactions whatsoever, except life assurance, which may be lawfully undertaken and carried out by a private individual capitalist, and which the company may think it expedient to undertake and carry out.

The express exclusion of life assurance will render it necessary, should the paper come into existence, for me to make a separate arrangement in order that I might undertake that description of business should it seem desirable that I should do so. The reason why it is excepted in the articles of association is because the law rightly requires that any undertaking to found a system of life assurance must have a more adequate capital than the sum of £20. Thus has come about my transformation into the Daily Paper Company, Limited.

As for the *Daily Paper*, a specimen copy of which was issued with the Christmas Number of the *REVIEW*, "Two and Two Make Four," the following description will be read with interest:—

THE DAILY PAPER.

The *Daily Paper* is almost exactly the shape of *THE REVIEW OF REVIEWS*, and consists of a neatly folded, pasted, and trimmed pamphlet of forty pages, ten of which are devoted to advertisements. The other thirty are devoted to news of the day and special articles thereupon. It is Mr. Stead's theory that what the average reader wants is not so much acreage of print as a handy readable penny paper, every page of which will contain something of interest. It may be said to be a kind of a cross between the *Pall Mall Gazette* and *Tit Bits*, and it avowedly aims at throwing a bridge over the abyss which separates the millions who read weekly miscellanies from the comparatively few who read the daily papers. The title-page of the paper is plain and distinctive. It bears the legend: "For the Union of all who Love, in the Service of all who Suffer."

A reproduction of the title-page of the new paper, with the table of contents, is given on the next page.

Mr. Stead's idea at first was to produce a paper exactly as it would have appeared if the *Daily Paper* had been in regular course of publication, and for this purpose he selected the fourth of October, as it is the day of St. Francis of Assisi, who more than any other represented the philanthropic side of the Christian Church. But in working out this idea it was evident that to put before the public in November the Stock Exchange quotations of October 3rd, and the stale news of a month back, would have been to prejudice the project from its very outset; and true above everything to his conception that a paper must be interesting and readable, Mr. Stead has reduced to a minimum the news of the day, only giving that which is necessary to show the position it would occupy in the paper. The first place in the paper is devoted to a very exhaustive and carefully compiled diary of the events of the day. These are compiled under various heads—

Political, Commercial, Legal, Recreational, and Miscellaneous. The theatres are subdivided according to the nature of the piece which they are playing. Within the compass of a single page is condensed a kind of anticipatory programme for the events of the day. Facing the Diary is the leading article, of which there is one and only one. The first article in the sample paper is devoted to setting forth, in the familiar style in which Mr. Stead has always been accustomed to lay down the law in his editorial columns, the Home Rule Bill for 1894. A draft of this bill is

1894, consisting of a preamble and one clause, enacting that a national convention of the representatives of the Irish constituencies should be held in Dublin for the consideration of all the schemes of Home Rule which have been brought forward, and report upon the same with a view to legislation in 1895. If the design is to provoke a conflict with the House of Lords it should be sent up in that form, when the Peers would be certain to throw it out. But if Ministers wish to relegate the question to the Irish people they can do it by forming the Irish members into a special committee empowered to meet at Dublin and to hold their meetings during the recess. By this means the Home Rule flag could be kept flying at the mast-head, while the decks were cleared for the enactment of British legislation. The only other editorials in the paper consist of brief notes under the title "Note!" The rest of the paper is devoted to news and special articles.

Immediately after the leader, the leading place is devoted to a carefully written summary of the events of the previous day. This is illustrated with a couple of small maps. It is one of Mr. Stead's theories that the busy man prefers to have his news served up in this condensed fashion, and that it is possible to condense into two pages of the magazine a compendium of the history of the previous day.

One feature which forms a notable departure from tradition is the publication of "In Place of Morning Service." Here we have what is avowedly intended for a substitute for the morning service which is no longer attended in our churches, and the family prayers which are more and more falling into disuse. What Mr. Stead provides in place of morning service consists of "Watchwords of Heroes," a collect for the day, and a lesson selected in this case from Mr. Stead's favourite poet, Lowell. There is besides a condensed homily for the day, which is to be written by leaders of religious thought, without any distinction of sect and religion. Facing the page "In Place of Morning Service," we have a page devoted to the saint of the day, who, on October 4, was St. Francis of Assisi. This is illustrated, and forms the first of a new series of the "Calendar of the Saints," who are to be selected impartially from the calendars of all the churches. Nor will this calendar be confined to the churches.

If the attempt to supply a substitute for Morning Service in a daily paper is novel, it is much less startling than the next feature, which consists of what is called an "Automatic Telepathic Interview with Lady Brooke on the Future of the British Aristocracy." If this feature can be kept up, Mr. Stead may fairly claim to be on the eve of revolutionising journalism, for he asserts that while he was at Dover and Lady Brooke was at Dunrobin—that is to say, when the interviewer and the interviewee were separated by a distance of 800 miles—he was able to interview her on the British Aristocracy as Part of the Wasted Wealth of King Demos. Mr. Stead put the questions mentally, and Lady Brooke, although at the time quite unconscious of being subjected to the process of interviewing, wrote through his hand the answers to the questions. No claim more astonishing has ever been made by any miracle-worker or magician. Lady Brooke, however, vouches for the accuracy with which her interviewer's automatic hand interpreted her thoughts, and in correcting the proofs she makes an addition which is obviously nothing more nor less than an amplification of the observations already written down. Mr. Stead for more than a year past has constantly received communications from his friends in this fashion, but this is the first occasion on which he has applied this unique power to journalistic enterprise.

THE DAILY PAPER.

ONE PENNY.

published on another page. Mr. Stead expresses the conviction that to reintroduce the Home Rule Bill of 1893 into the House of Commons in 1894, would spell blue ruin for Home Rule and suicide for the Liberal Party. While admitting that the Irish could compel the Government to do this if they chose, he bases upon a quotation from *United Ireland* and an article by Sir Gavan Duffy a plea for a compromise which, he believes, would meet the needs of the situation. That compromise is, briefly, that a Home Rule Bill should be introduced in

The opening meeting of the Church Congress, which met on October 3, is commissioned in a page, and to keep the balance between Church and Dissent even, there is an interview with a rural Nonconformist, who makes an energetic appeal for the formation of a Nonconformist association to avert the threatened extinction of rural Nonconformity. The appeal, which is strongly supported by the editor, is calculated to provoke as much discussion as anything else in the paper.

The question of the relation between the press and the theatre, which has long exercised Mr. Stead's mind, has been decided at last by him in a somewhat startling fashion. He publishes a two-page interview with Miss Robins, the well-known American actress, who has become so famous as the creator of "Hedda Gabler" and other of Ibsen's leading rôles. He offers her the position of chief dramatic critic for the *Daily Paper*. Miss Robins at first demurs, but Mr. Stead undertakes to make a pilgrimage round all the theatres and report his first impressions, for although he is forty-five he has never attended a theatrical performance excepting that of Oberammergau. Miss Robins then consents to undertake the management of a committee of artists and critics who take a serious view of the drama, and who are to set about no less a task than the formation of a national theatre, subventioned not by the State, but by subscriptions raised through the *Daily Paper*.

After this sensation it is comparatively tame to turn to an interview with the head of Messrs. W. H. Smith and Son's Library, even although the interview takes the form of a discussion between the editor and Mr. Faux as to the way in which the objects of the *Daily Paper* can best be achieved.

In place of the City Notes and Comments, which are to be a leading feature of the *Daily Paper*, we have inter-

views with Sir George Lewis, Mr. Labouchere, of *Truth*, and Mr. Wilson, of the *Standard* and the *Investors' Review*, on a crusade which Mr. Stead proposes to head against swindling company promoters and fraudulent philanthropic financiers. The article is entitled "On the Making and Losing of Money," and the title is supplied by Mr. Balfour of the Liberator Building Society, who is pilloried across the page. If

SIR GEORGE LEWIS.

Mr. Stead conducts his paper on the lines which he has laid down, he is warned that it will cost him a lawsuit a month and £10,000 per annum in lawyers' bills. After proposing to wield the sword of the Lord and of Gideon against the swindlers of society, Mr. Stead publishes a long plea for the publication of an English Bible—a proposal which has the hearty support of Mr. Bryce. The idea is that the whole of English history and literature might be condensed into a kind of *Review of Reviews* edition in the same way that the Old Testament was compiled by the inspired writers. The scheme Mr. Bryce declares to be both ingenious and suggestive. It has excited much enthusiasm in various quarters, and can hardly fail to be widely discussed.

From the compilation of a Bible to the reform of cookery is a long stride; but Mr. Stead takes it gaily, and proclaims that one of the great aims of the *Daily Paper* will be the Frenchification of English cooking. Special attention is to be paid to the dinner-table, and

Mr. Stead ventures to hope that the time is near at hand when the discovery of a new sauce will be telegraphed with as much detail as a murder or a horserace.

Another novel feature of the *Daily Paper* is the announcement which the editor makes, that whenever there is no news of special importance within the last twenty-four hours, the most thrilling and important event of "Yesterdays Long Ago" will be reported. By way of giving a sample of what he means he publishes a war correspondent's account of the battle of Salamis, in which Themistocles, more than 2000 years ago, destroyed the Persian fleet and saved the civilisation of Greece. The account is displayed with a profusion of cross-heading as if it were a telegram from the seat of war. It is much the most eloquent and brilliant piece of writing in the paper.

The position of honour in the centre of the paper is devoted to an attempt to carry out the idea which Mr. Stead has long maintained to be the coming event in journalism, namely the incorporation of the leading events of the world's history in "The Romance of the World," which, once begun, will never end, and be continued as a serial from day to day as long as the paper lasts. It was of course impossible to do more than show in a very fragmentary fashion the way in which this could be done. The story, however, in less than three pages, sets forth simply the leading features which resulted in the Matabele war. This conception of "The Romance of the World" may be said to be the leading plank in Mr. Stead's bridge. At present women, and a great number of men, will not read politics unless they can get politics in the shape of a story. In order to induce them to take an interest in affairs Mr. Stead proposes to serve up the news with the sauce which they like. The design has been submitted to many of the leading novelists of the day and has secured their enthusiastic approval.

It remains only for us to say a word on the advertisements of the paper. They are prefaced by an article on "Art in Advertising," which sets forth plainly that advertisements in the *Daily Paper* are to be treated like news, and rejected if not interesting. As this might be too hard upon the advertiser, a special staff of what may be called "advertisement journalists" will be maintained, whose business it will be to make advertisements interesting. No advertisement is to be disguised as news, and should any fraud be practised by advertisers in the columns of the *Daily Paper*, the editor undertakes to prosecute the advertiser. Most of the advertisements take the form of interviews, but there is one page in which Mr. Stead announces the various publications which he contemplates issuing when the *Daily Paper* comes into existence. They include two penny weeklies and two halfpenny weeklies, and also a series of "Daily Paper Classics," which will be published at threepence, identical in shape with the *Daily Paper*.

Such is the description of the specimen paper which Mr. Stead has laid before the public as the result of his reflections on journalism at home and abroad, and the practical experience of nearly a quarter of a century. Mr. Stead, who has never been in the United States, has now gone to the World's Fair, where he is picking up the latest notions in journalism that are to be found on the other side of the Atlantic.

It may be noted that there is no racing news in the *Daily Paper*. Those who wish to have the latest betting will have to go elsewhere.

A matter which so closely concerns the journalistic world as the establishment of a new daily paper on original lines, both financial and journalistic, has naturally

excited a great deal of discussion. I must express my sense of indebtedness to my journalistic friends for the exceptional kindness of their reception of the scheme. There is one exception which, however, is perhaps more eloquent than the comments of those papers which have discussed the *Daily Paper* in their columns. Not a single London morning daily, excepting the sporting and financial papers, has said a syllable upon the subject. The following are some of the comments which have appeared in the press, London and provincial, since the publication of our last number. As we go to press on the first of the month I am unable to publish any of the criticisms of the press upon the *Daily Paper* itself. The articles from which I make extracts deal exclusively either with the *Daily Paper* Company or with the financial scheme upon which the project was founded:—

OPINIONS OF THE PRESS.

DAILY PRESS OF LONDON.

The *St. James's Gazette* remarks that the *Daily Paper* "will be a Steadite paper, of course, belonging to no party, and doing that only which seems right in the eyes of Mr. Stead. It will support religion—all religions. Also, it will support the English-speaking race, with that fine healthy belief in the destiny and the greatness of the Anglo-Saxon for which we may pardon Mr. Stead many political errors. And it will support, of course, the woman's movement. In fact, if the paper is ever started, it will be a fine rousing publication, conducted with Mr. Stead's well-known energy, enthusiasm, and ingenuity. However, we hope Mr. Stead will get his money. His paper will probably say and do many things we shall not like, but it is certain to be good reading."

The *Westminster Gazette* describes the scheme as being "as original as it is audacious."

The *Star* is flattering. "The apostle of the spook," it says, "is not deficient in the world's cunning, for there is no bait so deadly amongst the gudgeons as the promise of 'something for nothing.' . . . If the scheme fails—well, an editor who has had the uncontrolled handling of £130,000 can hardly be said to have lived in vain! It is a fine scheme—for Mr. Stead, and so much less vulgar than the manoeuvrings of the common promoter . . . Mr. Stead takes no risk, and has carefully provided against the unpleasantness of foreclosure."

The *Globe* says:—"For our part we wish the new venture all success. Mr. Stead has already told us what the ideal paper should be, and his journal is sure to be original if it is nothing else. He will be 'limited' only in the financial sense of the word, we may be quite sure; and we anticipate amusement, if not profit, from his return to daily journalism."

The *Daily Graphic* points out that "Ingenious as Mr. Stead usually is, he has really surpassed himself in the ingenuity with which he surmounts the initial difficulty—the discovery of capital. . . . Mr. Stead has hit upon the brilliant idea of making his customers finance their own paper. . . . Could anything be more delightfully simple? It is simply the system of co-operation carried into journalism. Moreover, the readers of the paper will naturally abstain from reviling it when it does not please them for fear of damaging their own property, so that the editor is assured of an always contented public. The idea is really immense. Mr. Stead has good reason for his belief in himself."

DAILY PRESS OF THE PROVINCES.

The *Sheffield Independent* (which published the first article that Mr. Stead ever wrote) does not doubt

Mr. Stead's ability "to turn out an eminently readable sheet, and to obtain, even if he does not retain, a very large constituency. . . . A daily paper with an ideal far transcending anything to which the ordinary secular newspaper expects to attain, will be welcomed by the main body of journalists, who will watch its inception and progress with friendly interest, even though some of them deem the project chimerical. . . . It is difficult to know which is most to be admired: the daring programme which embodies the policy of the new paper, or the scheme by which Mr. Stead proposes to raise the necessary capital to start the journal, and to give his friends a handsome share in the first-fruits of his labour."

The *Sheffield Telegraph* says:—"Mr. Stead has an idea. He is a man of ideas. His head is as full of them as a rabbit warren is of rabbit burrows. . . . Mr. Stead is still in the Land of Enchantments. He has been to the Forest of Dean and back. Yet he clings with pathetic fervour to his belief that by the aid of W. T. Stead this world will be an angel world by-and-by."

The *Liverpool Mercury* thinks the scheme may prove "a form of investment undreamt of by newspaper projectors before."

The *Manchester Examiner* admits that "the idea of starting a paper without any capital beyond what its prospective readers contribute is a good one, and would afford still greater satisfaction to journalists if there was any likelihood of its being suggested invariably with success."

The *Leeds Daily News* "fails to see the need for a Paper of Papers, which shall provide a morning service of Modern Babylon and Mahatmas."

The *Leeds Evening News* declares that "Mr. Stead's latest idea is worthy of him. Now that he has explained it, everyone will recognise its value. . . . That Mr. Stead's paper will be interesting if it comes out we have not a doubt."

The *Yorkshire Post* says that the scheme will be carried out "by a bold application of the confidence trick. . . . The subscribers will have the paper whether they like it or not, and so, nominally, they will get their money's worth. . . . Mr. Stead's justification for his audacity is that his paper cannot be started in any other way, because he wants to be as 'free as air,' and subject to no control of any sort in the conduct of it."

The *Yorkshire Evening Post* says that "The point is, Mr. Stead conceives a new mission for a newspaper. . . . The keeper of the Nonconformist conscience, however, wants to be 'free as air,' and subject to no control whatever. . . . Mr. Stead's belief in the faith his readers repose in him must have been great before he could launch his stupendously conceited programme for a daily newspaper without capital. . . . We know of only one other man capable of the hardihood of such a proposal—he is 'General' Booth."

The *Bradford Mercury* "admires Mr. Stead," and thinks that "For absolute nerve force, or as they say in America, for 'cheek,' he would be hard to beat. . . . We are convinced that Providence has made a great mistake in not calling in Mr. Stead to help in the management of creation. If he can find 100,000 lunatics to supply him with the money to run his projected paper, according to the Articles of Association, he will certainly deserve the distinction of being the first journalist who has ever accomplished the feat."

The *Bradford Observer* exclaims, "How he ever got in this old-fashioned hemisphere is a continual marvel. Some old pilgrim father must have stayed at home who ought to have gone to America. However, English life

at the end of the nineteenth century is distinctly livelier for the mistake of Mr. Stead's great-grandfather, and we do not in the least want to blame him . . . His project is worthy of John Law. But will it float and will it swim? The 'scheme' is ingenious and attractive. Mr. Stead is a masterly journalist when he will stick to his last, and the public may have faith in him as a manager."

The *Nottingham Daily Express* points out that "Mr. W. T. Stead proposes a scheme whereby the British public may provide him with £100,000 wherewith to start a newspaper and drench the world with daily doses of Steadism, instead of the present patronage of mankind in monthly instalments. . . . This proposal is the most amazing exhibition of inordinate vanity and irrepressible egotism that has ever appeared in print. . . . Will the public provide him with £100,000 to preach Steadism? —that is the knotty question."

The *Western Morning News* says that "the late editor of the *Pall Mall* does certainly understand the art of increasing the circulation of the journals he conducts."

SOCIETY JOURNALS.

Truth says:—"Mr. Stead, whose flow of novel and sensational ideas causes me much envy, has devised a scheme for a daily newspaper which is to be financed by the subscribers, and managed by an irresponsible editor, who, for want of a better, is to be himself. There is a good deal to be said in favour of this original proposal, always provided the right editor can be found. If 100,000 subscribers at twenty-six shillings per head respond to Mr. Stead's offer, this will prove that they regard him as the right editor, and the problem is therefore solved. For my part, I sincerely hope that the requisite 100,000 subscribers will be forthcoming. We have too long been condemned to take Mr. Stead in small monthly parts. I confess I should like to see him in a daily edition, and I am sure that if he comes out once more in that form he will supply a widely-felt want. Besides, the daily papers sadly need waking up, and there is no one living better qualified to do it than the editor of *THE REVIEW OF REVIEWS*."

The *World* considers "Mr. Stead's proposition for the establishment of a new daily journal is bold, ingenious, and captivating."

Vanity Fair confesses to much admiration for W. T. Stead, who has been "accused of many bad things; he has even been called an able journalist (which in these days is grave reproach); but," continues the writer, "I credit him with much charming audacity, and every one admires audacity in these days, just as (and for the same reason) every one admires success. I am inclined to hope that Mr. Stead will get what he wants; for this able, modest, audacious man should have his chance to do us all good, even if he do himself more at the same time."

Sala's Journal remarks:—"Mr. Stead has done many bold things since he journeyed from the North and pitched his tent in London, but I should doubt very much whether, in his most audacious movements, he has propounded a scheme bolder and more daring than that he now sets forth."

The *Sketch* thinks there is something very tempting about the offer, and says the anticipation of Mr. Stead's "latest" ought to add to the demand for the Christmas Number of *THE REVIEW OF REVIEWS*.

The *Figaro* says:—"The general opinion is that Mr. Stead 'has a bee in his bonnet.' Under these circumstances it will rather surprise me if he succeeds in getting his 100,000 subscribers."

The *National Observer* says:—"The enterprise is, of course, designed merely to give Mr. Stead another oppor-

tunity of pontifying. But while this desirable object is suggested in the prospectus, other purposes are most ingeniously detailed. A bold programme! And yet how simple it is! With a penny paper and a staff of female reporters you may rule the world from the back kitchen."

THE RELIGIOUS PRESS.

The *British Weekly* says:—"We have all along anxiously desired that Mr. Stead should return to the field of daily journalism He is terrible to old-fashioned party men; but those who like honesty, frankness, and insight are always glad to consider what he says, whether they agree with it or not Does Mr. Stead think there are a hundred thousand people in this country who are able and willing to advance 26s. and to wait till July before they get anything? If he is right we may apply to him what Johnson said of Goldsmith: 'Surely never man was so trusted before.' All the same, we hope he is right, and that our anticipations of a probable subscription of under ten thousand will be turned to confusion."

The *Independent* says:—"The ingenuity of Mr. Stead is never-failing. The scheme, with its daring and yet its obvious practicability, has made a profound impression on those who have considered it, and when the preliminary explanation in *THE REVIEW OF REVIEWS* is buttressed by the completer exposition in the Christmas Number, it is extremely probable that the 100,000 small capitalists wanted will be ready."

The *Christian Commonwealth* says:—"We trust our readers will not be incredulous as to the possibility of the journalistic feat suggested. The prophet of *Spookology* who presides at Mowbray House is capable of doing very wonderful things, and his latest proposal may not be wholly a dream after all. . . . No one will question that Mr. Stead has many excellent qualifications for editing such a journal as he proposes, but it is by no means certain that he will draw to his support the classes which he wishes to influence by parading his latitudinarianism. . . . However, we frankly own that we should like to see him try his experiment."

CATHOLIC OPINION.

The *Tablet* remarks that "to apply to a capitalist was to invite control and direction, to both of which Mr. Stead has honest dislike."

The *Catholic Times* says:—"For our own part we heartily wish Mr. Stead every success. Without committing ourselves to all, or indeed to any, of the views which he is likely to develop in the pages of his future organ, we have always felt that a man of his vast energy and originality of thought deserved to possess an outlet which the control of a daily paper can alone give to a born journalist."

THE FINANCIAL PRESS.

The *Financial Times* (in a second notice) says that "the idea is simply audacious; but sublime audacity is a characteristic of Mr. Stead's, which has carried him successfully through more than doubtful ventures. . . . It is quite on the cards that he may get his £130,000"; and a third notice, considering the scheme throughout, concludes, "It is essential to Mr. Stead's plans that he should be free to act without restraint, 'free from control by a proprietor, free from pressure by advertisers, free from the restrictions of sect, and free from the prejudices and passions of party.' In order to secure to him this delightful absolution, the Articles of Association, drawn up by a skilful company lawyer, under his instructions, provide that he is to be permanent governing director of the company for life, that the other directors are to be appointed, removed, or

controlled by him; that he is vested with general powers to exercise all such powers and do all such acts as may be exercised or done by the company; that he shall conduct his proceedings in such manner as he shall in his absolute discretion think most convenient; and that his declaration as to the amount of the net profits of the company shall be conclusive. The investing public are, however—no doubt to their poignant regret—deprived of the privilege of taking shares in the ordinary way in Mr. Stead, Limited. The only part they can play in the business is to subscribe for his paper, on the clear understanding that, however much they may disagree with his policy or condemn his methods, no money will be returned. If they respond to his appeal, he will be able to start his paper, to air all his own peculiar crotchets, to adopt whatever sensational methods he may think fit, to attack whom he likes, and castigate what sects and parties he chooses, with absolutely a serene indifference to the subscribers' feelings, and with no fear of a board of cavilling directors, or of an angry body of shareholders figuratively ready to rend him in pieces. It is certainly not within the province of the established press to determine to what extent there is a demand for a revival and extension of the new Jerusalem à la Stead. The fact that Mr. Stead himself recognises the existence of a want ought to be sufficient. Nor shall we venture to dispute his claim to a genius for eclecticism and to a consistency which, like Clive's moderation, is surprising to himself."

The *Bullionist* thinks the scheme "a decided advance upon mere underwriting."

The *Investors' Guardian* acknowledges that "The scheme is charming, and no doubt will be applied in future, not only to new papers—or any other enterprises—but also to old-established organs that are in danger of fainting by the wayside."

The *Financial Observer* thinks that "colossal faith is required," and that the scheme is "simply an ingeniously disguised proposition to the British public to play an elaborate version of 'heads I win, tails you lose.'" . . . This paper goes on to say: "In placing the Daily Paper Company before the public, Mr. Stead, we are convinced, has no desire to make money out of ignorant people. Indeed, even were such his object, he could hardly hope to achieve it by a concern constituted in such an unbusiness-like manner. He is influenced wholly and solely by vanity. If the public choose to minister to another man's vanity at a charge of twenty-six shillings a head per annum, we have nothing to say in the matter."

Money and Trade thinks that "What Mr. Stead apparently wants is 100,000 idiots to find between them £130,000 to enable him to bring out a journalistic enterprise which he is to be free to edit and control as he pleases." As for the promises made, *Money and Trade* asserts that "No financial man would treat such promises as being worth the final whiff of a penny pickwick."

SCOTTISH OPINION.

The *Glasgow Evening News* considers the "new departure as bold and egotistical as all the others. . . . It is perhaps a novel arrangement, but, as we have already said, the new and original is naturally the basis of the undertaking."

The *Aberdeen Free Press* says:—"The ideal newspaper is coming and the ideal editor has come. Who but Mr. Stead should be the ideal editor, and whose but his the ideal newspaper? . . . It is certain that every one will buy and read the ideal paper. The ideal editor thinks it might appear by the first of July next."

The *Dundee Advertiser* thinks "the scheme is a bold

one; but it doubts whether Mr. Stead will find 100,000 subscribers who will have perfect confidence in him both as editor and financial manager."

The *London Scotsman* says:—"Mr. Stead proposes hastening on the millennium. He is a very clever man, with a personality strong enough to command attention, even when he wanders into the region of spooks and other uncanny subjects. He has a way of his own of having us by the ears and generally acting the part of a 'troubler of Israel.' Therefore most people would probably prefer the advent of the millennium to be postponed."

IRISH PAPERS.

The *Freeman's Journal* considers "The manner in which Mr. Stead proposes to establish his new daily paper the most ingenious specimen of *fin de siècle* journalistic enterprise yet witnessed. Mr. Stead describes himself, in effect, as the only possible editor; and certainly he is the only man living capable of conceiving or propounding such a scheme."

The *Dublin Evening Telegraph* remarks that "Mr. W. T. Stead is one of the most versatile men of the age. Since he severed his connection with the *Pall Mall*, nay, long before that, he has supplied more sensations than any man we know of."

The *Cork Herald* admits that "with all his fads and crotchets, political and psychical, Mr. Stead is a brilliant journalist, and his claims to the editorial chair of this new organ, as presented by himself, are certainly plausible, and . . . we have no doubt that the public will watch its development with interest."

TRADE ORGANS.

The *Newsagent* says:—"This is a very clever idea, the operation of which will be, that while not spending his own money, Mr. Stead will be absolute proprietor; and if the venture is a success he will in the course of time pay off the debentures and have no financial interests other than his own to consider. At the same time there is nothing to grumble at in the arrangement, which as far as we can see is perfectly fair to the public."

The *British Colonial Printer* thinks that "if Mr. Stead secures his 100,000 prepaid subscriptions, and manages to steer clear of rocks for six months, he will have a right to consideration as one of the cleverest financiers connected with the profession of letters."

SPORTING AND OTHER PAPERS.

The *Referee* is "sure the scheme is a sound one, because, apart from a peculiar taste in ghosts and moral investigations, Mr. Stead is a straightforward, sensible man of business, and a born journalist."

The *Sportsman* says that "it is an alluring offer, but perhaps after all it would be best to have a bit on a gee-gee at starting price. Horses are queer cattle sometimes to have to do with. But a new daily paper, edited and controlled by Mr. W. T. Stead? Ah!"

The *Licensed Victuallers' Gazette* declares that "The editor of THE REVIEW OF REVIEWS can never be accused of a want of boldness and daring, nor can it be said that he attempts to hide his light (and learning) under a bushel, for he has a keen conception of looking after number one, and is the most enterprising journalist of the present age. . . . Mr. Stead deserves all credit for his pluck in formulating such a very skilful sprat-to-catch-a-whale scheme—for that is the correct term for it—and the eventual catcher of that whale is Mr. Stead."

The *Bath Weekly News* acknowledges that "Mr. Stead, always daringly original, was never more so than in his latest scheme, that of a new daily paper which very nearly approaches co-operative lines."

THE PROGRESS OF THE WORLD.

LONDON, November 1, 1893.

The Matabele War. What was feared by many and desired by some has come to pass. War has broken out in South Africa. On October 2nd a telegram arrived announcing that the Matabele had fired on the British police near Fort Victoria and then departed, 7,000 strong, towards the north-east. Sir Henry Loch, High Commissioner at the Cape, was convinced by this act that the Matabele were bent on war, and charged Dr. Jameson, the Administrator of Mashonaland, to take all necessary measures for protecting British lives and interests in that region. Dr. Jameson immediately decided to take the offensive. On October 5th, between one and two hundred miles away to the south-west, a patrol of Bechuanaland police was fired upon by Matabele warriors, who retreated under a return fusillade. Major

Goold Adams, the chief of this police, was accordingly instructed by Sir Henry Loch to proceed against Lobengula from the south. On the 14th he was reinforced by 1,700 well-armed Bamangwato troops commanded by their King Khama, who, by the bye, is described as at once devout Christian, crack sportsman, and elaborate dandy. On the 15th a skirmish took place between Dr. Jameson's scouts, in which one of our men was wounded and twenty-two of the Matabele killed. This was the prelude to two small battles on the 16th. The British column from Victoria attacked and defeated the Matabele at Indaima's mountain, a spot midway between Salisbury and Buluwayo. At the same time, and at only a little distance away, the enemy was beaten and driven back by the column from Fort Salisbury. One hundred Matabele were slain, and one British

officer. The two columns immediately afterwards effected a junction, and advanced together through the enemy's country.

The Forces and Routes of Invasion. The plan of invasion appears to be easily intelligible. On the west, Dr. Jameson, having successfully combined the troops from Forts Salisbury, Charter, and Victoria, is marching some 1,400 strong eastward, towards Buluwayo. On the south, Major Adams has united the column from Fort Tuli (consisting of 300 volunteers) and Khama's 1,700 men, with 500 of his own police, and is moving northwards towards Buluwayo.

Thesetwo little armies are intended to meet on the road, and then to strike at the king's kraal. Some difficult mountains, with dangerous passes, intervene. The Company's troops talk, if successful, of driving Lobengula and his warlike tribes, bag and baggage, beyond

the Zambesi. Mr. Rhodes, who arrived at Salisbury shortly after fighting commenced, foretells a speedy end to the campaign, and "wants no help." Certainly, if it is not over before the rainy and unhealthy season which comes in with December, the outlook will not be pleasant for the troops.

So much for the progress and prospects of the war. Who is morally responsible for its outbreak is another and apparently much more intricate question. Mr. Rhodes declares that the trouble arose because the Chartered Company would not allow Lobengula to continue his man-hunting in Mashonaland. A young settler writes home that his parson calls the Company's military enterprise an "apostolic mission." South African sentiment seems to be pretty fairly voiced by that parson. Unfortunately the information as yet

SIR HENRY LOCH.

MR. CECIL RHODES.

(From photographs by Russell and Sons.)

received here—whether by reason of its extreme meagreness, or from some other cause—has not availed to convince all home-staying Englishmen that this march on Lo Ben's kraal is quite apostolic in its character. The proximate cause of war seems slight. It looks very much as if Mr. Rhodes had made up his mind that the Matabele horde must be smashed, and, since the Home Government would not let him begin the process unless he were first attacked, he did not need or want to wait for more than formal provocation. If this be the case, then arises the further and much debated question, Were the grounds which led Mr. Rhodes to decide on smashing the impis ethically adequate? He is represented on the one side as the very embodiment of commercial unscrupulousness, only eager to extend the domain, or bolster up the fortunes, or avert the exposure, of the British South African Company, and careless what lofty purpose he simulates, or what blood he causes to be shed. On the other side, he is glorified as the great Imperial genius, the one able man in South Africa whom the nation can trust, the apostle of civilisation, and the patron of Christian missions, who is engaged in executing long delayed justice on a murderous and treacherous people.

The Rights of the Native. The great mass of people who, in the absence of the requisite information, prefer to pass no extreme judgments, have, however, reason for fearing that the rights of the native are not too safe in the hands of the Company's servants. There are dark rumours about, which painfully recall the Rearguard Scandals. According to one report which Sir Henry Loch has transmitted, two indunas who came to Major Goold Adams' camp on the 18th as envoys from Lobengula, were shot by the British guards. If these grave charges are substantiated, nothing will suffice save the most exemplary punishment of the offenders and the most ample amends to the nation we have wronged. Fortunately for the English name, the settlement which will follow on the close of the hostilities will be in the hands of the Imperial Govern-

ment. A Grand Inquest will then presumably be held, when we may hope to get to the bottom of the whole sad business. Possibly arrangements will be made to prevent any Company, however favoured or worthy of favour, from hereafter involving the Empire in even the smallest of wars. It is not too much to hope that not less effective precautions may be taken nearer home for the prevention of those industrial conflicts which practically amount to civil war.

Dispute in the Coal Trade.

The dispute in the coal trade, which has paralysed the industry of the Midlands for over three months, continues to add its quota to the elements of distress which render our winter outlook both sad and sombre. Last month for the first time an attempt was made at mediation. The mayors of the leading towns within the area of the dispute succeeded in bringing masters and men face to face, with the result that the forty per cent. reduction dwindled at once to fifteen per cent. The mayors proposed as a compromise that, inasmuch as

OUR ALLY, KHAMA, CHIEF OF THE BAMANGWATO.

the price of coal had risen owing to the dispute, the pits should be opened at the old rate of wages, but that at the beginning of December the men should accept a reduction of ten per cent. It was further suggested that a board of conciliation should be established. The mayors' proposal was rejected by a majority of both sides. In certain districts the pits were opened at the old rate, by which means the area in dispute contracted, until, of the 270,000 men reduced to idleness at the beginning, 70,000 resumed work, leaving 200,000 still at play. Each side protests that it has no option but to go on fighting, the one for fifteen per cent. reduction, and the other for the maintenance of the old rate of wage.

The Point in Dispute. Apart from the widespread suffering which it occasions, the dispute is not one which calls for much remark. An attempt has been made in certain quarters, notably by the *Daily Cronicle* and those public bodies which take their cue from the columns of our energetic contemporary, to represent the demand of the miners that the old rate of wage should remain untouched, as if it were the formula of some great advance in the labour movement. It is nothing of the kind. The real question at issue, which is far more im-

portant than what is called a living wage, or the question of the standard of measurement which should be used in apportioning the share of profits to which labour is entitled, is the question whether or not a strike against arbitration should receive the support of the public. The miners may be perfectly right in desiring that their wages should be measured by a particular yardstick, but that question is one of mere detail. It is not even a question of a living wage. It is quite obvious that the miners might conceivably earn much less when paid at the higher rate of wage than they would earn at a lower rate per ton if they were able at the same time to invest more of their surplus labour in wage-paid work. At present it seems to be the accepted notion of many of the leaders and advisers of the working man, that the shortest cut to the millennium is by artificially increasing to the uttermost the numbers of hours and days in which men are unemployed.

A Question of Measure Stick. It is a curiously inverted political economy which foams at the mouth at the suggestion that the miner might be better off if he were paid thirty shillings a week under one system, than if he were only paid twenty shillings a week under another system. That is what we have virtually come to. What the miners are contending

From the Moon.]

A SOUTH AFRICAN VIEW OF THE QUESTION.
JOHN BULL (not knowing all the circumstances): "Let them go, Sir Henry, but mind you look after them!"

for is, not that the weekly earnings shall reach a certain figure, but simply that for each ton that is hewn they shall be paid a certain number of shillings and pence. Six working days a week at five shillings a day would certainly be better for them than ten shillings a day if they could only obtain two days' work in the week. I am not saying that these are the actual figures involved in this dispute. I simply desire to call attention to the fact that the whole of the dispute turns on a matter of detail, which in many cases operates to reduce the net weekly wage of the miner instead of increasing it. Of course the miners have a perfect right to stand out for any scale of payment they prefer; the absurdity comes in when they insist that by demanding one particular artificial method of apportioning the value of their labour, therefore they are heroically inaugurating the millennium. They are doing nothing of the sort. They may be right or they may be wrong; but if they were as right as they claim to be, it would not compensate for, much less excuse, the injury which they have inflicted upon the cause of labour by their refusal to arbitrate.

Why was
Arbitration
Refused?

It is said by some who seem to have a very imperfect idea of the machinery of arbitration which has long been in practical operation in the north of England, that the miners would not arbitrate because the arbitrator would have based his awards solely upon the selling price of coal. That is simply nonsense. It was perfectly possible for the miners to have accepted arbitration on the distinct understanding that the arbitrator must take into consideration other questions than the selling price of coal. If the owners had insisted upon narrowing the basis of arbitration, or upon forcing the men to accept a basis which they considered unjust, they might have struck without putting themselves in the wrong before the world. Unfortunately for their own interests, they did no such thing. They struck against arbitration pure and simple. They would not listen to it, and they have brought upon themselves and their class not merely a widespread suffering, but the slur which rightly falls upon those who betray a cause with which the permanent interests of their order and of humanity are vitally bound up. Since, however, the Federated Coalowners proposed a week ago to meet the miners' representatives, in order to "discuss the whole question without prejudice to the position of either party at an earlier date," the miners have decided to accept the offer, which brings with it a prospect of some sort of rational settlement.

The Influence of the Press. The part taken by the *Daily Chronicle* is a notable illustration of the influence which can be exercised in a trade dispute by an organ of public opinion. I do not think I am exaggerating in saying that the strike would have collapsed long ago but for the energetic bottle-holding of the *Daily Chronicle*. Whether in the long run the miners will have occasion to thank their zealous champion remains to be seen. But no one can doubt that Mr. Fletcher and Mr. Massingham have between them prolonged the strike for at least another month. It is a pity that so much zeal, energy, and enthusiasm should not be displayed in a better cause.

What of Home Rule Next Year? The miners' question has had the freer access to the public ear, because of the political lull which parts the summer and autumn sessions of Parliament. But the lull has not been unbroken. The anniversary of the death of Parnell gave Mr. John Redmond occasion to make a speech not exactly fitted to deepen public repose. Much that he said was doubtless both irritating and disappointing to men on this side of the Channel, who had worked hard for years in the Irish cause. But no feeling of this kind

MR. J. E. REDMOND, M.P.
(From a photograph by Lawrence, Dublin.)

should obscure perception of the main merit of his speech; its demand for a definite Home Rule policy for the future. It is idle to imagine that while the Irish Party holds in its hands the life of the Ministry, the question of Home Rule can be "hung up" for an undefined period. It is still more absurd to suppose that the whole of the next Session can be sacrificed to another Home Rule Bill, to be cast out in its turn by an overwhelming majority in the Lords. The problem before Ministers is so to arrange matters next year as to convince Ireland that Home Rule is not relegated to a back seat, and at the same time to carry through measures which have been long promised to Great Britain. Both conditions can be realised. Let the Government bring in a measure authorising the formation, in the recess, of an Irish National Convention at Dublin for a thorough

discussion of the provisions of the next Home Rule Bill. Such a Convention would be in accord with Colonial precedent. It would enable Ireland to formulate and articulate precisely what she wants. It would be an instructive and educative experiment in Irish self-government. And while not relieving the Imperial Parliament of the responsibility of revision, and finally of legislation, it would make that task immeasurably lighter. All that is necessary is a very short series of provisions to the effect that the Convention consist of all the Irish members of the House of Commons, that it assemble in the next recess, that it consider the various Home Rule Bills that have been brought forward, that it draft a measure embodying its own

From *K (adler-ratsch.)*

A GERMAN VIEW OF THE QUESTION.

The Home Rule Bill will not be brought forward in the House of Commons next Session.

conclusions on the subject, and that it present this by Christmas, 1894, as a report to Imperial Parliament and as a basis for a Bill to be introduced in the following year. The passing of such a simple measure need not long occupy the House of Commons, and would then leave it free to attend to arrears of British legislation. The Lords would throw out such a Bill? That is a pastime they need not be indulged in. What is to hinder the thing being done, not by Bill, but by resolution? The Commons could surely constitute all its Irish members a National Committee to consider and report on any measure referred to it. But whatever may be the intentions of Government, the sooner they are made

known the better. Only frankness will dispel such charges of "promiscuous mystification" as Mr. Goschen brought forward at West Hartlepool. The opposite pole in the Irish difficulty was prominently advertised by the meeting in Belfast on the 24th ult. of the Ulster Defence Union, which claim to have a membership of over 170,000 adult males. Lord Salisbury's references to the Irish question in his speech at Ormskirk during the previous week were scarcely of a kind to promote its pacific settlement. They markedly contrast with his state manlike insistence on the absolute necessity of maintaining our command of the seas. By it means let the Navy be strengthened, and the vital strategic value of Ireland to Great Britain fully recognised; but for an ex-Premier to persist in describing the majority of the people thus commandingly situated as "bitterly hostile," is positively to weaken our Imperial defence. The progress of the Parish Councils Bill in public favour is attested by the express endorsement of it in principle by Lord Salisbury on the one hand and by the Archbishop of Canterbury on the other—the official leaders of the only two organisations whose opposition might have been feared. Conservative and clerical criticisms are directed only to details of the measure.

The kindred but much more controverted movement in favour of the Direct Vote "Resident Adult" has been approved by the Labour leaders in a special manifesto. Lord Randolph Churchill's speech to the country brewers on Licensing Reform on the 23rd ult. may prove to be memorable for the appearance of "the resident adult" as a recognised claimant for some sort of local franchise. "Resident adult" as a term of common gender, and as a substitute for "ratepayer," shows how politics are moving on towards the ideal of complete colour-blindness to property and sex-distinctions. The democratic idea—that a soul's a soul for a' that—goes on steadily leavening the whole social lump. Expounded as the doctrine of "One throat one vote" (to quote the happy phrase of the *Westminster Gazette*), it wins the applause even of "the Beer age." Understood as demanding for One Mouth at least One Meal a day, it is forcing our statesmen to consider anew the needs of the evicted in Ireland and of the unemployed in London.

The change it has produced in our social relations was suggestively illustrated in the case of Sir John Gorst at Shoreditch on the 10th, and Sir Charles Russell at Hackney on the 16th ult. It has not often happened that within

seven days of each other a Minister and an ex-Minister, the one a Liberal, the other a Conservative, have met on such equal footing the workless working men of East London, and have together gone so far towards acknowledging the common right to work. A similar spirit has pervaded the ecclesiastical gatherings of the autumn. The Church Congress, which met in Birmingham on the 3rd, was distinguished by a marked increase of sympathy with democratic and sociological movements. The cult of the working man had manifestly many clerical votaries. The new social temper did not, however, move much in the direction of favouring association with other religious bodies, if one may judge by the reception of the Bishop of Worcester's allusion to Reunion at Grindelwald. We shall evidently have to wait some time before Christian Churches are as ready to combine for common ends as the most worldly of States have been for centuries. How long will it take, one wonders, to bring democratic Baptists and prelatial Anglicans up to the pitch of fraternity which may now prevail between, say, a highly civilised republic and an absolute autocracy? At present they will not so much as grant passports!

The Franco-Russian Friendship. Though the war-cloud lowers over Africa, the European firmament is for the time unusually serene. The storm-centre has been transformed into its opposite. France has risen into an ecstasy of peace. The visit of the Russian

that port on the 29th. During the fortnight which intervened, and pre eminently during the nine days (16th to 24th) spent in Paris, he and his officers

THE LATE MARSHAL MACMAHON.

ADMIRAL AVELLAN.

fleet, which was anticipated with grave international anxiety, not merely passed off without one untoward incident—it proved to be one of the most rapturous demonstrations of international amity which this generation has seen. Admiral Avellan arrived with his squadron at Toulon on October 13th. He left

were accorded one long—almost overwhelming—triumph of welcome. The great heads of State, from the President downwards, fêted them; *Te Deums* were sung in the churches on their arrival; the provincial municipalities sent representatives; the people turned out everywhere in enormous crowds to greet them; gifts of all kinds poured in upon them,—in Paris alone they received presents estimated at a value of £100,000. The whole nation gave itself up to transports of joy. Phlegmatic Englishmen doubtless felt inclined to laugh as they read of French officers carrying the Russian guests on their shoulders, of French ladies pressing forward to kiss them in the open streets, and of the other hundred and one ebullitions of unconventional emotion. But the significance of the event is much more than humorous. It showed once more the pacific purpose of the Tzar, whose restraining influence was strong not merely on his officers, but on their guests. It showed that France, when put upon her honour, could repress her bellicose impulses. A zealot who did so far forget himself as to cry, "Down with Germany!" was actually mobbed by the French crowd. Best of all, it has restored France to good humour with herself, which is a necessary step to getting into good

humour with the rest of the world. She feels no longer isolated and depressed. Her sullen brooding over past woes—a mood which is dangerously near to spasms of revenge—seems to have gone, and the opposite extreme, of an overweening self-elation, is not likely to menace peace so long as she keeps her hand in the firm grasp of the war-hating Alexander. It is evident that for his part he has no desire to discourage the fervid overtures of French friendship. He would be a fool if he had. Already it has eased his straitened finances, and a great military power like Russia, that may at any moment be forced into war, cannot afford to refuse the chance of having for an ally a nation with an army of many millions—especially when the chance is flung effusively into his lap for nothing. The death of Marshal MacMahon during the Russian visit to Paris may be taken as a sort of weird omen of peace. The name of the honest old soldier will ever be associated with the names of Malakoff and Sedan. If the antagonisms of the Crimea have now been replaced by the enthusiasm of friendship, who dare say that the bitterer animosities of 1870-71 will never be buried?

In Italian
Waters.

While the Russian fleet lay at Toulon, the British Mediterranean Squadron, under the command of Admiral Sir M. Culme-Seymour, spent a few days at Taranto, and a

ADMIRAL SIR M. CULME-SEYMOUR,
BART.

(From a photograph by Gregory)

few at Spezzia. Our officers received a very kindly Italian welcome at both ports, but great care was taken to avoid anything like a counter demonstration to what was going on in France at the time. Nevertheless, the synchronism was not without significance. There was another, and this not a festal coincidence.

MacMahon died during the Russian visit to his country. The death of Lord Vivian, our Ambassador at Rome, occurred while the British fleet was passing from the one to the other port of welcome. In the honours which attended his funeral, the Italian Government showed its warm appreciation, not only of the merits of the deceased nobleman, but of the friendship of England. In a peculiarly trying time the visit of our fleet seems to have cheered up Italy a little. She has been seriously embarrassed in

her finances. But for the help of the German Government in procuring for her a new loan of two millions sterling, she would not, it is said, have been able to pay the January interest on her existing debt. Signor Giolitti has announced among other measures to meet the strain, a graduated income tax. Germany herself will be put to it to find ways and means to raise the three to four extra millions

THE LATE LORD VIVIAN.

(Photograph by Hughes and Mullins, Ryde.)

sterling which are required under the new Army Bill. The elections to the local German Parliaments have shown a steady increase of Socialism. The Emperor has spoken at one or two public ceremonials, but has mercifully refrained from any

THE GERMAN EMPEROR. A RECENT PORTRAIT.

loud shouting. His most important function has been to lead in the celebration of the military jubilee of the King of Saxony. As an instance of the

rapidity with which old wounds can heal, it is interesting to remember that in 1866 King Albert,

THE KING OF SAXONY.

(From a photograph by Otto Mayer, Dresden.)

then Crown Prince, fought at Sadowa against the Prussians.

But the member of the Triple Alliance which has most astonished the world for Austria! during the month just gone is Austria. At the opening of the Reichstag in Vienna on the 10th Count Taaffe introduced a Bill which proposes the establishment of what is practically universal suffrage throughout the Cisleithan empire. The

COUNT TAAFFE.

grounds adduced for this strikingly new departure were mainly two. First, the struggles and rivalries

between the various national groups in the existing Parliamentary system have resulted in complete chaos. Some change must be made. Second, the Socialist Labour movement has been rapidly extending, and becoming more and more menacing. A vast extension of the franchise would, it was expected, prevent resort to unconstitutional and revolutionary methods. Out of the representatives of the working classes, bent as they are on social reform and caring little for the local and racial particularisms of the present middle-class electorate, there would, it was hoped, be formed a party large enough to make

LORD DUNRAVEN.

(The Owner of the Valkyrie.)

Parliament workable. So the House of the Hapsburgs, despite all its reactionary traditions, practically goes down on its knees before the working man, and prays him to save it and the nation from the curse of quarrelling races and a paralysed Parliament. That this Bill embodies the Emperor's wishes cannot well be doubted, for the consternation and antagonism which the new measure roused among all parties in the Reichsrath—including the Liberals—were so threatening that its withdrawal was generally announced, but an audience with the Emperor strengthened Count Taaffe, and determined him to proceed with it. Then the

Parliamentary parties which had previously refused to work together now united under a common impulse of self-preservation. The Liberals joined hands with their bitterest foes, and Count Taaffe has been compelled to resign. The crisis is not, as we go to press, yet over. A Coalition Government will probably be the issue. But if on the one hand the Emperor and, on the other, the working-classes are bent on the establishment of universal suffrage, the change cannot be long delayed.

The Silver Struggle. The Bill for the repeal of the purchase clauses of the Sherman Silver Act has at last passed through the American Senate. The struggle which has thus ended has been one of the most extraordinary ever waged in an English-speaking legislative body. The opponents of the measure resorted to every device of obstruction that their ingenuity could devise. One sitting continued for the portentous period of thirty-eight consecutive hours, and Senator Allen, of Nebraska, immortalised himself by a "record" speech of fifteen hours. Efforts were made to bring about a compromise, but President Cleveland stood firm. To escape from the deadlock something of the nature of a Presidential *coup-d'état* was suggested, but happily only suggested. After a continuous session of fourteen days, and a debate of sixty-one days, the Bill was carried on the morning of the 30th ult. by forty-three votes against thirty-two. It is said that the President intends to summon an International Council to consider the Currency Question. An international currency will arrive some day, one may suppose; and the projected Council will be another step towards that desirable consummation.

Close of the World's Fair. The speeches made during this debate, as reported by the official record, make up a sum of about 20,000,000. That gigantic total is a million and a half below the number of paid admissions (21,458,910) to the World's Fair, Chicago, during its six months' season. It is satisfactory to learn that the fears of the promoters of the Fair being involved in heavy financial loss have been dispelled. In all else that is of essential moment the great international festival has turned out a phenomenal success. Chicago has won her proudest laurels. But a shade of tragedy mingles with the triumph. The Mayor of Chicago was assassinated by a disappointed office-seeker two days before the Fair was closed. But probably none of these events have excited half as much interest

on this side of the Atlantic during the last few years as the contests between the yachts *Valkyrie* and *Vigilant*, which resulted in the complete victory of the latter.

ADMIRAL DE MELLO.

The Moor and the Spaniard. Spain is finding the defence of Mel a very serious business. The Moors have made attack after attack upon new redoubts, and on the 27th ult., their numbers having risen to 30,000, they succeeded in ousting the Spaniards. They were driven out next day, but only after hard fighting; in which the Spanish General Margallo was killed. The civil war in Brazil continues. Admiral de Mello has proclaimed one of his captains, Lord by name, provisional President of Brazil. The bombardment of Rio has been suspended.

Sir Henry Norman has after all declined the Viceroyship of India, and after a considerable delay it was announced that Lord Elgin had consented to fill the office. The new Viceroy has virtually his record to make.

A Generous Australian Offer. The outbreak of war in South Africa has elicited a fresh reminder of the strength of those intercolonial ties which almost hold together the English-speaking race. And so more we owe it to the generous impulses of your Australian blood. Scarcely had the news been received of the commencement of hostilities than the officers of the Bendigo Militia made an offer to the Victorian Commandant of a hundred volunteers for the South African campaign.

DIARY FOR OCTOBER.

EVENTS OF THE MONTH.

- Oct. 1. New Draft Treaty and Convention accepted by the Siamese Government.
The New German Army Bills put in force.
Capitulation of Rosario, to the National Troops.
Storm in the Gulf of Mexico. Over 2000 lives lost.
2. Appointment of Lord Bowen, Sir A. Rolit, and Mr. R. B. Haldane, as Commissioners, to inquire into the Featherstone Riots.
Publication of the Text of the Franco-Siamese Treaty and Convention.
Swedish election results announced.
Report received of the Matabele attack on the South African Company's Police near Fort Victoria.
Opening of the Medical Session in London.
Opening of the Autumn Session of the Baptist Union, at Reading.
Opening of the Danish Parliament.
Opening of the Norwich Musical Festival.
Fighting between Spaniards and Moors at Melilla.
Arrest of Dr. Alem, Radical Leader in the Argentine Insurrection.
3. Duke of York presented with the Freedom of the City of Edinburgh.
General Sir R. Biddulph appointed Governor of Gibraltar.
Meeting of Coalowners at the Westminster Palace Hotel. Reduction of Wages adhered to.
Annual Congress of Railway Servants at Glasgow.
Further Bombardment of Rio stopped by the War Vessels of the British, French, Italian, United States and Portuguese Governments.
4. New Park opened at Stockton by the Duke and Duchess of York.
Arrival of the British Mission at Cabul.
Elections for the Lower House of the Hessian Diet.
5. Further Bombardment of Rio.
Duke of York presented with the Freedom of York.
Discussion on Corporal Punishment by the London School Board.
Matabele Attack on Bechuana-land Police.
British Mission at Cabul received by the Amir.
6. Appointment of Bishop R. Machray as Primate of Canada.
Close of the New Zealand Parliamentary Session.
Execution of the Spanish Anarchist, Pallas.
Commemoration of the Anniversary of Mr. Parnell's Death.
Close of the Railway Servants' Congress at Glasgow.
Close of the Norwich Musical Festival.
Awards made at the National Workmen's Exhibition distributed by the Lord Mayor.
Ministerial Income Tax Bill defeated in the Tasmanian Assembly.
Constitution Bill, virtually granting Manhood Suffrage, passed by the Houses of Parliament of Western Australia.
New Public Library opened at Colchester.
7. Annual Labour Party National Congress at Paris.
Review of the Metropolitan Fire Brigade in Hyde Park.
Chief Men concerned in the Argentine Revolt exiled.
Opening of the Beira Railway in South Africa.
8. Anniversary of Mr. Parnell's Death commemorated at Dublin.

9. Opening of the Latin Monetary Conference at Paris.
Opening of the New South London Art Galleries, Reading Room and Lecture Hall, and the Camberwell Central Public Library, by the Prince of Wales.
Foundation Stone of an Institute for Seamen at Poplar laid by the Duke and Duchess of York.
Conference of Mayors at Sheffield, on the Coal Crisis.
Rejection of the Tasmanian Income Tax Bill by the Legislative Assembly.
Memorial to the late Archbishop Magee, unveiled by the Duke of Rutland in Peterborough Cathedral.

THE LATE ARCHBISHOP OF ARMAGH.

(Photograph by Magill, Belfast.)

- Autumnal Session of the Congregational Union opened.
10. Secondary Education Conference at Oxford.
Annual Meeting of the Incorporated Law Society at Manchester.
Conference of the Association for the Reform and Codification of the Law of Nations, at the Guildhall.
First Congress of the Photographic Society of Great Britain at Pall Mall East.
Dairy Show opened at Islington.
Formation of a new Natal Ministry with Sir John Robinson as Premier.
Close of the Coal Strike in Belgium.
Opening of the Austrian Reichsrath and Introduction of an Electoral Reform Bill by Count Taaffe.
Conference of Lady Guardians, at Lancaster Gate, on the Aged Poor.
Meeting of Coal Owners at Derby to discuss their Position. Compromise proposed.
First Meeting of the Bureau of the International Peace League.
11. Earl of Elgin appointed Viceroy of India.
Conclusion of the Oxford Conference on Secondary Education.
Conclusion of Incorporated Law Society's Conference.
Lord Ripon presented with his Portrait by the West Riding County Council.
12. Brazilian Government Forces defeated by Insurgents at Quaraby.
Final Meeting of the Photographic Congress.
Meeting of the Miners' Federation to consider the Proposals of the Sheffield Conference.
Close of the Conference on the Law of Nations.
Fatal Collision between the Mail Packet *Princes Marie* and a Schooner off the North Foreland.
The President of the Guatemala Republic declared himself Dictator.
13. The American Cup won by the American yacht *Vigilant*.
Accident on the Michigan Central Railway. Many killed.
Closing Meeting of the Congregational Union.
Annual Meeting of the Architectural Association.
News received of a Collision between the Russians and the Afghans in the Pamirs.
Arrival of the Russian Fleet at Toulon.
Debate on the Silver Question in the United States Senate adjourned.
Announcement of the Extension of the Swaziland Convention till June 30, 1894.
Pecree issued by the Brazilian Government declaring the Insurgents debarred from all their rights.
14. Festivities in Toulon in honour of the Russian Fleet.
Collision between the Belgian Mail Steamer *Marie Henriette* and a Danish Schooner. Five lives lost.
15. Labour Demonstration in Hyde Park in aid of the Coal Strike.
Monument to Garibaldi unveiled at Genoa.
16. Visit of the British Squadron to Taranto.
Further Strike of Miners in Belgium.
Annual Conference of Railway Workers at Derby.
Laying of Cable from Queensland to New Caledonia completed.
Annual Conference of the National Protestant Congress.
Bombardment of Rio continued.
Defeat of the Matabele near Thana Isenba.
17. Manifesto issued by 140 Working Class Leaders in favour of the Local Veto Bill.
Coal Riot at St. Helens.
18. Close of the Belgian Miners' Strike.
Close of the Railway Workers' Conference at Derby.
Manchester College, Oxford, opened.
Further Rioting at St. Helens.
Two of Lobengula's Indunas killed at Col. Goold-Adams's Camp.
19. Railway Collision at Battle Creek, Michigan.
Sir George Dibbs made the Annual Budget Statement in New South Wales Legislative Assembly.
Opening of the Natal Parliament.
Poor Law Conference at the Society of Anarchists.
Opening of the Featherstone Riots Inquiry.
Sir H. N. Stewart elected City Marshal.
Festivities in Paris for the Russian Squadron.
Renewed Rioting at St. Helens.
20. Early Closing Congress at Nottingham.
21. Daniel and Constance Phelan sentenced to six and nine months' hard labour, respectively for cruelty to their children.

- Departure of the British Squadron from Taranto to Spezia.
Miner's House blown up at St. Helens.
Anniversary Meeting of the West London Mission.
21. Report received of the Defeat of the Brazilian National Forces at Ibiacy. Many killed.
Coal Owners' Federation offered to submit the Question of Colliers' Wages to Arbitration.
Meeting of Mayors, at the Mansion House, on the Temperance Question.
Annual Meeting of the Metropolitan Board School Teachers' Association, at the Memorial Hall, Farringdon Street.
 22. Celebration of the King of Saxony's Military Jubilee.
Demonstration in Trafalgar Square in favour of Universal Suffrage.
Arrival of Sir Gerald Portal at Zanzibar.
 23. Arrival of the British Squadron at Spezia.
Congress of the Social Democratic Party at Cologne.
Meeting of Mayors, at Sheffield, to consider the Coal Crisis.
Conference of Congregationalists, at the Memorial Hall, on Technical Education.
Announcement received of the Proclamation of Senhor Lorena as Provisional President by Admiral de Mello.
 24. Meeting of Ulster Unionists at Belfast.
Resignation of Mr. Frederick Harrison as Alderman of the London County Council.
Annual Meeting of the United Kingdom Alliance at Manchester.
Conference of Poor Law Guardians at St. Martin's Town Hall.
Close of the Paris Fêtes in honour of the Russian Squadron.
 25. Nonconformist Conference, at the Mansion House, to consider the Spiritual Needs of London.
Festivities in Lyons, in honour of the Russian Squadron.
Opening of the Bristol Musical Festival.
26. Free Church Conference at Portsmouth.
Festivities in Marseilles in honour of the Russian Squadron.
Resignation of Sir T. McIlwraith, Queensland Premier.
Meeting of Coal Owners and Miners proposed by the Coal Owners' Federation, to discuss the Coal Question.
 27. Opening of the Bulgarian Sobranje, by Prince Ferdinand.
Prorogation of the Natal Parliament.
Hon. Hugh Muir Nelson appointed Premier of Queensland.
Deputation to Mr. Fowler, at Wolverhampton, to urge the appointment of a Court of Arbitration for Labour Disputes.
Defeat of the Spanish Troops by the Moors at Melilla.
 28. Meeting, at Peterborough, to consider the Agricultural Depression.
General Margallo killed by the Moors at Melilla.
Opening of the New Science Buildings at Leys School, Cambridge, by Lord Kelvin.
Close of the Socialist Congress at Cologne.
Departure of the Russian Squadron from Toulon.
Assassination of Mr. Carter Harrison, Mayor of Chicago.
Conference, at the Mansion House, on the Unemployed.
 29. Departure of the British Squadron from Spezia.
Prorogation of the Austrian Reichsrath decided on.
Elections to the Swiss National Council.
Demonstration, in Malta, to protest against Lord Ripon's action with regard to the Bishop of Malta.
 30. Silver Purchase Repeal Bill passed by the United States Senate.
Joint Conference of Coal Owners and Miners agreed to by the Miners' Federation.
Conference on Agricultural Training at Preston.
Acquittal of Indian "Oculists" on a Charge of Conspiracy to Defraud.
Report received of Disturbances in Peru.
Close of the Chicago World's Fair.

THE CHURCH CONGRESS AT BIRMINGHAM.

- O. t. 3. Opening of the Congress. Inaugural address of the President, Bishop of Worcester.
Discussion on the Increase of the Episcopate.
Discussion on Education and Lord's Day Observance.

4. Discussions on Church Services and Symbols, Preaching and the Preaching Order, Employers and Employed, Benefice Clergy and Curates, Parish Councils Bill, the Anglican Communion, Home Missions, and the Bishop of Chester's Scheme of Licensing Reform.
5. Discussions on the Church and other Christian Bodies, Science and Faith, Financial Condition of the Clergy, the Church and the Poor, Foreign Missions, Ministry of the Laity, and the Church and State.
6. Discussions on the Church and the Press, and Disposal of the Dead.
Close of the Congress.

SPEECHES.

- Oct. 1. Mr. Dillon, at Sligo, on the Home Rule Bill.
Sir G. Osborne Morgan, in East Leicestershire, on Labour Disputes.
2. Mr. Walter Long, at Ormskirk, on Agricultural Affairs.
Professor V. V. Lewes, at Westminster Hall, on Gas Substitutes.
Mr. John Barry, at Wexford, on His Resignation.
3. Mr. Goschen, at Edinburgh, on the Home Rule Bill.
Mr. Philip Stanhope, at Burnley, on Parish Councils.
Sir Charles Russell, at Hackney, on Education.
Baron von Riehl, in the Bavarian Diet, on the Financial Relations of the Federal States to the German Empire.
Mr. Cyril Dods, at Felsted, on "Poor Law Reform."
4. Lord Randolph Churchill, at Stalybridge, on Home Rule.
Rev. T. M. Morris, at Reading, on the Work of the Baptist Union.
Mr. Albert Spicer, at Chelmsford, on Nonconformist Legislation.
5. Mr. Sidney Webb, at St. Martin's Town Hall, on the Future of London.
Sir T. Sutherland, at the Meeting of the Bank of Australasia, on the Australian Financial Troubles.
6. Mr. Powell Williams, at Aldgate, on the Unemployed.
Mr. S. Woods, at Haydock, on the Coal Crisis.
Lord Londonderry, at Skelton, on the Home Rule Bill.
Mr. Joseph Arch, at Earl's Colne, on the Agricultural Condition.
Mr. Pickard, at Barnsley, on the Mayors' Conference and the Coal Crisis.
7. Duke of Cambridge, at the Mansion House, on the Volunteers.
Lord Roberts, at Bristol, on the Volunteers.
8. Rev. H. Price Hughes, at St. James's Hall, on the Coal Crisis.
9. Lord Randolph Churchill, at Huddersfield, on Home Rule.
Professor Jebb, at Birmingham, on Classical Studies.
Hon. J. B. Patterson, at Melbourne, on the Condition of the Colony.
Mr. John Redmond, at Dublin, on Home Rule.
Mr. Courtney, at Fowey, on Home Rule.
Alderman Ben Tillett, at Grimsby, on the Coal Lock-out.
10. Sir John Gorst, at Shoreditch, on the Labour Question.
Sir Edwin Arnold, at Birmingham, on Aspects of Life.
Bishop of Bath and Wells, at Wells, on Socialism and the Labour Question.
Mr. Albert Spicer, at the City Temple, on the Outlook in Congregationalism.
Mr. John Redmond, at Dublin, on the Future Policy of the Parnellite Party.
11. Mr. Goschen, at Hartlepool, on Home Rule.
Mr. Courtney, at Landrake, on Home Rule, Parish Councils Bill, etc.
M. Dupuy, at Ile-sur-Tit, on His Programme.
12. Mr. Michael Davitt, at Dublin, on the Parnellite Policy.
Mr. Tom Mann, at Poplar, on London Labour.
Mr. H. A. Jones, at the City of London College, on the Relations of the Drama to Education.
Lord Londonderry, at Welshpool, on the Work of the Government.
Mr. Edmund Gose, at Queen's Square, on the Literary Movement during the Last Century.

- Mr. T. W. Russell, at Duncon, on the Home Rule Bill.
Baron Henry de Worms, at Guilford, on Agricultural Prospects.
- Sir G. Osborne Morgan, at Betton, on the Government and Wales.
13. Mr. Courtney, at Penzance, on Reading.
Lord Charles Hersford, at Exeter Hall Gymnasium, on National Physical Exercises.
Mr. H. E. Moore, at St. James's Hall, on Free Labour Colonies.
Mr. T. W. Russell, at Glasgow, on Ulster.
14. Mr. Cecil Rhodes, at Fort Salisbury, on Mashonaland.
Lord Northbrook, at East Leigh, on the Evening Continuation Schools.
Mr. Tom Maun, at Yeaddon, on the Church.
16. Sir Charles Russell, at Hackney, on the Unemployed.
The Bishop of Chester, at Newcastle, on the Licensing Reform Scheme.
The Bishop of Durham, at Sutherland, on Sunday Closing.
Mr. John Redmond, at Waterford, on Home Rule.
Duke of Connaught, at Allershot, on the Army.
17. Lord Salisbury, at Preston, on the Situation.
Mr. Asquith, at Glasgow, on the Programme of the Government.
Mr. Courtney, at Lostwithiel, on Strikes and Arbitration.
18. Dr. Pre Smith, at the Royal College of Physicians on Harvey.
The German Emperor, at Bremen, on the Emperor William I.
Sigmar Glogital, at Dronero, on the Policy of the Cabinet.
Lord Randolph Churchill, at Deptford, on Home Rule.
Lord Salisbury, at Ormskirk, on the Situation.
Mr. Asquith, at Glasgow, on the Mines Regulation Act, and on Seamen and the Employers' Liability Act.
Archbishop Walsh, at Dublin, on the Christian Brothers' Schools and Government Grants.
Mr. S. Montague, at the New Dental Association, on the Metric System.
Mr. Bernard Coleridge, at Sheffield, on the Coal Lock-out.
19. Col. Sanderson, at Portadown, on the Roman Catholic Priesthood.
Earl Cowper, at Luton, on Home Rule.
The Bishop of St. Asaph, at Lees, on the Church in Wales.
Sir E. Grey, at Alnwick, on the Policy of the Government.
The Bishop of Exeter, at Exeter, on the Bishop and the Rejection of the Home Rule Bill.
Mrs. Henry Fawcett, at Toynebee Hall, on Woman Suffrage.
Dr. Martineau, at Oxford, on Freedom in Theology.
- Sir John Rigby, at Kirriemuir, on the Peace Session.
Mr. Pickard, at Hackney, on the Work of the Government.
Mr. A. C. Morton, at Peterborough, on the Situation.
Lord Waterford, at Coldstream, on Home Rule.
20. Mr. Asquith, at Leven, on Home Rule, etc.
Mr. J. T. Bent, at St. James's Hall, on Mashonaland.
Mrs. C. Mallet, at the Humanitarian League, on Dangerous Trades.
21. Sir W. Hart-Dyke, at Dartford, on Education.
Mr. Asquith, at Ladybank, on the Political Situation.
Mr. Courtney, at Downderry, on Mr. Asquith and the Government Programme.
22. Mr. John Redmond, at Cork, on the Release of Dynamite Prisoners.
Mr. T. Harrington, at Milltown, on Home Rule.
The German Emperor, at Dresden, on the King of Saxony's Military Jubilee.
23. Mr. John Redmond, at Cork, on the Evicted Tenants, etc.
Mr. T. Burt, at Leamington, on Labour Legislation.
Lord Randolph Churchill, at the Hotel Metropole, on Licensing Reform.
Count Taaffe, in the Austrian Reichsrath, on the Electoral Reform Bill.
Duchess of Sutherland, at Hanley, on the Drink Question.
Bishop of London, at Nottingham, on the Temperance Question.

Mr. A. McArthur, at St. Austell, on the Work of the Session.
Bishop of Winchester, at Winchester, on Church Defence, etc.
Bishop of Ely, at Cambridge, on Disestablishment.

THE LATE SIR WILLIAM SMITH, LL.D., D.C.L.

Archbishop of Canterbury, at Maidstone, on the Church and Elementary Education.
Lord Lambington, at Liverpool, on Siam.
Mr. Pickard, at Barnsley, on the Joint Conference of Coal Owners and Miners.

CHARACTER SKETCHES.

I.—LOUIS RUCHONNET.

ON Thursday, September 14, a cry of pain as for a personal loss went up from all the cities of Switzerland—a cry, which within the next few hours, echoed and re-echoed from sequestered upland valleys, from villages in remote Alpine passes and from distant Alps, as well as from every part of the world where Switzers have settled—and where are they not in either hemisphere? The sorrow was not confined to one class or to one party; but all classes and all parties seemed to feel that they had lost a personal friend. The sorrow

voiced itself thus: "Louis Ruchonnet is dead." As member of the Federal Council of the Swiss Confederation, a position equivalent to that of a member of the Cabinet in England, Ruchonnet reached the Federal Palace at Berne at 8.30 a.m. on the morning of the 14th. There he presided over a committee of the Cabinet, which met at nine about some important appeals. He was cheerful and gay as was his wont, and said pleasantly about an appeal that was about to be considered, "But who will pay the costs?" At that moment he stretched out his hands, his mouth fell open, and without uttering a sound he sank forward on the desk in front of the armchair in which he was sitting. His colleagues rushed to his assistance, but though the heart still beat feebly it was clear all was over. It was apoplexy of the heart.

Who then was Ruchonnet, and why has the heart of every Switzer been so greatly stirred by his death? To answer this question is the object of this article.

Antoine Louis John Ruchonnet was born at Lausanne, April 28, 1834. His grandfather served in the armies of the French Republic, and in 1847, at the age of seventy-eight, he commanded a company of volunteers sent by Lausanne across the Col de Jaman into the Haute Gruyère at the time of the Sonderbund War. The son of this veteran and the father of the deceased statesman was known by every one in Lausanne, where he reached the great age of eighty-nine, and presided for many years over the Salle des Armes at the academy as fencing master.

Ruchonnet's mother was an English lady named

Boomer, and the first two years of the life of the future President of the Swiss Republic were spent in our country, his parents only returning to Lausanne in 1836. Some of the Swiss papers attribute what they consider his unrivalled skill as a debater to his English ancestry. The Swiss universities are really national institutions. A saving and careful young man, if only the son of a fencing master, can study at one of them, and may have, as in the case of Ruchonnet, the highest honours of the Fatherland before him. From the first he devoted himself to the

study of the law, or as the French say wisely "*de droit*," "of right"—which law ought to be.

In 1858 at the age of twenty-four he commenced pleading in the Cantonal Courts, and at twenty-nine he was elected deputy to the Grand Council of his native state, of which he soon became Vice-President, and at the age of thirty-two he was elected President of the Council. But although Vaud, like the other cantons, is a sovereign republic, it is also a member of the Swiss Confederation, and the best men of every canton are inevitably drafted off to take part in the supreme government.

Thus at the age of thirty-two, in 1866, Ruchonnet was elected a member of the National Council at Berne, equivalent to the House of Commons of the whole of the Swiss Confederation. Here he soon made his mark, while contemporaneously he became the uncontested chief of the

"Conseil d'Etat" of his own canton, the executive government of the Pays de Vaud. These latter arduous duties he laid down in 1874, when he took up again his practice at the bar at Lausanne, where at one time his professional income was 40,000 francs, or £1,600, which for Switzerland is large. It would have been larger but that he was very careless about his fees. Meanwhile, all this time, although he had retired from the executive of his native canton, he remained a very active member of its legislature, the Grand Council.

In 1875 he was elected one of the seven members that constitute the executive government of the Swiss Confederation, but he declined the position. In 1881 he was again elected and again declined, but upon strong pres-

M. LOUIS RUCHONNET.

sure being put upon him by his fellow-citizens in the Pays de Vaud, who were anxious that their canton should be represented upon the supreme executive government, he consented, and he occupied the position with rare distinction until his death on September 14th. All that time—twelve years—he has been head of the Department of Justice and Police. Twice, in 1883 and 1890, he was President of the Confederation of Switzerland, the corresponding position to king in a constitutional monarchy. In 1869 and 1875 he was President of the National Council, corresponding to the position of Speaker of our House of Commons.

It was no great wonder that he did not snatch greedily at the position offered him in the National Executive, for the post is one of excessive toil and the remuneration is small. The President of the Swiss Republic receives 12,000 francs a year, or £480. I have known the private secretary of a simple Member of Parliament in England receive almost as much. Therefore in devoting himself entirely to the service of his Fatherland, he not only gave his life, but resigned such chances of fortune as his practice at the bar might have secured to him. In addition to the administration of justice for the whole of Switzerland, which might well tax the strength of an able man, he laboured incessantly to unify and codify the law for the whole of Switzerland.

Only those who realise that each canton is a sovereign state often of differing race, language, and religion, and formerly with very different laws, can realise how Herculean was the task which Ruchonnet had set himself. He was determined that every Swiss citizen should be sure of justice, swift and cheap, and that his rights should be safe guarded by one law for the whole Confederation. In addition to these labours he frequently took part in Congresses for various objects, often presiding over them—now on the subject of literary property, now on the unification of penal law, and again only last year he presided at the Peace Congress at Berne. Poor man! he needed rest, and he has found it.

This spring he endured cruel sufferings, want of sleep, threatening of suffocation, the anguish of an overwrought brain, nervous system, and heart, and he endured them all with a cheerfulness which was almost sublime. The only complaint was—"A working mason or carpenter is more fortunate than I am. If he is ill he can rest and take care of himself; I have no time to be ill."

The oppressed had always a friend in Louis Ruchonnet. The absurd action of the Swiss democracy in preventing the Jews from slaughtering their animals according to their conscience and their law, met with his determined opposition. While he was a foe to the death to Ultramontanism, he would not suffer his Roman Catholic fellow-citizens to be injured by Protestant bigotry, and no more eloquent words have ever been spoken than those in which he denounced the oppression and the cruelty of the persecution to which the Salvation Army has been subjected in Switzerland. It is to be hoped that his speeches may be collected and studied.

Two short extracts I must translate in this article; the one is from the address he delivered at the great Federal Shooting Festival at Frauenfeld in 1890:—

Our country ought to be a land of liberty. Ah, my dear fellow-citizens, we who are so ready to vaunt our institutions, let us look around us! There are still deep shadows on the picture. There are thousands of our fellow-citizens to whom laws long out of date deny the rights of citizenship, forgetting that in a country of universal suffrage, crime alone ought to forfeit rights, poverty never. And what shall I say of our religious intolerance? Banished from our laws, it retains

alas! its accursed roots in our hearts. Why dissimulate the fact? Let us do better. Let us learn to practise true liberty, which means that each one of us shall respect the beliefs of another as he desires that his own shall be respected.

RUCHONNET AS AN ARBITRATOR.

The other extract is upon the question which is the great glory of Ruchonnet's life, for not only was he devoted to the cause of peace and international arbitration, but in a sense he was an incarnation of international arbitration. On two occasions, as President of the Swiss Republic, he was called upon to nominate arbiters in grave international disputes. To me there is something even grander than the grandest episodes in the golden age of the Roman Republic in the spectacle of a simple Swiss citizen, who probably never possessed a couple of thousand pounds in his life, being called upon to act as supreme arbiter and judge between nations to whom millions would be no consideration—and that with the certainty that corruption is impossible. What then is almost the dying testinony of Ruchonnet on this question of arbitration and peace as given last year at Berne?

Philosophers, economists, statisticians, jurists, eminent men of all countries have become apostles of our aspirations after peace and justice. They adopt an indictment against war which cannot be rebutted. They demand that the claims of civilisation shall be recognised. It is humanity itself that speaks through their lips. But what do we see around us? The states of Europe are constantly increasing their already overgrown and formidable armaments. From the smallest to the greatest each seeks to surpass its fellows in the number and deadliness of its implements of destruction. Men seem to compete with one another in the effort to bring about a cataclysm wherein a reign of violence shall be inaugurated and force shall receive its apotheosis. In the face of this pressing danger our task is clear—it is to enlist men under the banner of peace. Let us everywhere create peace societies, and enrol adherents from every class for common action. Thus shall a real public opinion be organised, which shall compel obedience on the part of the governments.

I cannot close this article without a word about the man; of the statesman I have endeavoured to give a slight picture. Throughout all Switzerland there has arisen a chorus of bitter grief and of praise.

I have asked many, "Was there anything against him? Had the man any faults?" The reply is always the same: "We never heard of anything. We know of none."

Married early in life to a true helpmate, his private life has been irreproachable, and every one says, "He was so pleasant, he was so kind, so disinterested, so generous."

"For scarcely for a righteous man will one die, yet peradventure for a good man some would even dare to die." Louis Ruchonnet was emphatically the *good man*, and hence the touching sorrow that surrounds his bier.

It seems a pity that we can never fully recognise our greatest benefactors and friends until we lose them. It is only when they are parted from us for ever that our eyes are opened, and we say, "Did not our hearts burn within us while he talked with us by the way?"

THE FUNERAL OF LOUIS RUCHONNET.

A special meeting of the "Grand Conseil" of the Sovereign State of Vaud was held on the evening of the death of Ruchonnet—September 14—when it was decided that he should receive a public funeral at the hands and the expense of his grateful and sorrowing Fatherland. The municipality of Lausanne had already decided to offer a

rave for its illustrious son in the beautiful cemetery of a Sallaz. It was well that the family was to be put to no expense, for Ruchonnet died as he had lived, a very poor man. Listen to the testimony of a political opponent :—

The touching sorrow of his friends tells us how good he had been to them. Beyond all else he was absolutely disinterested. No consideration about money ever influenced his public life, and in his private affairs those around him were constantly obliged to warn him against the exaggerated generosity that was natural to him. As an advocate, he never understood how to cause himself to be adequately paid. As a ruler, he never dreamed of making a profit for himself out of the special knowledge of affairs which his position secured to him. He dies without fortune, having had a thousand opportunities of enriching himself. In the age in which we live this is no slight praise, and those who were his opponents are happy to be able to lay this testimony like a funeral wreath upon the tomb about to close upon him.

This more than Roman virtue deserved recognition from the Fatherland, and that recognition was given without stint. A special train left Lausanne early on the morning of the 18th for Berne, to bring back all that remained of the statesman. How he, having left his arduous duties in the Federal Capital, used to exult as the train bore him southwards, as it emerged from the tunnel at Chexbres, and his own loved land, his native canton, and his own lake, unrivalled in loveliness and in grandeur, burst upon his view! And he had been looking forward to retirement and rest among these beauties, and now he comes home on his bier, which is buried in wreaths of the most exquisite flowers. For let no one suppose that a republican government does not know how to manage an imposing public ceremony well. It was a military funeral, and everything was managed with military precision and in perfect order. Five non-commissioned officers of infantry, two of artillery, and two gendarmes, removed the coffin, which was itself plain deal, but suitably draped, from the train to the funeral car, which soon assumed the appearance of a pyramid of rare and exquisite flowers. The new Palace of Justice, a noble structure situated in a public garden in the most beautiful part of the city of Lausanne, and commanding a ravishing view of the lake and mountains, was the point where the procession was formed and from which it started. I had asked an influential local friend to secure me a press ticket, but he informed me the press would have to look after themselves—that I had better go to the Palais de Justice and join the procession as near as possible to the funeral car. This, therefore, I essayed to do, and fortune seemed to favour my project, for in the Palace among other friends I met Dr. Joos of Schaffhausen, whose acquaintance I had made at the Old Catholic Congress last year, and who is a leading member of the Conseil National, or House of Commons of Switzerland. He said I had better walk with the delegation of that body, but changed his mind when he saw my tall drab hat. Oh that unlucky hat! I thought the mourning band around it would have been a redeeming feature, but it did not prevent it from being conspicuous, so I thanked Dr. Joos and parted from him, determined to fend for myself, and all went well.

It has been my lot to witness many imposing ceremonies in many lands, but for simple dignity and effectiveness I think the burial of this great Swiss citizen and ruler must bear away the palm. To begin with, where in the wide world will you find a scene of such perfect beauty? The blue sky looks down upon the equally blue Lac Leman, and the hot sunshine lights up Alpine peak and glacier, and throws a flood of glory

upon the picturesque spires, towers, and bridges of the old city, all embowered in the rich verdure of trees. The lamps are all lighted and draped with crape. The banners of a hundred societies and associations are also all draped. It is exactly twenty minutes past three when the head of the procession enters the Place St. François. The cannon sounds, and all the bells of the city crash out a funeral peal. The order prescribed is that the troops, sent from Berne on purpose, head the procession. In their midst is a musical society—the Union Instrumentale, who play Chopin's March. Then follows the funeral car with the representatives of the family. After them all the six remaining members of the Federal Council, or the Cabinet or Executive Government of the Swiss Confederation, with Herr Schenk, the President of the Republic, at their head—the Federal Tribunal or Judges of the Supreme Court of Switzerland—the Federal Chambers, represented by more than sixty members of the "Conseil National" and the "Conseil des Etats," the Lords and Commons in fact—the representatives of Switzerland abroad—the ambassadors, the heads of departments. The Council of State of the Canton de Vaud, and then delegations from each of the twenty-two cantons in the Confederation follow.

I could not have described the scene to your readers if I had not been there, and though some of my Lausanne friends pleasantly said they supposed I constituted a twenty-third canton, I believe if Louis Ruchonnet could speak he would gladly welcome among the mourners a representative of the Peace and Arbitration Society he loved so well and had so zealously served. Behind us came at least one-half of the members of the Grand Conseil, or the Parliament of the Pays de Vaud, and the corps of officers, with seven out of the eight colonels who command the Swiss army. A picturesque part of the procession were the many societies with their banners, the students in uniform, and the Freemasons. I am told, but did not see them, that the Salvation Army was represented, as was but fitting at the funeral of their constant protector and champion.

It was a long, hot march, two miles or near it, through the Place St. François and up through the steep narrow streets of the old city. The line of march was roped and well kept by the local fire brigade. Everywhere, upon both sides of us, was tier upon tier of faces at the windows of the tall old houses, while behind the ropes the spectators were densely packed, all standing bare-headed in the hot sunshine. All business was suspended, and as there are thirty-five thousand inhabitants in Lausanne, and some thousands must have come from the neighbourhood and other cantons of Switzerland, probably twenty thousand or twenty-five thousand people took part in some form or other in the ceremony, for the one thing that was patent to me, as we marched up those steep streets, was that all Lausanne, with wife and bairns, was looking on. In the poorer part of the town the men were in blouses and the women in their working dress.

At the great hospital the windows were all occupied with patients, doctors, and nurses. At last we are out of the city and on the high road, which is lined with heavily-laden fruit trees, under which, upon the green sward, the spectators are picturesquely grouped. We enter the cemetery and ascend a long avenue of plane trees. There must have been some hundreds of troops on the ground, who lined the road on both sides with bayonets or sabres at attention. The great mountains, the Dent du Jaman, the Rochers de Naye, and the Dent

du Midi, looked down upon the sad scene, and the westering sun lit up the poplars already touched with gold by the autumn. The grave itself was completely lined with roses and lilies, and laurel and oak, and bay leaves. Alas! the reality and awfulness of death cannot be concealed by this floral drapery!

The setting sun was gilding with glory the mountains

and the western heavens as the choir of the Cantonal Society of Vaudois singers poured forth a last hymn of farewell around the open grave of him who had been first magistrate of the Swiss Republic, and who, all admit, was first in the hearts of his countrymen.

SAMUEL JAMES CAPPER.

II.—SERGÉ JULICH VITTÉ, THE RUSSIAN MINISTER OF FINANCE.

OUTSIDE official circles Sergé Julich Vitté's name was hardly known when the declaration of commercial war with Germany suddenly made

him the most talked of and best abused man in Europe. His daring and decisive action in the struggle of tariffs, which led to such a burnishing of bayonets in Berlin, and brought the international centre of gravity to the Russian Ministry of Finance, is, however, only the last of a long series of surprises in the career of this remarkable man, which raised him, in less than twenty years, from a subordinate post in a provincial railway to the most responsible position in the vast Russian Empire, after the Tsar's. For M. de Giers may weave subtleties of foreign policy; M. Vannovski may mature deep army reforms and economies in buttons; and General Komaroff may meditate invasions of India; but until the Minister of Finance has spoken, their plans and schemes are airy nothings, trifles bodiless as wind.

THE FROSTY CAUCASUS.

But M. Vitté has not always lived in St. Petersburg, on the banks of Nevà, with its marshy breath, grey summer nights, and greyer winter days. He was born—on June 29th, 1849—far away to the south, in the Caucasus, beyond the eternal snow-crests of giant Kazbek and Elbruz. In Tiflis—with its brilliant tepid autumns; its wild March wind-storms, that shriek and howl along the Kura's banks, and fierce tropical heats of June, when the red-hot flanks of the mountains pour showers of fiery

arrows on the withered streets of Oriental houses—was the old classical gymnasium where Sergé Julich Vitté's studies were begun. Thither flocked a motley crowd of

scholars, Armenian, Georgian, and Circassian. Even then, Sergé Julich Vitté showed extraordinary calculating powers, exasperating his family with endless puzzles and conundrums, which he alone could solve correctly. As a youth he was remarkable for personal beauty; with deep grey eyes, brown curls, splendid teeth, and small white hands; tall and well-built, he was a notable figure among the groups of sallow Armenians and dusky dark-eyed Georgians; but in this picturesque medley of Tartars, Jews, Turks, and Infidels, Sergé Julich Vitté was hardly likely to attain elegance and accuracy in his mother-tongue. He is still unique in maintaining that its neuter gender is a mere myth and anomaly, to the great amusement of his Imperial master—before all things a purist in the Russian tongue.

M. Vitté's financial despatches read more like old church Slavonic, or the eleventh century Chronicles of Nestor,

than the liquid speech of the modern Russians. However, a sound knowledge of Greek, Latin, and French, made up in some sort for this linguistic shortcoming; and the study of mathematical problems, from being merely an amusement, became Sergé Julich Vitté's ruling passion. When the gymnasium course was finished, the wild races and wilder scenery of the Caucasus were left

SERGÉ JULICH VITTÉ.
The Russian Minister of Finance.

behind; the mountains and valleys, celebrated in the poems and novels of Lermontoff, the haunts of Petchorin, and the home of Tamara, the beloved of Demon, were exchanged for bright, busy Odessa, Russia's most important harbour on the Euxine Sea.

ANTI-SEMITISM ON £120 A YEAR.

Sergé Julich Vitté entered the University of Odessa in 1866; and four years later, at the age of twenty-one, gained the large gold medal in mathematics, and looked forward eagerly to a Professor's Chair.

When in Odessa, he joined with the witty journalist Asmidoff in founding the *New Russia Telegraph*, whose strong anti-Semite tendencies were in part due to M. Vitté's influence. His family urged him to leave his mathematical studies for a more practical career; and he accordingly accepted the post of Controller or Inspector, from the Society of Navigation and Commerce, to which belonged the South-Western Railway of Russia, with its three centres at Warsaw, Kieff, and Odessa. In this humble post M. Vitté received the magnificent salary of twelve hundred roubles, at the present exchange rate equivalent to £120 a year. However, his unusual ability soon brought him to the front, and he rose by rapid steps to the post of Assistant Superintendent, and then Chief Superintendent of Traffic for the whole system of south-western railways. At this time occurred the terrible Tiligul catastrophe, which involved M. Vitté in a long and tedious Government inquiry, ending in several weeks' arrest in the Hauptwacht of St. Petersburg—a sombre and unhappy introduction to the northern capital of the Tsars.

FRIENDSHIP WITH VISHNEGRADSKI AND PLATON.

From St. Petersburg M. Vitté returned to Kieff as assistant director, and afterwards director-in-chief of the South-Western Railway, then under the presidency of M. Vishnegradski. Next to his own personal force and ability, the steadfast friendship of M. Vishnegradski was the determining factor in Sergé Julich Vitté's success. One can imagine these two future Ministers of Finance, whose friendship dates from those Kieff days, drawing their armchairs together, and over steaming glasses of lemon-scented tea, weaving wreaths of sympathetic converse round the latest theories in spherical trigonometry and quaternions, and mirroring in their harmonious souls each other's thoughts on the higher conic sections. For M. Vishnegradski is also a great mathematician, and was some time teacher to the Tsar, who under his tuition passed a brilliant examination in Technical Engineering. Like M. Pobedonostseff, another imperial pedagogue,

M. Vishnegradski's pupil remembered him in after days. A pretty story is told of Vishnegradski's standard work, on "Differential and Integral Calculus." It appeared first in a lithographed edition, and a Russian lady used the pages to paper the schoolroom of her little daughter in an out-of-the-way Russian village. This little daughter lived up to her wall-paper, and afterwards became

ST. ISAAC'S CATHEDRAL, ST. PETERSBURG.

Mme. Kovalevski, Professor of Mathematics at Stockholm. In Kieff, Sergé Julich Vitté also gained the friendship of Platon, the famous Metropolitan Archbishop of Kieff, the type of strictest Russian 'orthodoxy', and originator of the missionary campaign against the Stundists. It is only fair to Platon to add, however, that he enjoyed in an uncommon degree the friendship and confidence of religious leaders outside the pale of the State Church. On the occasion

of his episcopal jubilee, this friendship was marked by the presentation to Platon of a very ancient manuscript of the Hebrew Scriptures, beautifully bound and set with jewels, a gift from the Chief Rabbis of Southern Russia. This warm friendship between the future Finance Minister and the Metropolitan Archbishop lasted up to Platon's death, and was a proof, if one were needed, of the strong if somewhat narrow orthodoxy of Sergé Julich Vitté's mind.

A SECRET SOCIETY.

It was in Kieff also that M. Vitté became a member of the Okhranà, a secret society founded by the Russian nobility to defend the person of the emperor against the attacks of fanatic revolutionaries. If the history of the Okhranà were written—as it is never likely to be—it would form one of the most remarkable pages in Russian history. It is a notable picture of these two great secret societies; the one drawn from the noblest families in Russia, the other recruited by the desperate sons of liberated serfs, of Cossacks and Jews, standing face to face in the silence; the one determined to destroy, the other equally determined to preserve. M. Vitté's position in the organisation of the southern railways gave him an opportunity to toil terribly in his country's cause during the Russo-Turkish war. His untiring energy, personal influence, and marvellous foresight were felt throughout the whole work of mobilisation, for the arrangement of the whole system of military trains, and the transport of provisions, as well as the sad return of the sick and wounded, devolved chiefly upon him.

A few years after the war M. Vitté devised a scheme of uniform tariffs for all the Russian railways, which was translated into several foreign languages, and accepted

from among many competitors; and this again drew upon him the favourable notice of the Government. M. Vishnegradski, who had already become Minister of Finance at St. Petersburg, used all his efforts to persuade M. Vitté to enter Government service, and devote to his country his rare energies and special knowledge, gained at first hand as he worked his way up from the lowest rung of the ladder. For a long time M. Vitté would not consent. The chill atmosphere, sombre skies, and unnatural, exotic life of the northern capital, so vividly and sadly described by Lermontoff, repelled him; and the memories of his first visit and arrest were not calculated to lessen the impression. At last, however, he yielded to the pressure of M. Vishnegradski, who created for him a new department of railways in the Ministry of Finance at St. Petersburg, whither M. Vitté went in March, 1888, receiving at the same time the *chin* or rank of Actual State Councillor.

THE LADDER OF CHIN.

Like the vision of the Hebrew patriarch, the steps of the ladder of *chin* lead up to the heaven of official favour, far more important than the hall-mark of wisdom and grace in that great bureaucratic world by the banks of Nevà, where the grim dome of St. Isaac's Cathedral frowns down upon the sombre palaces and chilly streets. The grades of this golden ladder, whose top is dark with exceeding brightness, are, beginning from the highest:—

Actual Secret Councillor.

Secret Councillor.

Actual State Councillor.

State Councillor.

Court Councillor.

Titular Councillor.

College Registrar.

District Secretary.

The last four of which have no reference to the functions—if any—actually performed.

GENERAL ROSTYASLAV FADEEF.

prescriptive rights were overlooked in the interests of an intruding youth—a mere outsider. At this time also, again to the astonishment of the Higher Chinovniks, M. Vitté received the Order of St. Stanislaw, almost the highest civil decoration in Russia.

GENERAL ANDREI FADEEF.

PERSONALITY AND POLITICS.

Then came the long illness of M. Vishnegradski, Sergé Julich Vitté's patron and predecessor at the Finance Ministry. At the end of August last year M. Vitté was appointed acting Minister of Finance during Vishnegradski's absence, and once more the Higher Chinovniks raised their grey eyebrows in astonished indignation.

This appointment was confirmed on the 1st (13th) of January this year; M. Vitté became Finance Minister and Secret Councillor, and the top of the golden ladder was practically reached. And so, at forty-four, Sergé Julich Vitté, from the humblest beginning, has risen by sheer personal energy and ability to one of the most responsible positions in Europe. With what vigour and firmness he can fill that position we have already seen in the still fiercely-raging Tariff War, and it is certain that the same qualities in the next few years may be a determining factor in the scale of European politics. Strictly orthodox, as we have seen, and strongly patriotic, M. Vitté believes in the divine mission of Russia and her development from within; and this is the real secret of his antagonism to Germany, as it was of his early anti-Semite leanings.

THE TARIFF WAR.

In many questions of foreign politics the ignorance of the reading public in England is large and comprehensive. This is not because of any lack of interest. It is really because Reuter's staccato telegrams have practically displaced detailed foreign correspondence. It may therefore be advisable to explain what exactly the Tariff War between Russia and Germany means, and what part M. Vitté has taken in it.

In the autumn of 1891, M. Vishnegradski overhauled the Russian Customs Tariff, to see what concessions could be made to foreign Powers who were willing to grant favourable terms of import to Russia's main product—corn. As a result of this overhauling, Vishnegradski decided to lower the Russian import duties on metals and chemicals—Germany's chief exports to Russia; and asked Germany to reciprocate by lowering the German import duty on Russian corn. The Berlin Cabinet promised to consider the matter; but in the meantime introduced the Differential Tariff, which lowered the duty on corn imported from every country except Russia and Roumania; and later the lowered duties were conceded to Roumania, thus leaving Russia out in the cold, as the "most unfavoured nation."

This was naturally unpleasant for Russia; and the unpleasantness was not diminished by the Berlin Cabinet's answer, the fruit of the promised "consideration." The

JULI FEODORITCH VITTÉ.

Actual State Councillor.

Berlin Cabinet said that it might be possible theoretically to grant Russia's request for lowered corn-duties, but that the inducements offered by Russia were quite inadequate. And so the matter went on; Germany continually climbing up, and Russia continually climbing down, till Vishnegradski's illness put M. Vitte in command at the Finance Ministry in St. Petersburg. M. Vitte's great idea — derived from the study of equations and the laws of concussion — was "reciprocity," for which he at once coined a new Russian word. He, in his turn, invented a Differential Tariff, which he proceeded to hold over Germany, and at last put in force this summer. And this system of mutual McKinleyism is the famous Tariff War. Germany certainly began it, and it was nearly two years before M. Vitte "reciprocated."

FAMINE AND PLENTY.

The result of the Tariff War was, that Russia's corn exports to Germany practically ceased, and that Germany's exports of metals and chemicals to Russia shared the same fate. Many Moscow firms which use German chemicals had to close their doors, and two or three leading houses were ruined.

But the really important question for M. Vitte was, what to do with the surplus of Russian corn which would, in the ordinary course of affairs, have disappeared down the throats of the Kaiser's subjects? To do nothing would be to greatly lower the price of corn in Russia, a very disastrous thing for her peasants, especially after the famine of last year. M. Vitte solved the question in a statesmanlike way; first, by buying up vast quantities of corn for the military granaries; and, second, by arranging a system of bank advances to the

peasants, which enabled them to deposit their corn and receive in exchange ready money at a low rate of interest; so that they could afford to hold on, and cheerfully await the issue of the Tariff War, and the consequent righting of the market.

THE OCTOBER CONFERENCE IN BERLIN.

The issue of the Tariff War will depend on the Commercial Conference which began its work in Berlin on the first of October. This Conference is practically M. Vitte's creation, the outcome of his ideas of "reciprocity," and he confidently expects that the issue will be distinctly favourable to Russia; the more so, as since the Army Bill is safely through the Reichstag, German agricultural votes no longer need to be enticed by the practical exclusion of Russian corn.

Strong and determined where his country's interests are at stake, and bringing to bear on political questions the irresistible logic of mathematical processes, M. Vitte has not been rich in that "wisdom for a man's self" that Bacon teaches; the bright lights of his successful career are not without the contrast of dark shadows. Still, the story of his rise, by sheer personal force, from Station-Master to Finance Minister, may form a not unfitting pendant to the lives of other self-raised men like James Garfield.

HEREDITY.

But, unlike the American boy who rose from Log-Cabin to White House, M. Vitte came of a famous family of administrators. His father, Juli Feodoritch Vitte, had been controller of Government estates in the Caucasus, and his uncle, General Rostyaslav Fadeef, who first won fame in the Caucasian War, was one of the greatest military writers in Russia. author of "The Armed Forces of Russia,"

PRINCESS DOLGORUKI (MADAME FADEEF).

MADAME ELENA HAHN.

MADAME BLAVATSKY.

MADAME JELIHOVSKY.

TRANSLATOR OF "THE CAVES AND JUNGLES."

and for some years military adviser to the Egyptian Khedive Ismail. M. Vitté's grandfather, General Andrei Mikailovitch Fadeëf, also famous in the Caucasus, was for some time Governor of Saratoff, where he shared the fame of Sir Walter Raleigh by introducing the potato among the Sectaries and Kalmyks. He planted a garden of the "accursed roots," and proclaimed the most awful penalties for whoever should steal them; the attraction of forbidden fruit proved irresistible, and the formerly rejected tubers were soon spread far and wide through south-eastern Russia. By his marriage, General Andrei Fadeëf became co-heir of the fabulous, intangible fortune of the Dolgorukis, which has been mounting up at compound interest in the Bank of England, tradition says, for more than a century and a half, from a large sum placed there by a Prince Dolgoruki, who was ambassador to the Court of St. James at the beginning of last century. Other famous ancestors of M. Vitté's were Prince Dolgoruki, Major-General under Katherine the Great; another Dolgoruki, who opposed the reforms of Peter the Great; and a long and famous line, stretching back to the Tsars of Moscow, six hundred years ago.

FOUR GENERATIONS OF LITERARY WOMEN.

But a more curious problem in heredity is offered by M. Vitté's collateral relations. His grandmother, the last Princess Dolgoruki, was a famous geologist and botanist, and the friend of Sir Roderick Murchison.

Her daughter was Mme. E. Hahn the novelist, called (by the greatest Russian critic Belinski) the "George Sand" of Russia, the highest praise he then could give. Mme. Hahn's two daughters were the famous Mme. Blavatsky and Mme. Jelihovsky, one of the best known and most popular writers in Russia to-day.

"If you think of saying anything about me," writes Mme. Jelihovsky, "here are the facts. I have written twenty stories for young folks and children, *all* endorsed by the Minister of Public Instruction. Also, one drama and one comedy, both of which got the first prize of the New Russia University. I have written half a score of stories for the people, that are read in all the town halls, with magic-lantern illustrations. Also twelve novels, sixty stories (a fact!—I was astonished myself), and articles innumerable. And, if God grants me life, I am not against writing as many more."

Mme. Jelihovsky's daughter carries on the same literary tradition, and is known to English readers as translator of Mme. Blavatsky's most picturesque and finished work, "The Caves and Jungles of Hindustan." It is remarkable that a family name has hitherto become extinct with each of these famous women. The great geologist was the last of the Dolgorukis; Mme. Hahn's only son died without issue. Mme. Blavatsky had no children, and Mme. Jelihovsky has no son to carry on her name. The same destiny has governed the direct line of the family; M. Vitté and his brothers are childless, and with the present Finance Minister his family name is likely to become extinct.

THE KREMLIN, MOSCOW.

III.—CHARLES GOUNOD.

CHARLES GOUNOD, who has just passed away full of years and full of honours, takes an important place among the musicians of the century. To few composers has it been given to touch so many hearts, or soothe so many heart-aches, as he has done by his religious humanising music, and hence, undoubtedly, has arisen the general sympathy of the public from the hour that his serious condition became known.

I.—CHILDHOOD, EDUCATION, FAILURES.

Born at Paris, June 17th, 1818, Charles François Gounod was the son of an artist, and his mother was an ardent amateur musician. When the child was but five years of age, he lost his father, and the mother, who had another son besides Charles, was compelled to have recourse to teaching music to maintain herself and her children. Foremost among her pupils was her little son Charles, but, notwithstanding the talent he displayed and the rapid progress he made under her careful tuition, she did not intend him to adopt music as a profession. He was to be a notary, and music was to be merely a relaxation. But the lad showed such distaste for the profession which his mother had chosen for him that she finally yielded to his wishes.

MARIE MALIBRAN.

Marie Anne de Bovet * relates that while yet a school-boy, Gounod once heard Rossini's "Otello" sung by Rubini and Marie Malibran. Shut up in his school he dreamt henceforth only of Marie Malibran, to whom he owed these haunting memories. He became jealous of the composers whose music she sang, and an engrossing thought took possession of his mind: "If the time should only come when I can write an opera for *her*." In vain did he hasten that blissful moment, for death forestalled him; but if Marie Malibran never breathed Gounod's melodies, Fortune took pity on his despair, and it was her sister, Madame Pauline Viardot, who a little later opened the door of fame to the obscure beginner.

Gounod's first professional training was under Antoine Reicha. In 1836, when he was about eighteen, he entered the Paris Conservatoire, remaining there for two years, and receiving instruction from Halévy in counterpoint, and from Lesueur in composition, while he went through a regular university course at the Collège St. Louis, graduating LL.B., with distinction. The first time he entered the lists in the competition for the Prix de Rome, he came out second, but in the same year (1837) his first composition—a scherzo on the theme of Marie Stuart and Rizzio—was performed in public.

GOUNOD'S MASTER.

When he was not quite fourteen, he heard "Don Giovanni" for the first time, and he very soon knew it all by heart. A year or two ago he even wrote a book on the "incomparable and immortal *chef d'œuvre*," that others might learn to appreciate it as much as he did. According to Gounod, Mozart was one of those men who seem destined, in their sphere, to reach a point which admits of no farther advance. In another characteristic way he pays the master the profoundest homage:—

When I was very young, I spoke always of myself alone. I condescended after a few years to add Mozart, and to say, "I and Mozart." It so happened, however, that after studying a little more, I thought I had better say, "Mozart and I." Now what I say is, "Mozart."

* "Charles Gounod: His Life and His Works," by Marie Anne de Bovet. (Sampson Low.)

IN THE ETERNAL CITY.

It was not till 1839 that Gounod secured the Prix de Rome, enabling him to continue his studies in Italy. At this time his mind was also much occupied with religious problems, and the compositions of this period were chiefly of a sacred character. Early last year, the *Century Magazine* published Gounod's impressions of his sojourn in Italy.

I must confess (he wrote) that Rome did not at first correspond to the dreams my fancy had conceived. It struck me as cold, dry, cheerless, and gloomy . . . The first impression of austerity threw me into a profound melancholy . . . However, little by little, every day contributed its sedative effect, and some six weeks elapsed before my sadness took its flight. Its very silence now began to charm me, and I found peculiar pleasure in visiting the Forum and all those other remains of greatness and power now gone, over which has been extended for ages the august and peaceful crook of the Shepherd of Nations.

"ABBÉ GOUNOD."

In 1843 we find Gounod back in Paris making the rounds of the publishers, but his works were oze and all politely declined. One day, when he was unusually weary of the world, he strayed into a chapel in which two hundred priests were kneeling and chanting litanies, etc., to the Virgin. Gounod knelt among the worshippers and asked of one of them what church this was:—

It is the Chapel of the Seminary of Foreign Missions.

This was the ideal place of refuge from the harsh world without, he thought, and at the end of the ceremonies he timidly addressed a priest who was kneeling in one of the choir stalls: "Mon pere, what shall I do to remain always in this house?"

And five years Gounod studied in this holy house, filling also the posts of organist and leading tenor. He had even come to be spoken of as the "Abbé Gounod," when one day the world learnt that "Sapho," a lyrical drama, was to be presented at the Grand Opera under Madame Pauline Viardot, and that Gounod was the composer. Gradually he returned to the world, but he always kept his love for the Church. The music of the altar was his domain, and though he has had two great successes in the theatre, in his old age he returned to his first love—mysticism and sacred music.

No composer ever failed oftener or was less discouraged by his repeated failures. "Sapho" was not a success; the music to Ponsard's "Ulysses" was a fiasco; and "La Nonne Sanglante" (The Bleeding Nun) was a failure. A setting of "Le Médecin Malgré Lui" did not fare much better, but it found its way to London under the title of "The Mock Doctor." Meanwhile Gounod had married the daughter of M. Zimmermann, a professor of music, and "Faust" was waiting for a hearing. Before looking further at his works, let us repair for a brief while to the luxuriant home that Gounod established for himself in the French capital.

II.—GOUNOD AT HOME.

The Paris home of M. Gounod is situated in the Place Malesherbes, in the Quartier Monceau. The splendid house in French Renaissance style was built some twelve years ago, by M. Jean Pigny, his brother-in-law, on a site at the angle of the Rue Mont Chanin, and opposite the statue of Alexandre Dumas père, the last work of Gustave Doré. A writer in the *World* has put on record a description of this famous palace:—

The gates of wrought iron at the foot of the broad staircase are no sooner past than you are lost in admiration at the beauty

of everything which meets your eye. M. Pigny adroitly reserved his effect of subdued light for the musical *sanctum sanctorum*, but no hue could possibly be too bright for the decoration of the approaches to it.

The most famous looms in Smyrna were occupied for an entire twelvemonth in producing the thick carpet on which you tread; frescoed figures of the Muses, with appropriate inscriptions, stand out boldly from a background of cerulean blue; every available corner is occupied by a conservatory filled with tropical plants; and the low pealing of a distant organ would greet your ear as you halted before a Gothic screen of delicate metal work, and touched with feelings of awe and tropidation a mediæval bell-pull of exquisite proportions.

The servant, of ecclesiastical mien, who opened the glazed door, spoke with bated breath, and in accordance with his request you followed him along a long corridor till you came unexpectedly to a huge mirror which entirely concealed the entrance to his master's closely-guarded *atelier*. A spring is touched, the great sheet of glass rolls slowly back, and you find yourself at the head of a short flight of steps leading down to a vast apartment illuminated only by narrow stained glass windows and a solitary reading-lamp, which sheds its rays dimly over a writing table and the costly Persian prayer-carpet spread upon the parquet floor.

THE SANCTUM.

The same writer continues:—

As your eye became gradually accustomed to the prevailing gloom you would perceive a man, seated, with his back to the door, before a large organ, the topmost pipes of which almost touch the oaken beams of the open roof. A skull-cap of black velvet partly concealed his long gray hair, and his hands continued to glide gently over the keys, till his servant whispered in his ear that a visitor had dared to invade the privacy of his ideal music-room, which reminds you of both an Eastern mosque and a Western shrine.

As Charles Gounod came forward to bid you welcome with accents almost as soft and caressing as his own melody, you saw that his beard was both longer and whiter than it was when he tarried for a while among us after the Franco-German War. In the button-hole of his loose velvet coat he wore the crimson rosette of the Legion of Honour.

Your eye roaming about the room would take note of Francesco's medallion of Christ in front of the organ, Jean Gounod's copy of Titian's "Holy Family," the curious pianotable planned by M. Pleyel for the composer's special use, and Ghiberti's bas-relief, from the Florentine Baptistery, in the centre of the sculptured over-mantel of black oak.

The dog-inkstand, Herbert's reproduction of a fragment of Michael Angelo's "Last Judgment," the costly Japanese vases, the medallion of Jeanne d'Arc, and portraits of Lorenzo and Giuliano di Medici have all a history; and the author of "Faust" is not a little proud of the cases with folding covers he has contrived for the accommodation of his papers, and the padlocked receptacles in which he guards the MS. score of all his great works.

The head of Isaiah from the Sistine Chapel was a New Year's gift from his artist son; and your host would expatiate on the merits of the copy of the picture of the death and resurrection of St. Zenobia, his favourite painting in the Duomo at Florence, while he would fill a well-blackened pipe with the strongest *caporal* to smoke during the half-hour he consented to chat with you.

An electrical signal caused the *concierge* to put the hydraulic blowing apparatus of the great organ in motion, and the master would play some such piece as his "Ave Maria" for your edification.

Gounod's residence is on the second floor. His sister-in-law lives on the first, and overhead dwells his son, while the ground floor is occupied by Gounod's daughter, married to Baron Pierre de Lassus. In the summer the whole family flits to the Villa Zimmermann at St. Cloud, a country house which Madame Gounod inherited from

her father; and November finds the family established again under the patriarchal roof.

ON TOBACCO-SMOKING.

Like most great men, Charles Gounod had his amiable weaknesses. His briarwood pipe was one of them; and although he wore a ring, modelled from a relic found in the Roman catacombs, on his finger, he frankly confessed that he received finest inspirations while playing "patience" at the little card table placed in the shadow of the organ.

He loved his pipe dearly. In this connection the following words of his have an interesting bearing on tobacco-smoking and its effects:—

I admit sincerely the truth of Tolstoi's opinion in all that has to do with the intellectual faculties. I think that the habit of using tobacco produces a sluggishness of these faculties, that this sluggishness follows upon the habit, and by abuse may reach even to atrophy. I am not so sure that it could positively result in the annihilation of Conscience, whose witness is too startling to undergo so easily an eclipse so disastrous. I say Conscience, be it noted; I do not say Will. Conscience is a Divine decree; Will is a human energy. The latter can be weakened by abuse of the organs; the former, however, seems to me quite beyond all effect of the sort, because it creates the responsibility without which man ceases to be amenable. I have smoked a great deal. I do not recall that it has ever modified the judgment of my conscience on the morality of my acts.

Gounod's punctuality and exactitude were proverbial. If anything happened to prevent his keeping an appointment, he always wrote so that you should not make your call for nothing. He attended to his own correspondence. "Too many persons talk to me of their private affairs for me to let a third person know about them."

III.—LYRICAL DRAMA.

Gounod's reputation as a composer rests mainly on the operas of "Faust" and "Roméo et Juliette"; on his two oratorios, "The Redemption" and "Mors et Vita"; and last but not least on his "Ave Maria."

FAUST AND MARGUERITE.

Sixteen musical versions of "Faust" have been given to the world—settings by Prince Radziwill, Spohr, Schumann, Liszt, Wagner, Berlioz, Boito, and other less well-known composers. Gounod's marvellous interpretation of Goethe's masterpiece was first produced on March 19, 1859, and was fiercely criticised. Can those critics now realise that it is the opera of all others that never fails to fill a house? M. Choudens purchased the publishing rights for £400 (making, it is said, £120,000 out of it in thirty years), and Messrs. Chappell, it is understood, secured the English publishing rights for £40, thinking so little of their bargain, however, that they omitted to register the performing copyright. Mr. Mapleson was afterwards paid £400 to produce it, and "Faust," after successes in England, made its way back to Paris to continue its triumphant career.

An opera that has been heard thousands of times and that never fails to charm and draw full houses has naturally produced a number of Marguerites to personify Goethe's heroine. The creator of the part was Madame Carvalho, wife of the manager of the theatre. What her business was, is set forth by Gounod somewhat as follows:—

If the singer does not infuse some of her personal feeling into her song, neither the natural qualities of her voice nor her

acquired technical knowledge will enable her to thrill her hearers. . . . The work which the author has created by his heart and his imagination is, so to speak, created afresh by another's heart and imagination—intelligent reflexes of his own—by which it is conveyed to the public.

Gounod owed much to three women in this respect—Madame Pauline Viardot, Madame Carvalho, and Madame Gabrielle Krauss. A critic in 1836 described Madame Carvalho's voice as "A thin, shrill soprano, as slender as her person, cut in two by three or four pasty notes, a regular bird-pipe"; but, adds Marie Anne de Bovet, she is the most striking example of the extent to which intelligent perseverance can conquer natural defects. She became a perfect *prima donna*, she created Marguerite, and held the stage with triumph for more than thirty years.

ROMÉO ET JULIETTE.

"*La Reine de Saba*" succeeded "*Faust*" in 1862, and Gounod, it is said, was greatly disconcerted at the failure of this particular work. Nevertheless, it turned out a success at Brussels and Darmstadt. In 1864 "*Mireille*," founded on Mistral's Provençal idyll, was received with favour, and in April, 1867, "*Roméo et Juliette*" followed. It is noteworthy that the best settings of Shakespeare have been written by foreigners—"Otello" and "*Falstaff*" by Verdi, and "*Roméo et Juliette*" by Gounod. Similarly the greatest musical version of "*Faust*" has proceeded from the pen of the Frenchman. "*Roméo et Juliette*" has become quite a favourite at Covent Garden.

services, and on one occasion averred that the service at St. Paul's Cathedral was "the finest musical treat in Europe!"

"THE WORK OF MY LIFE."

To escape the siege of Paris, Gounod took refuge in England, and during his absence "*Les Deux Reines*" and "*Jeanne d'Arc*" were produced at Paris. Three other works followed, all of them adding little to his reputation apparently. It will therefore be a relief to hasten on to the Birmingham Festival of 1882, which was marked by some eminently satisfactory features. Of the new works which it called into existence, "*The Redemption*" occupied the largest share of public attention. Described and discussed beforehand, presented with every possible advantage, and executed by the first artists of the day, under the composer's personal direction, it is small wonder that the work was hailed with enthusiasm.

Gounod was his own librettist. The oratorio is a lyrical setting of the three great facts on which depend the existence of the Christian Church—the Passion and Death of the Saviour; His glorious life on earth from His Resurrection to His Ascension; and the spread of Christianity in the world through the mission of the Apostles. These three parts are preceded by a prologue narrating briefly the Creation, the Fall, and the Promise of Redemption.

The first noticeable feature in the music is a *leit-motif* to typify the character of the Redeemer. This exquisite

In June, 1889, it was first given there in French, with M. Jean de Reszke and Madame Melba in the title-roles, and the French version continues to find acceptance. An English version was prepared for the Carl Rosa Opera Company in 1890. "*Philemon et Baucis*" has also been heard several times at Covent Garden.

IV.—THE MUSIC OF THE ALTAR.

All Gounod's works, the operas included, are deeply imbued with religious feeling, and it is as much as a composer of sacred music as the composer of "*Faust*" that the French master has made his mark, especially in England. A correspondent of the *Musical Standard* says that Gounod, when in London, was a frequent attendee at the Church of St. Andrew in Wells Street. Sir Joseph Barnby was then organist and choir-master, and he had introduced a great number of the French composer's works. Gounod was, in fact, much attached to the English Church

theme, which asserts itself first in the Prologue, constantly recurs throughout the work when the mission of the Saviour is dwelt upon. In the "*Mass in Honour of Jeanne d'Arc*"—not the play alluded to above—Gounod has again made use of the *leit-motif*, the "leading motive" of Jeanne d'Arc herself; and in "*Mors et Vita*" there are several such melodic forms.

It is stated that, after the refusal of the work in its shorter form in 1873 by the committee of the Birmingham Festival, "*The Redemption*" was submitted to the Albert Hall authorities by the composer, who was then conductor of the choir; but the proposal ultimately fell through. Much of the music of the Pentecost scene was written as far back as 1867, when Gounod was on a visit to Rome. He has pathetically referred to the oratorio as "the work of my life," and on standing up to conduct it for the first time at the Midland capital, he has recorded that his feelings nearly overcame him. Our slavish following of the score he attributed to British pride:—

Your artistic taste must be superior to the taste of other

nations, just as your navy is more powerful, and your cotton and flannel of better quality.

DEATH AND LIFE.

"Mors et Vita" is more melodious than "The Redemption," yet it has not taken quite such a firm hold in this country. No doubt this is partly due to the text being in the Latin tongue, whereas "The Redemption" is in English. "Mors et Vita" forms the sequel or continuation of "The Redemption," and among the essential features which the composer has here sought to express are the tears which death causes us to shed here below; the hope of a better life; the solemn dread of unerring Justice; and the tender and filial trust in eternal Love.

The subjoined melody expresses the terror inspired by the sense of the inflexibility of justice and by the anguish of punishment:—

The second melodic form of sorrow and tears is transformed by the use of the major key into the expression of consolation and joy:—

The happiness of the blessed is the third leading motive:—

Lastly comes a melodic form to announce the awakening of the dead at the terrifying call of the angelic trumpets:—

On the news of Gounod's death reaching Balmoral, the Queen, who was not a little partial to the Frenchman, forwarded, through Lord Dufferin, the following telegram to Madame Gounod:—

The news has just reached me of M. Gounod's death. Pray convey to Madame Gounod and her family my sympathy and deep regret. It is an irreparable loss. I entertain the greatest admiration for the works of that great master.

(Signed) VICTORIA R. ET I.

"The Redemption" is dedicated to Her Majesty; "Mors et Vita" is dedicated to the Pope, but the Queen attended a performance of it at the Albert Hall when it was introduced in London.

AVE MARIA.

In concertos and works in that line dealing with classic forms, Gounod seems almost an anomaly; but he has written one little gem which has never been surpassed in popularity. The idea of two great composers combining was novel and ingenious, and Gounod's "Meditation on Bach's First Prelude," better known as "Ave Maria," has been sung and played everywhere in all conceivable shapes, and with every conceivable combination of instruments. It was first performed at St. Martin's Hall in 1851. More recently, a pendant to this famous piece was written on Bach's Second Prelude, and was

brought forward as an interesting novelty at a Promenade Concert, but its popularity is not likely to be as abiding as the first.

V.—LIFE'S CLOSE.

To follow Gounod's career by noticing all his works is impossible here; equally hopeless is it to add a mere list of them. The great oratorios and a very large number of other works are issued by Messrs. Novello, Ewer and Co.; "Faust" is published by Messrs. Chappell, and many songs by Messrs. Boosey; Messrs. Augener, Messrs. Schott, and other firms issue many others. The songs are legion, many of them being set to English words—e.g., "There is a Green Hill Far Away," "Ring Out, Wild Bells," etc. Gounod's last English song, "When the Children Pray," has just been published by Messrs. Phillips and Page, who have brought out most of his more recent works, notably "The Peace of God," "Evening Lullaby," etc.

GOUNOD ON BLINDNESS.

Our composer was happily neither deaf nor blind; but it is almost incredible that a musician should prefer deafness to being blind. Rubinstein is reported to take the same view of the two calamities.

To see (says Gounod) is to enjoy. Future life will be nothing more than universal vision.

If I had to choose (he says again) one of these two terrible calamities, deafness or blindness, I do not think that I should hesitate an instant. The deaf are generally said to be less cheerful than the blind; but notwithstanding the fact that loss of hearing would affect me in regard to that which has always been the source of my very keenest and deepest feelings—I mean music—yet, between being deaf and never again seeing anything one loves, there is, in my opinion, so vast a gulf as to make that one consideration sufficient to decide the question.

One must not forget that a musician can enjoy music to a great degree by merely reading it; and though the actual sensation of the sounds is necessary to make the impression absolutely complete, yet it is sufficiently strong to convey melody, harmony, rhythm, quality, and all the other elements of music—in a word, to give a real mental hearing of the piece so as to stamp it on the mind without the aid of the external sounds.

But blindness! the privations it implies; the sacrifices it imposes; the virtual imprisonment of not being able to walk alone; the dismal darkness of never beholding the face of nature; the silence and solitude of being unable to read and write! As long as he can read a book, a deaf man remains in close communication with the whole circle of human thought. The blind man, on the other hand, is dependent on others for all he wants; he is the prisoner of prisoners. A thousand times rather, then, be deaf than blind.

PREMONITIONS.

A more striking contrast to the tragic circumstances of the death of the master, for whom Gounod's admiration was boundless, than was shown by the universal sorrow expressed at the death of the French composer, it would be difficult to imagine. Mozart was buried among the nameless poor, with no friend to shed a tear, and no cross or stone to mark the exact site of his resting-place. Gounod's remains have been accorded the highest honours which his country can bestow.

The allusions of the two composers to approaching death were remarkable. Only a fortnight before Gounod died, a representative of the *Revue de Famille* paid him a visit and asked him to write the article on "Marie Antoinette as a Musician" for M. Jules Simon's magazine. In the course of conversation he said to his interviewer:—

I have never been able to do any work that my soul did not thoroughly feel. This article does not come home to me; and

then, mark you, I am strictly enjoined to abstain from any kind of work. You must know that some time ago I had an attack of paralysis. Now, when I look at you in this way I can only see one half of your face. I know I look robust; but, as St. Paul says in his Epistle to Timothy: "I am now ready to be offered, and the time of my departure is at hand. I have fought a good fight: I have finished my course; I have kept the faith." I have had several attacks already. The next!—

He repeated in Latin, with emphatic reverence, the words he had quoted in French, then relighted his pipe and went on talking dreamily, but his mind was evidently turned to the great problem he was so soon to solve. Referring to music and its spiritualising effects on the soul, he continued:—

Music gives a foretaste of the immateriality of the future life.

As the journalist was taking his leave Gounod asked him if he was married. The reply coming in the affirmative, Gounod took out his pruning knife and cut a number of roses, adding, "Give her these flowers as a souvenir of your first visit to an old man."

Referring at another time to the life beyond, he said:—

All will be explained; light will dawn on all things, and you will find that the unknown is not so appalling. I am certain of it.

M. GOUNOD'S HOUSE AT ST. CLOUD.

MOZART'S DEATH-HYMN.

There is another strange point of resemblance in the life's close of the two composers. When the hour of death approached, each was absorbed in his own funeral-hymn. Mozart was sick of a fever, and in the lucid moments which came to him, he, in full view of another world, worked eagerly at his immortal Requiem. He felt that the unknown messenger from a nameless friend

who had given him the commission for the work fore-shadowed his own doom.

My mind is struck, and I cannot dispel the image of that unknown man. . . . He presses me, pursues me without ceasing, and urges me to composition in spite of myself. When I stop, the repose fatigues and harasses me more than the work. . . . I feel that my hour is about to strike. . . . I

must finish my funeral-hymn.

These were the last words Mozart wrote with his own hand, and alas! he died with the unfinished score beside him.

REQUIESCAT IN PACE.

On Sunday afternoon (October 15), Gounod asked M. Busser, the organist of the church at St. Cloud, to call to see him, for his Requiem was to be played at the Conservatoire during the winter, and he wished the organist to make a piano score of it. Gounod, having honoured his friend by the invitation to prepare the score, took his seat at the piano, and played and sang with his usual verve, much to the delight of his family. In the evening he returned to the Requiem, and put the score in the secrétaire, and then fell forward in a state of unconsciousness from which he never recovered. He had been singing his own hymn of death, as Mozart in

his last hour had joined the friends at his bedside in singing the completed parts of his work, stopping short, however, at the "Lacrymosa" to weep and to close his eyes for ever. Gounod's happiness would indeed have been supreme could he have been conscious for one brief moment of the fact that his end bore such close resemblance to that of "the most brilliant star that has ever shone in the musical firmament."

LEADING ARTICLES IN THE REVIEWS.

IS IRELAND PAST SAVING?

A BLACK PICTURE BY ONE WHO KNOWS HER WELL.

AMONG all the dismal descriptions, which the wildest partisan hatred or despair ever inspired, of the present condition of Ireland, there is probably none to equal the sketch which a Home Ruler, who signs himself X., contributes to the *Fortnightly Review*. The article is the first of a series which is to deal with "the Ireland of To-day." The writer's pessimism regards the economical and social situation rather than the political.

The eye dims with tears at the unhappy spectacle—thousands of good acres going annually out of cultivation; an incessant stream of the young and the able-bodied headed for Queens-town or Galway to take ship; whole country-sides dotted with roofless cottages; once populous towns shrunk into squalid shelters for the crippled, diseased, vicious, and incompetent residuum which remain; a deserted people, conscious of being a bedraggled and tattered shadow of their former selves, loafing or pottering about among their ruins with a shamefaced bravado, wearing shoddy English clothes, reading the lowest and flashiest English trash, singing the London music-hall songs of last year, trying in a hundred pitiful ways to make themselves believe that they are really a nation, a co-partner in the greatest of modern empires—one cannot but be moved at the sight. Many causes have of course contributed to produce this lamentable result. Long observation and experience convince me that the chief agent in working the mischief, as well as the most difficult obstacle in the way of remedying it, has been and is the Irish railway system.

"THE REAL RULERS OF THE ISLAND."

Our common belief is that Ireland is governed by Parliament at Westminster. . . That is a government which counts for very little. The true control of Ireland as a whole is vested in a Parliament which no one hears of, whose monthly sessions nobody reports; I mean the "Conference" of representatives of the Irish railway and steamship lines. These are the real rulers of the island.

The traffic is managed without regard to public needs or convenience. The local goods rates are so exorbitant as to have stamped out several once flourishing industries and to have crippled those that remain.

IS NOT THE REMEDY TOO LATE?

"Almost as grievous an indictment might be brought against the Irish banking system." Instead of promoting the internal development, "the Irish banks in practice exist for the purpose of getting together Irish money to send it away for investment elsewhere." Ten out of twelve millions sterling of the Bank of Ireland's capital are in the use of the Government outside of Ireland.

No man can get money from an Irish bank for Irish industrial or commercial purposes unless he can prove that he does not need it. To grant a loan on prospective profits, to lend upon mercantile security is unheard of.

But will not Home Rule miraculously regenerate the land?

I speak as one who is willing to see the experiment tried, and who fain would believe that these baleful results may follow. But above every form of hope there rises the grim and gloomy shadow of doubt—is it not really too late?

The "so-called problem of Ulster" is dismissed with ridicule. Irish Nationalists and Irish Unionists laugh among themselves at the serious regard paid by the Saxon to their violent "histrionism." Both are privately pre-

paring to work together in the expected Irish Parliament. The true basis for fear lies in the condition and character of the people as a whole. "No statesman has ever before been confronted with a task of such dimensions." As in no other land, the aristocracy have abandoned all concern for the people. Professional men are to commercial men in "the ruinous ratio" of twenty-one to eight. The agricultural class is a shade better off, thanks to recent legislation. But the villages are manifestly decaying.

THE DOMINANCE OF THE PUBLICAN.

From one-fifth to one-third or a half of the male population of a community large enough to have a tied house, "is body and soul at the service of the publican." It is a rare village which the publican cannot control. Emigration has steadily increased "the proportion of idle, incompetent, and valueless males left in Ireland." This "rapscallion class," as "X." calls it, supplied the criminals of the Phoenix Park murder type, but were generally kept successfully in the background, until "Mr. Parnell's collision with destiny and the British matron." Parnell saw in this ragamuffin element under publican control large possibilities of support, and straightway flung himself into the arms of the Dublin publicans. The line of cleavage so made runs through almost every village in Ireland. The publican is on the Parnellite, the priest on the other side. Where the priest is in antagonism with the publican, the priest's influence may be written down at zero.

THE PROBLEM OF IRELAND.

No partisan politics are involved in Parnellism; it is a social and ethical affair. These pot-house loafers and corner-boys spread a murrain of vagrancy and drunkenness through the youth of the country.

It is this wholesale dry-rotting of the boys growing up in the Irish towns and villages, merely through contact with this ever-swelling army of loafers and vagabonds, which makes one ask with a sinking heart what hope there is of the new generation.

"The Irishman returned from America or Australia is one of the worst elements" in this set. Even in the middle class there is no real social life nor efficient house-keeping. "The journalism of Ireland at its best is bad." Literature "has practically perished out of the land"; "the dear old music" has gone. "Poor, dishevelled and dirty Dublin does indeed strive to cling, in a feeble desultory way, to the shadow of her former literary fame."

Briefly, then, the problem of Ireland is this: By what miracle can this remnant of the home race, now so thinned-out and woefully deteriorated in stock, so overlaid in its centres of population by an infected human scum, so committed at every turn to the grossest fallacies and abuses of industrial, commercial, and political organisation, and so cruelly distanced and demoralised in all the things which elsewhere go to constitute a healthful and well-balanced national life—win regeneration?

FROM Messrs. J. & A. Manson and Son, of Rothesay, who make a spécialité of their series of yacht photographs, I have received a fine photo-mezzotype reproduction of a very successful picture of the *Valkyrie*, which they publish at a shilling a copy.

"TO YOUR TENTS, O ISRAEL!"**A FABIAN CRY OF REVOLT.**

THE Fabian Society contributes a manifesto to the *Fortnightly* this month, headed "To your Tents, O Israel!" It is one long and cleverly varied ejaculation of disgust with the present Government for having done so little to bring in the Socialist millennium. The apparent conversion of the Liberal Party to Collectivist politics is dated from the starting of the *Star*, and is said to have reached its height in the adoption of the Newcastle programme as expounded at the last General Election. It is claimed for that programme that without it Mr. Gladstone would have had no majority on English questions. But now "the opportunities of the Liberal Cabinet have gone beyond recall."

THE GOVERNMENT NOT "A FAIR HOUSE."

The Government has not made itself the model employer that Mr. Campbell-Bannermann promised it should become. The Government is not "a fair house." It does not uniformly insist in its contracts on trades-union rates. It has not enforced, under its various departments, the London County Council 24s. a week minimum of living wage. The plea of obstruction does not here hold good:—

A few strokes of the pen from the heads of the departments, with due provision in the Budget, which must be brought in, obstruction or no obstruction, time or no time, and the thing is done. If, after sixteen months, it has not been done, the Liberal Ministers have broken their pledges to the trade-unionists.

One after another, Ministers are brought to book and condemned. Mr. Fowler, for example, "might" by a series of stirring circulars and inspectors' instructions, have set on foot a wide-spread system of old-age pensions; he might have revolutionised every workhouse and casual ward in the country; he might have lectured all the local authorities in the kingdom on the advantages of adopting the labour policy of the London County Council, and might have helped the Guardians to "set" the unemployed on work. But Sir William Harcourt is the head and chief of the offenders.

A SOCIALIST ASSORTMENT OF THE CABINET.

The Fabian reading of the situation in the Cabinet runs in short thus:—

When the secret history of Mr. Gladstone's administration comes to be written, it will be found that since the very formation of the Cabinet, the Progressive party, led by Mr. Asquith and Mr. Acland, and joined by Lord Rosebery, Lord Ripon, Mr. Mundella, and Mr. Bryce, has been hampered, mocked, and eventually overborne, firstly, by Mr. Gladstone's complete absorption in Home Rule; secondly, by the active hostility of such seasoned Whigs as Sir William Harcourt and Mr. Fowler; thirdly, by the doctrinaire Manchesterism and pettish temper of Mr. John Morley; and fourthly, by the ignorance, indifference, and inertia of the Whig peers, Lords Spencer and Kimberley, backed by such obsolescent politicians as Mr. Shaw-Lefevre and Mr. Arnold Morley.

And the lesson of all this disappointment and disillusion is the duty of forming and extending an Independent Labour Party. Pending its arrival—

The working classes need not greatly care which party divides the loaves and fishes, provided only the Government has a sufficiently narrow majority to make it highly sensitive to pressure from without.

WHAT IS TO BE DONE NEXT?

The next step insisted on is that the trades unions provide "a parliamentary fund of at least £30,000, and run fifty independent Labour candidates at the next general election." The money difficulty does not exist

for bodies like trades unions, which can raise a thousand pounds by a levy of from a penny to sixpence a member. "The representation of the working classes at the general election will depend on the great national trades unions, and not on the Socialist bodies." The Fabian Society intends to circulate this manifesto "throughout the length and breadth of the labour world." It is an indictment of the Government that will certainly "tell" among working men of a socialistic trend.

WHAT THE MINERS FOUGHT FOR.

In a paper entitled "The Miners' Battle—and After," Mr. Sydney Olivier undertakes to explain to readers of the *Contemporary Review* the real purport of the coal struggle. The miners have been fighting for "the basic principle of a minimum wage: of a decent standard of living" as the first charge on production. They know—the coal industry of Great Britain could be so ordered by rational organisation and economy as to yield both owner's profits and worker's living wage continuously, and this without such prices to consumers as would hurt either our home or export trade.

"They have it in mind to bring about such an organisation" by legal limitation of hours and transfer of all proprietary interests in royalties, etc., to the State:—

In a word, the Midland and Western miners are of the economic and political school of industrial democracy; and their battle has been not merely a vast "higgling of the market," but an engagement in the Collectivist campaign, a demonstration of the vigour in England of that Socialist movement, one chief aim of which is to supersede the relations out of which such battles arise.

WHY THE MEN REFUSED ARBITRATION.

It was asked, why not go to arbitration? There seems much virtue to many in that "blessed word" arbitration. But what was the question to be arbitrated on? The masters' contention that current prices required a reduction? With contracts for gas-coal accepted at 5s. 3d. a ton there would be little doubt as to the answer. The men's position was that such prices should never have been touched. Arbitrate on that? Conceive the comments of the *Economist* or the *Times* on such a suggestion. Unquestionably the men would have lost, upon grounds they judged irrelevant to the issue, in any arbitration conducted on the lines on which arbitrators usually proceed.

THE "ECONOMIC" ARGUMENT—WAGES AND PRICES.

Mr. Olivier next calls attention to the strange conception which in the name of political economy makes wages dependent on prices, and exactly reverses the teaching of Mrs. Fawcett and John Stuart Mill, that "the basis of exchange value was cost of production, and that the first element in cost of production was a wage determined by the standard of life of the worker:" and that then came interest, profit, last of all rent. "If the coal-owners combined to keep prices at a reasonable level . . . they could . . . keep their businesses going and their workers properly paid." The sliding scale "leaves wages directly at the mercy of prices," and at present by reckless under-selling owners know how to affect prices. The argument of the owners that they cannot help themselves, but must, under pressure of competition, screw down their men is Marx's argument: and "if the masters appeal to Socialist premises, the men will not be slow to follow with the Socialist conclusion." If capitalists can not organise industry to better purpose, the workers through the State must do it for them. The organisation must be built up by trades unionism, legislation, and between the two Collectivism, local and national. Boards of conciliation will almost certainly be formed, but can ensure no permanent settlement.

HOW TO "MEND" THE HOUSE OF LORDS.

A CONSERVATIVE SCHEME.

THERE is something very suggestive about the fact that the moment when, according to its friends, the Upper House has won for itself an unusually high place in the national favour, is chosen by them to propound schemes for its general reconstruction. The *Edinburgh Review* holds up to ridicule "the light-headed band of Radicals who call out that the House of Peers must be mended or ended," but for all that devotes one-eighth of its space to an elaborate endorsement of their first alternative. Its sympathetic review of Mr. W. C. Macpherson's "The Baronage and the Senate" is written with the twofold purpose of defending and of mending the House of Lords. It sees in the rejection of the Home Rule Bill a vindication of the constitutional and co-ordinate authority of the three branches of the Legislature. It applauds the author—who, by the bye, writes from the comparatively detached standpoint of a resident in Australia—when he magnifies the difficulties which would attend any attempt to abolish the Second Chamber. The monarch would never, unless animated by ulterior absolutist aims, consent to its abolition; and the wholesale creation of new peers requisite to the passing of the abolitionary Bill would be equivalent to a revolution.

THE LORDS AND THE EMPIRE.

"The bicameral system has been approved by the unanimous voice of mankind." The House of Commons, more than ever likely to be swayed by gusts of popular passion, needs a Chamber of Revision. The change from democracy to an empire in France, and to Mr. Gladstone's dictatorship in England, shows that the safeguard of a Second Chamber cannot wisely be dispensed with. The reviewer goes on to quote with approval Mr. Macpherson's dictum—"Either the single Chamber would destroy the Monarchy, or the Monarchy would destroy the single Chamber." A more important argument is that the House of Lords, which "contains many members of Indian, Colonial, and other imperial experience," represents the Empire as the House of Commons does not. "The quarrel of the Colonies," says Mr. Macpherson, "has been with the Colonial Office—that is to say, with the House of Commons." It is to the Upper, not the Lower, House that "the Colonies will look for sympathy and consideration." "The House of Commons can be more in earnest," urges the reviewer, "about the workman's glass of beer or the vaccination of his infant, than over the Indian frontier or the occupation of Egypt." This is a strong point; until we have some sort of Council directly representative of the Empire, it is perhaps the strongest point in the case for the House of Lords.

REPRESENTATIVE CHARACTER OF THE LORDS.

Both Mr. Macpherson and his reviewer labour to prove the unrecognised extent to which the Upper House is a representative body. Lords and ex-lords of appeal, Irish and Scotch representative peers, are not "hereditary legislators"; but together they number 49 out of 515 lords temporal. "Every new peer of the United Kingdom is a non-hereditary legislator, and every such peer without heirs"—a class at present numbering 18—"is in effect a life peer." There are 26 non-hereditary lords spiritual. Then there are hereditary peers such as Lord Salisbury, Lord Rosebery, and the Duke of Devonshire, who are yet "essentially selected and representative legislators." Peers of large landed interest or

important commercial undertakings are "essentially representative," as also, in a wider sense, are ex-Colonial Governors. Recent creations carry with them a representative significance. Mr. Gladstone himself has added over forty-two members: no statesman has done more than he in this way to strengthen the House of Lords. A House directly elected often represents a party rather than the nation or the empire. The reviewer adduces a few instances to show that legislative capacity is hereditary. He also urges, with Mr. Macpherson, that the House of Lords "has been gradually losing its character of a baronage or assembly of territorial lords, and has become more a Senate." A more questionable statement is that since 1832 "we do not find that the House of Lords has prevented any great measure upon which the people had clearly pronounced their opinion." So much for the defence of the peers. Now for their amendment.

THE TWO PLANS OF REFORM.

Development along existing lines of change is the general policy advocated. "A brand new Second Chamber on entirely different lines" is set down as out of the question. The House of Lords must become still less territorial and more senatorial. Even the reviewer admits that "the difference between the ordinary and extraordinary size of the House is too striking to be desirable," and describes as a "grievance that a certain number of peers only appear in the House on rare occasions." "Life peers must be created, and the existing hereditary peers must elect representatives." These are the two principal plans, the first of which was rejected by Parliament in 1859 and again in 1869, but may be now ripe for adoption. "The number of life peers must be limited"; but Mr. Macpherson's classification of senatorial qualifications is rejected by his reviewer, who would leave selective discretion as at present in the hands of the first Minister of the Crown. The Irish and Scotch system of representative peers should be extended to the rest of the peerage, and the period of representation made in all three cases for life. But peers "who have held high office" should have seats by virtue of that fact, and so be exempt from election by their fellows.

A PAN-BRITANNIC PEERAGE.

Mr. Macpherson's proposal that "the whole five peerages should be amalgamated into one imperial and pan-Britannic peerage, and to this imperial peerage a representative peers system should be applied," does not win the approval of the reviewer. Local peerages carry the weight of a "local voice," which should not be lost. "The truly imperial character of the House of Lords would spring not from the representative position of this or that individual peer, but from the character and the capacity of the House as a whole."

With some dubiety the reviewer assents to the suggestion, that peers not in the Upper House might stand as candidates for the Lower. Mr. Macpherson approves of Archdeacon Sinclair's idea of including leading Non-conformist representatives in a reformed Second Chamber. But the reviewer opines that "the scheme is unworkable" on account of the great opposition which it would arouse.

The reform outlined above is pronounced to be—practical and possible, and it is essentially one which should emanate from a Conservative Government not averse to well-considered improvements of the Constitution. If a Bill with this object was passed through the House of Lords, it must necessarily be accepted by the House of Commons.

MR. FREDERIC HARRISON'S "HIGHER THEATRE."

WHAT IT SHOULD BE, AND HOW.

CONDESCENDING eulogy, caustic criticism, and generous ideals are curiously mingled in Mr. Harrison's paper in the October *Forum* on "The Revival of the Drama." He is quite ready to admit that the English drama has improved; but the area to which he restricts this admission is small. "It is easy," he says—

to sum up the features wherein the English stage of to-day has made distinct advance upon the stage of the forties and the fifties. First and foremost comes the artistic and intelligent setting of great historic plays; next, the rank and file at the best theatres can present modern life with some fair resemblance to what we see in the world, and not in a coarse stage convention; lastly, the melodramas of the second and third class have replaced intolerable burlesque by photographic realism, which, however pointless and ugly, is neither depraving nor absurd. These are distinct gains, but they are not gains of a very high order . . . Has our drama thereby become a substantive part, an essential, a beautiful part of our poetry and of our art? . . . Is it a trivial amusement or a true civilising force.

The compliment Mr. Harrison pays to scenic art he does not extend to the histrionic. He is cruel enough to say of our presentation of great plays:—

As *tableaux vivants*, the best of them are nearly perfect. Shakespeare would at last come to believe himself to be a mighty poet (an idea which on earth never seems to have crossed his mind for an instant) if he could see Mr. Irving's Hamlet, Wolsey, Shylock, or Mary Anderson's "Winter's Tale," or Mr. Benson's "Midsummer Night's Dream," Mr. Tree's "Merry Wives of Windsor,"—provided his ears had been carefully plugged with cotton wool. To the eye the effect is perfect. But this is not enough.

NO GREAT ACTORS.

For sixty or seventy years at least no really great tragedian has ever been heard in English . . . We all admire the thoughtfulness, the ingenuity, the varied accomplishments of Mr. Irving, of the late Mr. Booth, and of Mr. Tree and of others who are certainly actors of great merit; and Mary Anderson, Ellen Terry, Ada Rehan, Mrs. Langtry and the rest, are charming women, who at times touch a very sweet note. But when we come to measure our present tragic acting by a really high standard, we cannot count a single man of the first rank, nor a single woman of the second . . .

NO GREAT DRAMATIST.

Mr. Harrison asks, "Does the stage continue to add lasting works of real genius to our literature?" and answers:—

Tennyson wrote for the stage late in his career, doubtfully and without adding much to his established reputation. . . . Browning, Matthew Arnold, George Eliot, Swinburne, Lewis Morris, Buchanan, and many others, have written dialogues, lyrical dramas, and dramatic fantasias; but there is not one acting play among these pieces, nor has the stage of to-day ever coloured a line of them. . . . The vast bulk of our stage pieces are the work of playwrights rather than poets, and the severance of the purely literary and the theatrical world is very marked. It would be difficult to find any age or any country where the severance had been so complete.

THE CONDITIONS OF A GREAT THEATRE.

The most immediate cause is this—that the English stage of to-day, though sufficiently cultivated to form an occasional entertainment, is not sufficiently alive to occupy the serious hours of men of "light and leading."

Premising that "England is not, never was, and perhaps never can be, the home of the greatest acting," Mr. Harrison proceeds to seek a remedy, and takes care to enforce with almost sermonical iteration "the essential conditions of a really great theatre," which are:—

(1) A regular, trained, and judicial audience; (2) a peculiar position independent of speculation or fortune-hunting,

able to dispense with "runs" and "bumper" houses; (3) a company under absolute discipline playing before a school of criticism, of high culture, fearless independence, and paramount authority.

A great theatre would require a large trained body of actors, receiving regular and liberal salaries on a permanent engagement, with a stake in the fortunes of the house and a voice in its management, but otherwise liberally maintained and under strict discipline. The pieces must be varied, and both parts and pieces continually interchanged. The appointments must be beautiful, complete, and correct. The director must have complete control, and yet have no temptation to fill his pockets or to exhibit his own genius. These conditions involve, it is obvious, a large deficit at the end of the year.

How can this deficit be met? Mr. Harrison, who is "certain that in England and America the State will not contribute a cent," believes the day will come when the public spirit of private citizens will undertake this "social duty."

THE PILGRIMAGE REVIVED.

CHAUTAUQUA IN EUROPE.

THE summer of 1893 witnessed the assemblage of the second Reunion Conference in Switzerland. During this Conference an eloquent address on Chautauqua was delivered by its Chancellor, Bishop Vincent, and it is this address which has determined Dr. Lunn and Mr. Perowne to organise American Pilgrimages to the Old Country—on the lines first suggested in this Review in the article "A Plea for a Revised Pilgrimage." Dr. Lunn says:—

If I understand Americans aright, in visiting England they are much more desirous to have the privilege of hearing and seeing the living leaders of thought and action, of visiting places like Bedford and Stratford-on-Avon, associated with the great names of English history, than of witnessing the material prosperity of a Birmingham and a Liverpool.

The great cathedrals in which is enshrined the piety of our common ancestors, the great universities which gave their intellectual and spiritual training to saints and scholars whom both nations combine to honour, from Latimer and Crammer down to Butler and Wesley, and last but not least, our great national Valhalla at Westminster, are objects of transcendent interest to those Americans who are able to visit the home of their forefathers. I also feel convinced that the interest of a visit to any of these places will be multiplied tenfold when the cathedrals have their histories recounted by the dignitaries who dwell beneath their shade, when the colleges of our universities have their story told by great scholars enrolled amongst their professors, and when literary and religious shrines like Stratford and Bedford are visited in conjunction with lectures by eminent *littérateurs* who have shown true appreciation of the national worthies respecting whom they speak.

It is proposed that the Pilgrimage should leave New York, in the *Paris*, on January 10th next, the party being timed to reach Southampton on the 17th.

THE TOUR TO THE EAST.

In harmony with the Chautauqua principle, a tour to Egypt, Palestine, Greece and Italy has also been arranged. Lectures will be given at different points by the most eminent scholars of the day.

For Palestine, Egypt, and Greece, Messrs. Thomas Cook and Sons have undertaken the necessary arrangements.

Other pilgrimages on similar lines will be made to Rome, North Africa, and Spain. The pilgrimage to Rome and the East will start about February 6th from London, and the first educational party to Rome on February 5th, while the pilgrims for North Africa and Spain are to be at Gibraltar on February 21st. A full programme of all the tours has been printed, and may be obtained from Dr. Lunn, at 5, Endsleigh Gardens, N.W.

MISS WILLARD AND MR. SYDNEY WEBB:

ON THE STATE AS MOTHER.

IN *Our Day* for October, Miss Willard reports a lively conversation which she had in London with Mr. and Mrs. Sydney Webb, Lady Henry Somerset, and others. Miss Willard approached Mr. Webb, whom she describes as a "scientific Socialist," "a sort of typical Socialist by his very physiognomy," on the subject of Collectivism *versus* Individualism. This is the way in which, with his entire assent, she puts his views:—

"As I understand it, Mr. Webb, you think that just as a child that is to come into the world is now carefully prepared for and provided with everything that it will need, so before many generations that child will be not only mothered by its own nearest kin, but that the State will mother him all along his way through life, so that he shall never need to have an anxious thought concerning the questions, what shall I eat; what shall I drink; wherewithal shall I be clothed, and with what shelter shall I be provided? But all of these will be as certainly his as are air, water, and sunshine."

ORDERING THE MUNICIPAL BONNET.

Mrs. Webb said she believed the day would come when we should have municipal dressing establishments, and instead of a woman having to hunt out her spring bonnet and suit she would go first to the doctor who would give her a ticket for the sort of suit she ought to have, then to an artist who knew how to make it beautiful. She would not be "Mrs. John Smith," but "Type No. 16 A" under a head of "varieties," and would go to a subdivision of the great dress establishment for "the fair-haired," "the brunette," "the mother," "the young collegian," as the case might be.

THE ADVANTAGE OF LARGE LANDLORDS.

Asked how he would deal with the land question, Mr. Webb replied:—

By gentle and slow degrees we must make land common property, and to do this we must pension off land-holders. We can do it much more easily in England than in France, because in the latter there are so many small holdings, whereas we could, for a much smaller proportionate outlay, pay off the dukes of Bedford, Devonshire and Portland, giving them all the money they could possibly desire in return for their great estates, thus setting the land free so that the Government could place tens of thousands of the unemployed upon small farms and have them pay a moderate rent to the State. . . .

Just here Mr. Smith playfully asked the question, "If I give up my estates, what shall I do about my daughter Alys?" "Do," replied Mrs. Webb, brightly; "she could be the municipal dressmaker; with her talent and skill she would find plenty to set her hand to, and to be the head of the universal municipal dressmaking department is a position which a princess might envy."

A brisk interlude was created by Mrs. Webb—who evidently enjoys audacious fun—broaching the paradox, "I never saw a man, the most inferior, but I felt him to be my superior." Whereupon—she was most gently baited by the rest of the company.

A ROMAN CATHOLIC VIEW OF MR. GLADSTONE.

THE *Catholic World* for October contains a most enthusiastic panegyric upon the present Prime Minister, by Mr. Jeremiah MacVeagh. Not even the hoary Non-conformist, Rev. Guinness Rogers, could outvie this Irish Catholic in his overflowing laudations of Mr. Gladstone's powers, achievements, and character. What lends a less usual flavour to this eulogy is the author's explanation of his hero's onslaught on the Papacy in "Vaticanism." Mr. Gladstone, who published that pamphlet in his sixty-fifth year, is excused on the ground of his youth! Says Mr. MacVeagh:—

Few of his political pamphlets have attracted so much attention and comment as his pronouncement on "Vaticanism," the vigour of his attack on the Papacy and Catholicity—especially coming from the defender of the Oxford movement—causing no small surprise to students of his public career. His maturer judgment has led him to retract much of what he

wrote in the hurry and energy of youth; and only a few months ago he availed himself of a fitting opportunity to recant the charges of Catholic disloyalty—or rather the incompatibility of loyalty to the Pope and to the Queen—and the impossibility of good Catholics being good citizens; for practice and experience in public affairs had taught him that his theoretical deductions were illusive. The occasion was the introduction into Parliament by Mr. Gladstone last year . . . of a Bill to revoke and annul all Acts of Parliament which exclude Catholics from the Lord-Lieutenancy of Ireland and the Lord-Chancellorship of England. Here again, therefore, we find the Liberal leader educating his party and his countrymen, even at the expense of defeat and passing unpopularity. "A Jesuit in disguise," "A truckler to Rome," "A Papist at heart," are terms ethereal in their mildness compared with others which the introduction of the Disabilities Removal Bill provoked.

MONSIGNOR JACOBINI.

A Coming Cardinal.

UNDER this title Mr. Philip Hemans refers in *Merry*

England to his Excellency Monsignor Jacobini, whom I met in Rome four years ago. What I said of him in my book "The Pope and the New Era" is quoted by Mr. Hemans at length, as also is my interview with Cardinal Parrochi, the Vicar-General of Rome. The writer adds:—

Now that Monsignor Jacobini has taken lighter work, his health has improved; and all his strength will be taxed in future times when, as a Prince of the Church, he will be called to service still higher and more arduous than any he has taken hitherto. He will fulfil the appointed time as Nuncio before being invested with the Red; but that day is not now far removed. In making his face familiar to English readers, we may note that what is called the Social Policy of Leo XIII. has a warm supporter in Monsignor Jacobini. The Pope had a personal interest in these things dated from old days; but Monsignor Jacobini, if he did not plant, at least watered; and, in the near future, he will again be at the side of the Sovereign Pontiff in whom the advance of years only increases the desire to be of active use to the Church and to the world.

COMPULSORY STATE INSURANCE.**RESULTS OF THE GERMAN EXPERIMENT.**

Just as England in recent times supplied the classic experiment of industrial individualism, so now Germany subjects herself to the test of a discriminating State Socialism; and the process naturally commands the close attention of all students in the laboratory of international economics. One of these—Mr. John Graham Brooks—after five years' residence in Europe sends in a preliminary report to the September *Forum* :—

The three laws now in active operation in Germany are the law insuring against Sickness (1883), the law insuring against Accidents (1884), and the law insuring against Old Age and Invalidity (1889). Under these laws, with their several amendments, practically all the wage-earners who receive less than \$500 yearly have been insured.

THE SICK LAW GENERALLY APPROVED.

The first law (Sickness) utilises existing benefit and burial societies. In its seven groups of institutions—there are now about 7,000,000 insured members. The employer pays one-third of the contributions: the employed two-thirds. About one and a half per cent. of the normal wage is required for the labourer's contribution. In return he receives free medical care and all appliances, besides an amount equal to one-half his wage as sick money for thirteen weeks. Employers and employed take part in the management of the society, and there is, on the whole, general satisfaction throughout Germany with the results obtained.

THE ACCIDENT LAW COME TO STAY.

The second law (Accidents) visits the whole expense on the employers. The entire management is intrusted to sixty-four associations of business men, subject to Imperial control. The labourers are represented on the Arbitration Boards, to which, when aggrieved, they can appeal free of cost :—

The advantage to the labourer is the receipt of two-thirds his wage in case of disablement. If only partially disabled, he receives such portion of his wage as is believed to measure his degree of helplessness. If the accident result in death, twenty days' wages are given as burial money, and to the widow twenty per cent. of the regular wage, with fifteen per cent. to each child under fifteen years. The obligation is recognized to find work as far as possible for those injured in any business. As with the Sickness Law, there is every sign that the Accident Law will become a permanent part of Germany's social legislation.

OLD AGE PENSIONS THE CRUX.

But the chief difficulty and irritation are connected with the Old Age and Invalidity law. "A large proportion of the population would eagerly vote it out of existence if an opportunity were given." Why they would do so Mr. Brooks does not say :—

The law applies not to any mere trade, but to the whole mass of "labourers," beginning with the sixteenth year. Labourers are divided according to wages in four classes. The lowest class pays about 4 cents weekly, and the highest 6 cents, by means of stamps bought at the post-office and pasted each week on a card. The employer adds an equal amount, and the State to each paid annuity adds a yearly subsidy of 50 marks (\$12.50). This annuity is due at the completion of the seventieth year of age, and is paid even if the pensioner is earning full wages. "Invalidity" is defined as inability to earn one-sixth of the usual wage. All who have contributed for five years and are permanently disabled receive, whatever their age, the invalid pension. The average pension will not rise above \$45 yearly. . . In 1891 and 1892, more than 130,000 Old Age pensions were allowed. It is hoped that the pension age may eventually be reduced to sixty-five years.

GETTING TO KNOW HOW THE OTHER HALF LIVE.

Accidents have not lessened; strikes come oftener and with uglier mien; the hope that the insurance institutions would

check the rush of labourers to the cities has had no fulfilment, nor has the confident expectation that the charity burdens in towns would decrease. Yet under this legislation results of inestimable worth are being gathered, chiefly indirect and educational, that may help other countries even more than Germany, and Germany more in the next generation than in this. First, the real facts of the struggle for existence are being made known to the whole of society with an accuracy that has never before been approached.

The new knowledge has upset Lassalle's "iron-law," even in the socialist judgment, and will soon banish Marx's theory of "surplus value."

Second, a kind of popular science has sprung into existence for the study of industrial diseases and accidents, their cause and cure. An important exhibition of methods of prevention has been held in Berlin. An expert literature on the subject is being produced. Popular lectures are common, and regular courses have been introduced into three of the universities. Nearly a generation ago the statistician Von Kolb wondered what the comfortable classes would do if they could be made to see clearly, deeply, and without prejudice into the life of those upon whom the world's heavier drudgery falls. Under these insurance laws this exact science is being performed. Arbitration . . . is bringing the best expert medical science into the systematic service of the unfortunate among the working classes. . . "We find," they say, "that we cannot afford any but the best."

THE TWO PRINCIPLES.

With the English principle epitomised by Pitt in the words, "No public relief should be regarded as honourable," Mr. Brooks contrasts

the new principle which the German insurance assumes . . . that whatever adds *hopefulness and a sense of security* to those who are on the verge of poverty will be far more certain to inspire in them the active energies of self-help than any motives which spring from fear and disgrace.

The tenement-house question, with all that it implies, is perhaps the most fundamental of social reforms. One consequence of this insurance scheme is that the Government is at last definitely committed to the loan of insurance funds for building working men's houses. . . One already hopeful result shows itself in the more and more frequent gifts from private individuals.

Mr. Brooks is thankful that Germany, who has just now "the most powerful and most incorruptible state and municipal organisation which the world has seen," is willing to put such forces to the generous service of this great Social Experiment.

"EMPLOYERS' LIABILITY AS IT SHOULD BE."

MR. A. D. PROVAND, M.P., in a lengthy *Nineteenth Century* article, criticises the demands of the working-classes and the Government proposals in regard to the liability of employers. He proceeds to give his own definition of "Employers' Liability as it Should Be." An adequate Act should provide as follows :—

1. Every injury to be compensated for, however caused. On proof that the person is injured or killed he or his relatives to be paid the amount of the compensation.
2. The amount of compensation to be stated, and to be based on the wages of the injured person; except for apprentices, for whom a different scale must be made.
3. The employer, at his own cost, to cover by insurance the whole liability to the workmen.
4. All persons working for wages in the employment of another to be included in the Act.
5. The employer to be prohibited from contracting out of the Act.
6. Actions on the part of the employer or workman for compensation to be barred. Any point requiring adjustment to be settled by the Sheriff in Scotland or a County Court Judge in England or Ireland without appeal, no professional man being permitted to appear in the case.

IN PRAISE OF CHICAGO AND THE UNITED STATES:

BY THE "QUARTERLY REVIEWER."

THAT the place of honour in the *Quarterly Review* should be given to an eloquent, not to say enthusiastic, appreciation of Chicago and of the American people in general, is a fact "significant of much." Times have changed when a Conservative reviewer can say of the Western Republic, "The hopes of mankind are centred upon the mighty enterprise," or declare that "the emancipation of the negroes will remain the most striking moral event of our century," one which "has given pathos to the record of material expansion and to American principles a firmness and grandeur . . . worthy of so great a people." Chicago and its exposition furnish the occasion for examining afresh the prospects of American progress:—

THE COMING GLORIES OF THE LAKE CITY.

Chicago represents the industrial era without tradition, history, or a system of hierarchical government to temper its rule. . . .

We may predict a future for the Garden City which not even London can eclipse. It is, we say, the meeting-place of East, West and Centre, with the continents of the Pacific for a background that is yearly becoming less distant. . . . The age of steam and iron made London and New York. The age of electricity will see Chicago contending with them for the crown of commerce.

A NEW LINE IN HISTORY.

The reviewer is mightily impressed with the deep-seated orderliness and power of self-government which Americans possess.

Their enemies might define the American institutions as a recognised anarchy, with universal suffrage to make it perpetual. But surely they would be deceiving themselves with a vain sound. . . .

The American Government has struck out a new line in history. It is the very opposite of the paternal and the oligarchical. . . . It aims at nothing less than to carry into effect the idea of freedom until it has penetrated into every form of human life. A nation, in the English or French meaning of the word, America is not, and does not desire to be. . . . This idea of the sovereign individual . . . runs through American society from end to end. . . .

The American does not worship State authority, or those in whom it is for the time embodied, neither does he regard it as the one great instrument and the abiding channel of civilisation. To him it is but the means of accomplishing certain definite ends, which may perhaps be summed up in the defence of the nation against its enemies, and the enforcing of contracts made by private agreement.

Mr. Herbert Spencer would seem, we are told, "to have caught the very spirit of American institutions." Perhaps it is this theory of government which gives the British Conservative, threatened as he is with all manner of Collectivist demands, his new sympathy with the individualist American.

THE PURITAN STILL DOMINANT.

The reviewer sees in Chicago the product of "Puritan shrewdness and habits of industry, although now divorced from Puritan religion":—

The American farmer, take him all in all, is even yet old-Hebrew, believing in his Bible, unacquainted with any criticism which would endanger his creed or his morals, cautious, hard, and practical, by no means inclined to surrender the views in which he was brought up, and carefully to be distinguished from the "heathens of the great cities," who are mostly immigrants or their children. These . . . politi-

cally do not govern, and never will. The American spirit is fast subduing them. . . . Though religion, among the Americans, does not "exalt her mitred front in Parliament," the Churches exercise a power against which no active propaganda of unbelief has yet made itself felt, nor seems likely to arise.

The people, conscious of its strength, tolerates the corruptions and machinations of the political "boss," who, acutely observes our reviewer with his "heelers and workers," his packed "primaries," and his saloon "caucus," represents, under curiously varied circumstances, the old Greek tyrant of Syracuse or Agri-gentum.

The closing strains of this prose psalm to the genius of the United States take on quite a religious tone. "Freedom, equality of right, and a liberal spirit," which are "the elements of the American Constitution," are also, we are told, characteristic of ancient Athenian culture and of the New Testament itself—

which is at length beginning to be recognised as the standard of civilisation. In this triple cord, not easily broken, there seems to be a firm security against Anarchism, Communism, and all other assaults upon ordered freedom.

PLEA FOR AN ANTI-RADICAL COALITION.

THE *Quarterly Review* strongly desires to see the present "alliance" of Conservatives and Liberal Unionists changed into a "fusion." It recalls, however, Disraeli's dictum that England does not love coalitions. It devotes an article therefore to showing that there are coalitions and coalitions, and that while some are worthy of all reprobation, others have deserved well of the nation. Those that have failed have been almost always either directed against individuals, or else have resulted from a compact flagrantly corrupt. So failed the coalition formed in 1730 against Walpole, in 1783 against Shelbourne, and in 1852 against Disraeli. Of "coalitions which England certainly did love, and which were productive of the happiest results," two are cited: that of 1795, in defence of Constitution and Empire against "French principles," and that of 1835, to arrest "the too rapid progress of revolutionary ideas which followed the Reform Bill." These historical precedents lead to the generalisation:—

The notes of a healthy coalition are first that it should be formed for the sake of great principles, or else for the sake of public safety, not for the purpose of gratifying either personal prejudices or personal ambition; secondly, that it should be the result of a gradual approximation of opinions; and thirdly, that both parties should have tested, by experience, the possibility of their acting together on the great public questions of the day.

These conditions would, in the opinion of the reviewer, be as fully satisfied by a combination of Conservatives and moderate Liberals to-day, as they are violated by the alliance of Nationalists and Radicals. A readjustment of forces is needed to erect "another great barrier against social and political revolution."

The national peril seems to the reviewer to be as grave as that under James II. The Romish priesthood menace our liberty and empire now as then. A national uprising is needed. It is even suggested that the Queen ought to exercise her prerogative and dissolve Parliament. In any case, he promises the Liberal Unionists an open-hearted welcome from the Conservatives.

It is worthy of note that while frequent reference is made to the Duke of Devonshire, Mr. Goschen, and others, Mr. Chamberlain's name is never so much as mentioned.

THE TRUE STORY OF EVANGELINE."

THE MEN OF ACADIE IN ANOTHER LIGHT.

IN a series of articles which he begins in this month's *Inday Magazine*, under the title of "The True Story of Evangeline," Rev. T. B. Stephenson, D.D., comes to the rescue of the English name and fame against the unjust perceptions of Longfellow. He disavows any wish to suggest that Longfellow meant to strike a blow at the name and honour of our forefathers, who, a hundred and fifty years ago, were engaged in a death-grapple with France and came on the American continent. . . . Probably he did not know all the facts of the story with which he dealt, and we could be slow to believe that even for artistic purposes he could colour facts if he knew them. Yet the general impression made by the poem "Evangeline" is unjust to our forefathers. The injustice is the greater because ten thousand will take their impression from the poem for one who will patiently study the history. And to everybody who takes his share of the facts from the poem, the events . . . form one of the saddest chapters of causeless and remorseless cruelty the world has ever seen, and that cruelty stands charged upon our English race.

Dr. Stephenson points out that—

During two centuries the French and English were pioneering, praying, scheming and fighting for the mastery of the New World. And it was not merely a political struggle: it was in its depths religious. It was a fight of faiths as well as of races. France all the way through was the finger of Rome.

He narrates several blood-curdling incidents

as a sample of the proceedings which nourished the distrust of the colonists to a point at which all reliance on the honour of a Frenchman or the oath of an Indian became impossible.

He tells how one expedition set forth which

consisted of one hundred and five Indians, with one Frenchman, having Villieu at their head, and Thury to act as chaplain and bless the undertaking. Joined by a smaller party, under another Frenchman, they attacked a settlement now known as Durham The signal was given at night, and the slaughter began Among the scattered houses blood ran like water. More than a hundred women and children were tomahawked or killed by still more horrible methods. Twenty-seven were reserved as prisoners. Most of the houses were burned, but the church was spared, and therein Father Thury said mass and returned thanks to God for this victory, whilst the hands of his congregation were red with the blood of massacred women, and their clothes were bespattered with the brains of little children. Now this is a sample of what was continually taking place. The English colonists never felt safe.

Dr. Stephenson complains that "not a hint of all this is given in Longfellow's poem." Quite the contrary is suggested.

It is true that the curé of Grandpré had been rebuked by his ecclesiastical superiors for being too easy, and not zealous enough in stirring his parishioners to resent the English domination, and refuse the oath of allegiance. But . . . the representative priest of that region and that period was not the mild and reverent curé, preaching love and forgiveness, but Thury, offering his blasphemous *Te Deum* amidst the blazing houses of the murdered settlers.

Yet, in dealing with the French Acadians, the British Government had displayed that equity and tolerance for religious convictions which have marked its rule in every part of the world.

After this opening, the ensuing chapters of Dr. Stephenson's rebutting evidence will be followed with keen interest. But until an equal or a greater poet idealises with similar power the English side in that old-time struggle, the popular sentiment will we fear go with Longfellow.

TWO SOLUTIONS OF THE NEGRO PROBLEM.

MANUAL TRAINING OR MISCEGENATION?

THE story of General Chapman, educator of negro and Indian, is well told by Mr. Herbert Welsh in the *Educational Review* for September. The son of a missionary, and born in Hawaii, Samuel Chapman learned in his boyhood the secret of his later educational policy—

that manual training, with its humble material rewards, its firm disciplined muscles, its natural checks on sensual passions, its promise of honestly-earned bread, must go side by side with spiritual and intellectual training in any permanent uplifting of a barbarous people.

"Knowledge of the negro, first attained during his war service, was amplified and thoroughly assimilated in the reconstruction period immediately following the war"; and this led him to found the school at Hampton with the following idea:—

To train selected negro youth, who should go out and teach and lead their people, first by example, by getting land and homes; to give them not a dollar that they could earn for themselves; to teach respect for labour, to replace stupid drudgery with skilled hands; and to build up an industrial system, for the sake not only of self-support and intelligent labour, but also for the sake of character.

His motive—for he only had a single one: to get done the thing he felt God called him to do—was as transparent as a pane of cut glass.

It is not claiming too much for General Armstrong to say that he has given to the country, in its completest and most practical form, the key to the solution of the negro problem—certainly so much of a solution of it as the moment requires.

THE ENTAIL OF A NATION'S SIN.

Very different from this interim suggestion is "the ultimate solution" described by Mr. W. A. Curtis in the *American Journal of Politics* for October. No more terrible commentary on the curse entailed by slavery could well be found than this forecast,—that only by a colossal immorality on the part of American whites will the black problem be solved. Mr. Curtis declares that the negroes are already being absorbed by the white population:—

The absorption of the coloured population has depended and will depend upon a laxity of morals upon the part of both races, and a physical and a mental improvement in the inferior race. That such a laxity of morals exists, no one will deny. . . . The large and constantly increasing number of persons of mixed blood is proof of this. Save in the far Southern States, how few really black negroes there are. All through the border States the prevailing colour is not black.

The "six million coloured people are, at least, one-quarter white," and their amalgamation with the sixty-five million whites would produce a race possessing considerably less than one-tenth of "coloured blood." But the pure negroes in America increase very slowly. The real increase is among the half-castes. When negro morals discard illicit union, absorption will proceed by honourable marriage.

But what meanwhile of the infinitely darker than negro taint which will have thus entered the national blood?

A CORRECTION.—We regret that by a clerical error the price of Mr. F. C. Selous's "Travel and Adventure in South-East Africa," published by Messrs. Rowland Ward and Co., was given last month as 21s. instead of 25s. net.

THE BIGGEST WHEEL IN THE WORLD.

THE American edition of *THE REVIEW OF REVIEWS* has an interesting article upon the big toy of the World's Fair—the Ferris Wheel. In an interview, Mr. G. W. G. Ferris tells of the inception of the great wheel:—

We used to have a Saturday afternoon club, chiefly engineers at the World's Fair. It was at one of these dinners, down in a Chicago chop-house, that I hit on the idea. I remember remarking that I would build a wheel, a monster. I got some paper and began sketching it out . . . Before the dinner was over I had sketched out almost the entire detail, and my plan has never varied an item from that day. The wheel stands in the Plaisance at this moment as it stood before me then.

A SAMPLE OF AMERICAN DASH.

Given the circumstances, in no other country than America would the wheel have ever been built. It took three years to complete the Eiffel Tower. Even here it took two years to build the St. Louis Bridge. Both were comparatively simple work. The builder of the Ferris wheel had not only to construct a work equalling these, but in such a way that it would move, and, moreover, move perfectly—a far greater problem.

On December 28th every scrap of iron and steel used in the wheel was "pig." On June 21st, less than six months later, 2,200 tons of this "pig," converted into a revolving mechanism as perfect as the pinion-wheel of an Elgin watch, began to turn on its 70-ton axis, and has been turning, without let or hindrance, without creak or crack, ever since . . .

It took excavations thirty-five feet below the surface and through twenty feet of quicksand and water to obtain a suitable footing. The towers, eight in number, are twenty feet square and thirty-five feet high, of solid cement. To keep this cement from freezing, live steam was used. Buried in the concrete are massive steel bars, and to them are bolted the steel towers which rise one hundred and forty feet in the air, supporting the wheel. To topple over the wheel it would be necessary to uproot these cement towers.

MEASUREMENTS OF THE GIANT.

It is not easy for the mind to grasp the stupendous nature of this undertaking. The wheel

itself is two hundred and fifty feet in diameter; at its highest point it is two hundred and sixty-eight feet above the earth. That is to say, if Bunker Hill monument were used as a yardstick to measure it, the towering monolith would fall short fifty feet. The obelisk of Luxor or Trajan's pillar, at Rome, would not be long enough to serve for a radial spoke.

Then, again, as to its enormous weight. The Niagara cantilever, just below the Falls, was looked upon as an engineering wonder when it was built. Its construction required three years. The Ferris wheel was built in five months, and its weight is four times that of the Niagara bridge. It has thirty-six cars, and in these two regiments of soldiery could be seated and swept with an almost imperceptible motion high above the White Wonder.

WHIRLING WITH THE WHEEL.

The sensation is delightful. Of course you expect to be dizzy, seasick, disturbed by the motion of the cars. And you

AN "EDGEWISE" VIEW.

MR. G. W. G. FERRIS.

are disappointed. As the wheel stops and you enter the cars, you treat yourself to an anticipatory shudder. The door closes, the clank, clank of the immense link chain as it falls over the sprocket wheels begins again. Doubtless the car will start shortly. It seems a long time about it, however. You look out; the Midway Plaisance, with its strange medley, is sinking below you. Soon it is far beneath. In front, the towers and long, gleaming pavilions of the White City are lifted into view. Then, slowly, with that subtle, growing sense, such as you experience as you stand before the canvas of

A SECTION OF THE WHEEL.

a Master, the whole majestic panorama is unrolled before you. Suddenly there is an almost imperceptible thrill, some one announces that the wheel has stopped, and as you look below you become aware that you have been lifted two hundred and fifty feet in the air.

The Ferris wheel was begun and completed within six months. It was constructed in sections, shipped to Chicago and put together there. Not a rod, joint or bar was defective; the whole was joined together with an ease and rapidity that astonished even our own engineers. When it was complete, it was perfect to the last detail, and it has never required an hour of repairs. The Eiffel Tower was three years in building, and its imperfections were not surmounted while the exposition lasted.

Plea for Rate-aid to Church Schools.

THE first place in the *Church Quarterly Review* is given to an argument for rate-aid to denominational schools. The writer deplors the hard conditions which these schools are now obliged to face, urges the rights of consciences which demand, as well as of those which decline, definite religious teaching for the children, and insists on the grievance of Churchmen and others who have to pay, besides subscriptions to support their own schools, rates to maintain Board schools. He argues for the adoption of a clause which Mr. Forster consented, under pressure, to drop from his Bill of 1870—"a clause enabling School Boards to make grants to the voluntary schools within the sphere of their authority, the only condition being that, if a grant was made to one such school in a rating district, an equal grant should be made to all the others."

He maintains that, State-aid being now granted, there can be no logical objection to the granting of rate-aid.

The indispensable conditions on which the friends of definite religious education must insist . . . in their irreducible form . . . are two: the one is, that they shall retain perfect freedom to teach religion in the manner they think best; and the other is, that they shall have a prevailing voice in the selection of the teachers.

Among "subsidiary questions" he mentions the ratio between rates and subscriptions; the proportion of managers who may be elected by the rating authority or the parents, but who must never equal in number those elected by the subscribers; the veto of the rating authority on the nomination of teachers; and the conditions on which new schools should be erected.

He would prefer the County Councils or District Councils to the Education Department for the fixing of the amount of aid to be given to voluntary schools from the rates. His devotion to the Catechism may be inferred from his alleging that what the multiplication table is to the teaching of arithmetic, the catechism is to the teaching of religion.

CINDERELLA AND THE GOSPELS.—In *Folk-Lore*, Mr. Joseph Jacobs, while investigating and classifying the manifold form of the story of "Cinderella in Britain," indulges in a curious digression. He says:—

We have to deal here with various versions of a series of incidents preserved by tradition and reduced to writing after many days. Now this, to compare great things with small, is exactly the problem of the Synoptic Gospels. It is not by any means improbable that folk-tale research, by arriving at the laws governing the transmission of narratives by tradition, may ultimately come to the aid of theological science in determining the relative age of the Gospels and settling the amount and character of the alterations undergone by the narratives during the process of tradition.

CO-OPERATIVE COOKERY:

ONE SOLUTION OF THE PROBLEM OF THE KITCHEN.

THE waste of womanhood that continually goes on in our kitchens is a sad satire on our social wisdom. The organisation of industry, which has done so much in other spheres to economise labour and to enlarge life, we obstinately refuse to carry into the domestic sphere. As a consequence, we keep on squandering the one sort of paid female labour which is most in demand, and persist in dissipating a great part of the housewife's life. It is the sacrifice of the woman that should be wife and mother and queen of the home and sister of the people that is most pitiful. We take some of the very best human energies to be found in our working and lower middle classes, and we deliberately melt them over the cooking-stove or turn them into the smoke of the kitchen fire. Happily there are signs of a revolt. Even the kitchen, the last stronghold of feudal caste and archaic economy, seems likely to yield to the invasion of the democratic spirit and of co-operative methods. In the *North American Review* for October, Catharine Selden discusses how her sisters may be emancipated from "the tyranny of the kitchen." Her anxieties are directed rather to the housekeeper than to the domestic servant, whom she evidently considers not sufficiently grateful for the advantages of her position. As an alternative to the more extensive employment of Italian or Chinese labour, she suggests—

a co-operative enterprise of some kind, which by furnishing meals at a definite time or place, or by distributing them for home consumption, would lessen the demand for household service. . . . We are already accustomed to buy our confectionery and many other articles from establishments organised especially for their production. There seems no reason why cooked meat and vegetables should not be brought from similar sources of supply. It would not be difficult to found establishments of the nature of club-houses from which wholesome and well-cooked food could be distributed. . . . Thirty families might just as well have their dinners cooked in one kitchen by two or three cooks, as in thirty kitchens by thirty cooks. Instead of thirty ranges with their enormous consumption of fuel, one fire would be sufficient for the same purpose. There are also many labour-saving contrivances, economical devices and facilities now wanting in the home which could be made available, with the capital at its disposal, in the family club-house. In other words, what we want to do is to combine the conveniences and organisation of commercial life with the privacy of home and the independence of the individual.

She would provide the family club with a restaurant for such members as preferred not to take meals at home, and with reading and recreation rooms for employees. She thinks that the club might become a training school of the highest value. "A great deal of teaching which, elsewhere dispensed in infinitesimal quantities and lost in dispersion" would be thus "crystallised into tradition." Woman, whom she regards as "the most practical and disillusioned part of mankind," would find "an outlet for aspirations founded on practical ends." But, with a singular distrust in the present capacities of her sex, the writer urges that

the initiatory management of the family club, whatever might be its final administration, ought to be undertaken by men. They are not only used to organising large enterprises, but from habitude such burdens are lightly borne.

WHAT SOCIETY WOMEN READ.

LADY CHARLES BERESFORD ON "REVIEWED LITERATURE."

THE first place in the *Woman at Home* is given to an illustrated interview with Lady Charles Beresford, in which Mr. Blathway's matter is more than usually entertaining. He thus pictures the new features in her residence at Richmond:—

Deep and cool, full of barbaric colour, instinct with the life of the Oriental countries, in which she would really prefer to spend her days, are these charming drawing-rooms. Upon the walls hang numerous trophies of past exploits in the field on the part of her husband . . . and side by side with them are the portraits of the people she has met during many years.

After some bright talk about Egypt, Lady Beresford was asked if she considered "women in Society" better read than formerly. She answered:—

Well, yes, I suppose they are on the whole. Perhaps, however, I am no judge of this. They appear to me to be not so sentimental, so mawkish in their tastes; they are more brilliant, more widely informed. I don't think, however, that this proceeds from any burning desire on their part to be better educated, but because the facilities afforded them are so much greater . . . The mass of "reviewed" literature of the present day must be a great boon to the purely "Society" woman of this *fin de siècle* period, who really has no time to read thoroughly and to think out things for herself; the mass of *reviewed* literature is so great that to have an original idea on any subject whatever must surely be the exception . . . Sometimes—now and again—I fancy that there is in the purely worldly woman—"pleasure-seeker" we will call her—a desire to improve herself intellectually because it is the "right thing" to do so. So in a certain more "advanced" and perhaps "enlightened" section of Society the smart lady in dressing for a ball or a party may, during the intricacies of the back hair process, reflect that she may be placed at dinner next to some charming author or rising politician. She therefore glances over some review, or some review reviewed by Mr. Stead, in the hope of being mistaken for a "soul"; and, by the way, the attempts of some who are not qualified to rank amongst this more thoughtful section of society, or to peep into the only circle in London life that has elected to be a little out of the common, have been amusing to witness.

"Reviewed literature" as an indispensable adjunct to a Society lady's toilet is verily an interesting sign of the times. A yet more satisfactory fact is the tribute Lady Beresford pays to the influence of public opinion on Society morals. "It is generally noticed," she says, "that the most 'pronounced' set has for some time found it difficult to gather fresh recruits."

Shafts, a magazine for women and workers, edited by Margaret Sibthorp, is a publication for those who possess a brain to think and a heart to feel for human advancement. In no other way can this be so effectively aided as through the press, and those women who are attempting to strengthen their sisters' hands in this work extending their horizon of enlightened judgment and teaching them to act wisely, are doing a good work. Women are not merely asserting but proving their right to be heard on a score of questions heretofore considered out of their province. The world has been trying for centuries to advance in civilisation, but under the veneer of brilliant discoveries, increasing culture, and greater physical comforts lie deeps below deeps which can only be reached by women whose brains, hearts, and hands are trained to meet great issues. It is idle to cry out against women taking a share in the great questions of the day. The world does not move backward, and to-day their position as a factor in human progress is practically what they choose to make it. *Shafts* is published monthly at four shillings per annum, single numbers threepence.

FIRST-FOOTING: ITS ORIGIN AND LAWS.

MR. G. HASTIE, in *Folk-Lore*, ascribes to the custom of first-footing—which is observed “with great glee and vivacity in various parts of Scotland, but more especially in Edinburgh,” and he might have added in the North of England also—a comparatively recent origin. He says:—

The origin of this nocturnal visit and welcome, and subsequent merrymaking, arose from marriage customs, mostly in Galloway and Wigtonshires, where marriages were generally celebrated on New Year's Day. About a century ago the young maidens of the district, who might be courting, would, on the approach of New Year's Eve, in a coaxing kind of a way, invite their sweethearts and companions to be their first-foot on New Year's morning; of course the hint was always readily accepted, and generally ending in due course by marriage on a subsequent New Year's Day.

He seems to think the end of the practice is nearer than its beginning:—

Now the inducements of recreation and amusements of every description instead, is (*sic*) fast bringing into disuse and distaste the “auld, auld custom of ‘first-fittin’ in Guid Auld Scotia.”

WHO ARE LUCKY AND UNLUCKY.

Writing in the same quarterly on “First-footing in Aberdeenshire,” Mr. James E. Crombie thus states the result of his inquiries into the good or bad luck of certain classes of first-footers:—

The following were considered lucky: Friends, neighbours, and all well-wishers; a kind man; a good man; a sweetheart; people who spread out their feet (Old Machar); those who were born with their feet foremost (Old Machar); a man on horseback; a man with a horse and cart; the minister (?); a hen.

The following are some of the persons or objects considered as unlucky for first-footers:—Thieves; persons who walked with their toes turned in; persons who were deformed, or whose senses were impaired—cripples, for instance; a stingy man; an immoral man; a false pretender to religion; the hangman; the gravedigger; the midwife (New Machar); women generally; and all who were suspected of being addicted to witchcraft; those whose eyebrows met, and males who had red hair. Among animals, the cat, the pig, and the hare.

How British Trade Vanquished Napoleon.

THE commercial rivalry between France and England, which lends its keenest edge to the Siamese question, is of old standing. It was at the bottom of many of the wars of last century; and in a suggestive article in the *English Historical Review*, Mr. J. H. Rose shows how much it weighed with Napoleon in his European wars.

The policy attributed to Napoleon of isolating Great Britain from the rest of the world was only developed by him from attempts commenced by the French Revolutionists.

They believed England's wealth to be essentially vulnerable and artificial. They hurried into war with her in 1793 with the avowed hope of closing against her the chief markets of the world.

Bonaparte, in his skilful selection and use of all the Jacobinical ideas and aims which could establish his power, found none more ready to hand, none more popular, than commercial jealousy of England, and the determination to make our wealth our ruin.

These led him to develop the “coast system” into the “Continental system” in the Berlin decrees. Mr. Rose will not deny that British statesmen in retaliating had before them ends scarcely less extensive.

There is indeed room for belief that the policy of the Orders in Council was an attempt, not merely to retort on our enemies the evils of their own injustice, but also to crush neutral commerce, and establish a complete maritime monopoly.

Fortunately for us this colossal duel fell at a time (1803-12) when—

the relations of our industry and agriculture to our population rendered us at once necessary to Europe and self-sufficing at home. . . . The mistake of the French Government was in supposing that we were *solely* dependent on foreign trade.

“The Continental blockade strangled the Continental system.” Russia could not stand the absence of English goods, and in 1812 came to a commercial arrangement with the British Government. As a result, “English goods began to pour into Central Europe by way of Riga.” Napoleon could not suffer this huge gap in his system, and consequently—though the cause was veiled under personal recriminations—the Grand Army went to Moscow.

The attractiveness of English manufactures was thus the direct cause of Napoleon's downfall.

HOW AN EVENING PAPER IS GOT OUT.

MR. EDWIN H. STOUT contributes to the *Young Man* a vivid account of the way an evening paper is produced. He thus describes the hours of highest pressure:—

The din of the morning publication has hardly died away when the evening begins. By six o'clock the office of the evening paper is being prepared for the work of the day, and by seven the compositors and the early birds of the editorial staff are on the scene. The mail bags have to be opened and their varied contents assorted—and the correspondence of a newspaper is no light affair. Letters to the editor—stupid, serious, and impertinent; articles—good, bad, and indifferent; news—trumpety, libellous, and important; they are there in heaps to be dealt with according to their merits.

Before eight o'clock everything is in full working order. The editor is considering what subject he will tackle in his leading article; his assistants are writing notes on the topics of the day, and giving the finishing touches to the special articles which have been prepared for the forthcoming issue; the sub-editors are “boiling down” the more important items in the morning journals, and preparing the fresh telegrams from correspondents or news agencies which have already arrived. . . . As things are now managed, the bulk of what appears in the earliest editions of an evening newspaper must be in the hands of the printers before ten o'clock; while the leading article, for which a little extra grace is allowed, has to be finished by about half-past ten. Before eleven the last of the proofs must be passed, and a few minutes more suffice for the corrections to be made, and the “formes” to be sent to the foundry. . . . By half-past eleven the bundles are being handed over the counter of the publishing office, and the express carts are driving off to distribute them throughout the metropolis and at the railway stations for conveyance to distant suburbs and country towns. Before midday we have thus a complete newspaper produced and in the hands of the public. The work of the day is, however, by no means over. Four, five, and even more editions have still to be prepared.

Mr. Stout questions the commercial wisdom of issuing so many editions.

THE editor of the *Journal of the Royal Agricultural Society* has done his readers a specially good turn this quarter. Aware that the drought of the summer has made the prospects of the stock-farmer for the coming winter unusually gloomy, he has secured from ten experts resident in the districts which are likely to feel the pinch most, a series of independent “Suggestions as to Stock-feeding in the Winter of 1893-94.” One point in which most of the writers concur is that straw is too precious to be used as bedding or litter this season; and a variety of substitutes are suggested.

THE SINE QUA NON OF EMPIRE.

"THE command of the sea," its meaning in general and its meaning for the British Empire, are very clearly and strikingly set forth in an article in the *Quarterly Review*. It faces us at the outset with the seeming paradox that just when the Battle of Trafalgar had won for Great Britain the "command" of the sea, she voluntarily relinquished the "sovereignty" of the sea. "Sovereignty," it appears, required "the striking of the flag and the lowering of the topsail from every foreign ship" met with. "Command" is a much more serious affair.

KEEPING THE IMPERIAL HIGHWAYS OPEN.

The reviewer defines the command of the sea as meaning "complete freedom of maritime transit, military and commercial." It can be secured and maintained only by the destruction, or at least the complete neutralisation, of any organised naval force capable of interfering with an enemy's freedom of transit. . . . There is no such thing as a partial or incomplete command of the sea; it is either absolute or it does not exist. An admiral who commands an undefeated fleet, even though it is inferior to its immediate adversary, can always frustrate a serious territorial attack on the country he serves, so long as he can avoid a decisive engagement . . .

"A FLEET IN BEING."

A fleet in being, too large to be treated as *une quantité négligeable* by an adversary opposed to it, is an absolute bar to all serious enterprise, maritime or territorial, on the part of that adversary. Maritime enterprise on a large scale must necessarily involve a decisive engagement, and this, of course, the commander of the inferior fleet will do his best to avoid. Territorial enterprise, on the other hand, is, as we have seen, the one naval operation of all others which requires an undisputed command of the sea as a condition indispensable not merely to its success but even to its inception.

These were the principles upon which Torrington acted at the Battle of Beachy Head. Not provided with a sufficiently large fleet to vanquish the French, he saw the paramount necessity of keeping his "fleet in being" by retreating. The reviewer devotes most of his article to vindicating the reputation of this Admiral against the fierce odium of his contemporaries which Macaulay has done his best to perpetuate.

But while "a fleet in being, undefeated and able to avoid a decisive engagement, is an absolute bar to invasion across the sea," the maintenance of our Empire demands much more. It demands our absolute command of the sea. This is not merely the tenure by which alone we hold the Empire. It is also the title, the indefeasible title, by which we can at any time claim the transmarine possessions of any European Power which cannot defeat us at sea. Every Power in the world holds all its transmarine possessions merely as the caretaker of the ultimate naval Power. If England is that Power, every such possession is hers for the trouble of taking it whenever she is at war with the Power which holds it. If she is not, her Empire is at an end.

UNIVERSAL NAVAL SERVICE.

It is idle to increase our army, if our fleets are not supreme, and superfluous if they are. Those who talk loosely and longingly about universal military service as necessary to England's defence, might well be invited to consider whether universal naval service is not rather the counterpart, in the circumstances of the British Empire, of the universal military service imposed, by other circumstances and conditions, upon the Continental nations. Assuredly no military strength would save us if our naval strength were to fail.

"The question is not whether our Navy is superior and far superior to any other, but whether it is so far superior to any probable combination of naval adversaries as to be incapable of losing the command of the sea." With the answer returned to this question by the present Government, the reviewer is far from satisfied.

THE COLONIAL PARTY AT WESTMINSTER.

A STEP TOWARDS "A TRULY IMPERIAL PARLIAMENT."

"THE Colonial Conference"—the body which has been formed by the fifteen returned colonists now in the House of Commons and twelve other members whose interests and sympathies are strongly colonial—is the subject of a sensible article in the *Contemporary* by its secretary, Mr. Hogan, M.P. He expects it to be joined shortly by a contingent of peers who have served or governed in the colonies, and thus to develop into "an unofficial joint Colonial Committee of both Houses." Composed of all parties, its members "are all of one mind on the great questions of imperial policy," and on the necessity of securing more attention in Parliament to the interests of Greater Britain. This unofficial body is not designed in any way to clash, but rather to co-operate, with the official Colonial Agents-General.

ITS PROXIMATE PROGRAMME.

Its existence would have done much to prevent Lord Derby's blunder of refusing to permit the annexation of New Guinea, and may now operate beneficially to settle the Newfoundland, New Hebrides, and Samoan questions in the colonial interest. Mr. Hogan adds—

Other subjects that may fairly claim consideration at the hands of the Colonial Conference are: a uniform penny postage throughout the Queen's dominions; improved cable communication with the colonies; the organisation of imperial defence; the legislation of Colonial Government Stock for trustee investments; a more scientific and less haphazard system of appointing colonial governors; the assimilation of patent, copyright, and company law throughout the Empire.

THE ULTIMATE AIM.

The mere formation of this standing Conference has, Mr. Hogan affirms, been hailed with great enthusiasm at home and in the colonies, and has already evoked widespread and unexpected "aspirations for a genuine Imperial Parliament"—in which the colonies should be directly and duly represented. Mr. Hogan is not sanguine of soon beholding the reconstruction of the Empire on a representative basis, which Mr. Robert Lowe advocated in the Sydney Legislature so far back as 1844. But he regards it as the ultimate goal.

No workable scheme by which the colonies can secure direct, adequate, and satisfactory representation at Westminster has yet been devised, nor can we entertain any well-grounded hope of such a desirable consummation until such time as the Australasian and South African colonies are federated on the Canadian model. With the Greater Britain beyond the sea organised and federated into three homogeneous, powerful, and well-defined groups, there ought to be no insuperable difficulty in the way of allotting to each group its due and proportional share of representation in a genuine Imperial Parliament.

The Classical Ideal of Man.

THE ideal of human character which lay behind the classics of Greece and Rome, and which has so largely moulded modern conduct, is analysed by Rev. J. Rie Byrne, in the *Humanitarian*, into these elements: "piety," manliness, constancy and fortitude, fidelity, discipline, justice, spotless honour, a self-respecting sense of shame, temperance in food and in drink, unresting activity, liberality, frugality, occasionally clemency, ambition in the good sense and not in the bad, erectness of soul, taste for study, eloquence, affableness, wit; in addition, good fortune, noble birth, wealth, beauty, youth, long life, modesty in dress, grave and dignified deportment, tallness. Mr. Byrne notices as defects from a Christian point of view the absence of a sense of sin, of humility, and of charity or love to God and man.

THE WORLD'S PARLIAMENT OF RELIGIONS.

THIS noteworthy experiment has been carried through with singular success. The science of comparative religion has received an advertisement such as rarely falls to the lot of any of the sciences. Once supposed to be exceptionally recondite and abstruse, it has been made visual, personal, popular, in the city of the World's Fair. The opening scene is described as having been an imposing pageant. The gorgeously robed hierarchs of many historic faiths, present on the same platform, and uniting in simultaneous acts of worship, formed a spectacle which kindled the imagination not less than it impressed the reason. It seems to have been one of those events which make up the dramatic element of history. Rev. H. R. Haweis, who was present, feels that it will "leave a mark upon Christendom equal to, though differing from, the new departure created by the Protestant Reformation."

The *Review of the Churches* has an interesting account of the Parliament contributed by Rev. Dr. Gilbert, editor of the *Chicago Advance*. Of the inaugural ceremony he says:—

The large hall was packed with an audience of not less than four thousand men and women. Not ever before did a single platform have gathered upon it a group of men so widely representative at once of the various races and nationalities and religious faiths of the world. The spectacle presented to any one at all sensitive to the infinite pathos of the sorrows and the hopes that take hold on both time and eternity was of overwhelming interest. And one grand effect of it must inevitably be to awaken in the hearts of all thoughtful religionists, Christian or non-Christian, what one may call a new "world consciousness." If not a wholly new, it is a vastly broader horizon that is now seen to bend over and include them all. Whatever any one's blindness, any one's waywardness, any one's enlightenment, any one's painful gropings after the Light that should lighten every man coming into the world, the fact was felt most profoundly that we all are the one Father's children.

SPIRIT OF THE DELIBERATIONS.

Of the general course of the meetings Dr. Gilbert remarks:—

Here was an open parliament, offering to each one chosen to speak the utmost freedom in the expression of his own positive religious convictions. It was no debating society. There was nothing of the cross-cross jangle of controversy. And a most beautiful dignity and well-bred courtesy on every side ruled the hour and pervaded the place. But it must not be imagined that all the speakers piped low and soft. Not at all. There were clouds big with thunder; and there were thunders with lightnings in them that smote as with strokes from God's own right hand. This was especially true when [speakers were] characterising some of the awful inconsistencies of so-called Christian peoples and Christian governments in their relation to other nations. In all there were not less than one hundred and fifty papers and addresses, each from one half to one hour in length, besides many shorter and more off-hand speeches. . . . Those appointed to take part in them appear to have felt deeply the transcendent significance of such an occasion. And the audiences were hardly at any time less than three thousand.

PROBABLE RESULTS.

Distinguished representatives of all the great historic faiths and world religions, those of India and of China and Japan, those of Europe and America, Jew or Christian, Greek or Roman or Protestant, have come together, looked into each other's faces with kindest eye, clasped friendly hands, met not only on the public platform but in elegant social gatherings and in most hospitable homes, and continued thus as with one accord for many days. . . . Nevertheless, since the World's Parliament of Religions has become a fact accomplished, the world's religious thought can never again be exactly what it

was. Once out of its shell the eagle can never return into it. Confucianism, Brahminism, Buddhism, Shintoism, Judaism, Mohammedanism, Christianity, they each have been asked to tell what they have to offer or suggest for the world's betterment, what light they have to throw on the problems of the individual soul, on the labour problems, the educational questions, and the perplexing social conditions of our time. Their answers have been given. There will at any rate be a greatly improved mutual understanding. Deep has called unto deep; the various answers to humanity's deepest necessities and supreme desires and aspirations are on record. More and more intelligent and devout men and women will study and compare. That which has been most conspicuous has been, not the difference between men and men, between Christian and Buddhist, but the difference between the Gospel of the one Saviour of the world and the teaching of all the other systems of religion.

CATALOGUE OF CHARACTERISTICS.

Dr. Joseph Cook in *Our Day* for October thus summarises the session:—

Chief among the facts concerning the World's Parliament of Religions, held at Chicago for seventeen days in September, are that it would not listen to a defence of polygamy; it applauded every denunciation of international injustice; it exalted the religion of Conscience; it courteously concealed the seamy side of the non-Christian faiths; it gave an eager hearing to every sound scheme of philanthropy and practical reform; it exhibited Protestant, Catholic, and Greek Churches in agreement as to the conditions of the peace of the soul; it received with great favour thoroughly orthodox evangelists; it asserted most devoutly and incisively the Fatherhood of God, the brotherhood of men, and the solidarity of the race; it united Christians and non-Christians every day in the Lord's Prayer; and, to use Dr. Barrows's words, it ended at Calvary.

A CURRENCY INDEPENDENT OF GOVERNMENT.

MR. W. H. VAN ORNUM, writing in the October *Arena*, thinks he has found "a key to the solution of the whole financial question." The present commercial crisis is due, he avers, to want of currency. Either there is not enough in existence, or it is restricted in its circulation. But money "is purely a certificate of credit." And—

why should business men depend upon government to furnish or sanction any particular form of currency? And why should they continue to furnish capital to the banks, without security, on which to carry on their speculations, at the customers' risk and the bankers' profit? It is entirely unnecessary. . . . The New York and Chicago clearing-houses have recently . . . put out, for temporary purposes, clearing-house certificates, some say as high as \$23,000,000 in New York alone, which are only certificates of credit, having the backing of the associated banks, and which are perfectly good, so far as they go, for all purposes of money. There is nothing to hinder business men from doing the same thing. They can form mutual associations for their own convenience and credit, to facilitate their own business. Each member can be rated for credit according to his financial ability or business probity, being guided by the same considerations as now enable the banks to determine the credit of customers. Then let the association issue to each member respectively certificates of credit, in denominations corresponding to the present paper currency, to the full amount of the credit allowed, which will circulate as money, backed by the credit of the whole association. . . . The association will constitute a co-operative bank for the benefit of its members, in which the certificates of credit will be deposited, to be checked against or added to in new deposits like any other bank account. The bank, being for the mutual convenience of its members, need not and ought not to make a profit. It should discount no notes, deal in no securities, exact no interest, or in any way risk the money of its members. For the running expenses, each member should pay enough to cover the cost of the individual service to him.

HODGE HIS OWN BANKER.

IF IN ITALY, WHY NOT IN ENGLAND?

"We have enfranchised the labourer politically, we must enfranchise him economically." This is the principle on which Mr. Bolton King bases a suggestive paper in the *New Review* on "Parish Councils and Allotments." He points out that all the labourer's aspirations are to "make himself independent of the farmer," and that allotments are doing more than any other agency to lessen drunkenness and check the migration townward. Mr. King welcomes the Parish Councils Bill as showing a great advance:—

But in its present form it contains one great and vital defect: it retains the one-acre limit of the Allotments Act, and so makes it impossible for a man to hold more than an acre under the Parish Council. Most fatal of all, it entirely precludes the acquisition of grass allotments; for to be of any value, two and a half or three acres must be their minimum size.

The labourer to be a holder will need capital. Mr. King warmly urges the introduction of People's Banks, which have been so successful on the Continent, into this country. His account of them is given here in condensed form:—

Doing a business of £200,000,000 a year, these banks have revolutionised the condition of the peasantry in Germany, and bid fair to do the same in Italy. The area of each *cassa* does not extend beyond its village. The self-interest of the other members secures that none but persons of good character are admitted. The association is self-governing. The liability of members is *unlimited*; but so perfect is the security that "the public banks are glad to lend at one-half and one per cent. below market rate." It is truly the "capitalisation of honesty"; for the members of these banks are among the poorest of Italian peasants. From the funds acquired by bank advances, and from the savings bank deposits, loans are made to members for the purchase of stock or implements or manure, or to the village tradesman for raw material.

The moral transformation these banks have made in villages has been as striking as the economic.

"A NEW AUSTRALIA."

MR. A. J. ROSE-SOLEY contributes to the *Westminster Review* a vivid and fervid description of a singular socialistic exodus from New South Wales. Its leader and originator is William Lane. Born in agricultural England, he spent his boyhood in America, whence he removed to Queensland. A prosperous journalist, he flung himself into the labour movement, and at last, impatient of the slower social evolution, he conceived the idea of starting a Communistic settlement of Australians in a totally new environment. "In July, 1889, New Australia was but a dimly-seen dream. In July, 1893, two hundred of its pioneers were leaving the old Australia for the new, a thousand male adults were inscribed on the Association's lists, representing, with women and children, a total of two thousand, and these members, whose numbers are daily increasing, devote all their hard-earned savings to the common fund." It secured a suitable site in Paragnay, South America, where the "New Australia" is to develop. Each colonist pays £60 minimum entrance fee. Equality of the sexes, sanctity of home-life, communal care of children under guardianship of parents, are among the chief articles of constitution.

**"THE YOUNGEST EDITOR IN THE WORLD,"
AND HER "HOLIDAY COTTAGE."**

THIS distinction belongs to Lady Marjorie Gordon. She is the daughter of Lady Aberdeen, and though still in early girlhood does actually edit *Wee Willie Winkie*. So Miss Friederichs informs us in her pleasing sketch of the little woman in the *Young Woman*:—

It is a very pretty story, that of Holiday Cottage, which stands about half a mile from Haddo House, on the borders of a wood. In order that their children might be better able to appreciate the difficulties and delights of housekeeping, Lord and Lady Aberdeen had this cottage fitted up with all the goods and chattels of a humble home, except that there is no

LADY MARJORIE GORDON.

sleeping accommodation in it. You walk across the field and turn into the wicket-gate of a small cottage-garden, where Lord Haddo and the Hon. Dudley and Archie Gordon grow potatoes, cabbages, and strawberries, and where, perchance, you may see the three brothers dig and delve, fetch water from a pump in the neighbouring field, mend fences, polish door-knockers, chop wood, or make themselves otherwise useful. Lady Marjorie grows roses and other flowers in this garden, and all the four owners of Holiday Cottage are intensely interested in a tiny rockery close to their door. . . .

In this kitchen Lady Marjorie practises all the details of housekeeping. If the floor is dirty, she scrubs it; when the grate is cold, she kneels in front of it and cleans it, and lays the fire; the brightness of the cutlery and crockery depends on her handiwork; and if the owners of Holiday Cottage invite guests to tea or luncheon, she must prepare whatever refreshments she offers to them.

HOW TO USE THE CAPITALIST

WITHOUT ABUSING HIM.

"THE Psychology of Labour and Capital" is the somewhat abstruse title of a racy and entertaining article in the *Fortnightly* by Mr. Robert Wallace, M.P. He laughingly rebukes the Socialist for describing the capitalist as a beast of prey, and urges that the two phases of human nature—the phase of labourer and capitalist—are two and inconvertible. Mr. Wallace finds three main distinctions between the born capitalist and the born labourer—classes and types which of course often overlap:—

(1) The capitalist is a being of vaster cupidity than the labourer. . . . He wants to possess all he sees, and his desires are really bounded only by the resources of the planet. . . . On the other hand, the man who is essentially a labourer has not this passion for possession. He can guide a plough, make an engine, paint a picture, impersonate a character, write a poem. That is about all he is fit for.

The capitalist aims to annex, the labourer to transfigure, Nature:—

A second distinction between the two lies in the capitalist's capacity for using his brother men as his tools. This is a remarkable faculty, possessed in perfection by comparatively few. For he must be able to say to a multitude of fellow-creatures, identical with himself in every anthropological characteristic, "It is the right thing that you should dwell in hovels, but that I should dwell in a palace: that you should wear fustian and corduroy, and live on herrings and potatoes, but that I should be clothed in purple and fine linen and fare sumptuously every day." Once a keen annexionist has faced the position from this point of view, he may go far in capturing large segments of the world. If he falters, he will never do much good as a capitalist. The genuine labourer, on the other hand, be he poet or ploughman, is not equal to this, and hence remains a labourer all through.

The third difference is the most striking: The capitalist

must have, on a greater or smaller scale, capacity for organisation, ability to combine men, materials, and opportunities into a unity which, as an adaptation of means to end, he can handle as an instrument for raking in towards himself the largest quantity of possession that is meanwhile accessible. According to his powers in this direction he develops into a small or a colossal capitalist. . . . Faculty and the faculty of organising faculty are, as a rule, lodged in different skulls, and the organising faculty is among the rarest of human faculties. . . . To all practical intents and purposes, the born Worker is helpless apart from his own special gift, and the born Organiser is less usefully fitted for working himself than for setting other people to work.

Suppose your Socialist State set up, says Mr. Wallace: the capitalistic brain would soon capture the State; or organise—as none else could—a counter social revolution. Its cupidity would not tolerate restricted income.

Mr. Wallace's own plan is to use the capitalist, not abuse him; not to extinguish him, for we can't; nature is too strong for us, but to regulate him. Factory Acts and a graduated income tax are instanced as means of harnessing the cupidity of the capitalist to the car of the general welfare. We must only be careful not to tax him down to the point at which he will cease to find it worth his while to organise industry for us.

I think it certain that a large amount of the excessive reward of capital could be safely recovered through taxation.

5s. A WEEK FOR THE AGED POOR.

A PROJECT OF POOR LAW REFORM.

In the year ending Lady Day, 1892, according to a recent Government return, the persons aged sixty-five years and upwards who were in receipt of parish relief numbered 401,904, while of the population of that age, "one in every three (females) or four (males) was relieved." Rev. J. Frome Wilkinson, commenting on these facts in the *Contemporary Review*, remarks that "the economic position of the aged and ageing has not improved during recent years, but rather the reverse."

WHAT GRANTHAM AND SHEFFIELD ARE DOING.

He mentions that the Grantham Board of Guardians already grant a weekly allowance of 5s. 6d. to men above seventy-five years of age, of 5s. to women above seventy, and of 9s. to an old married couple living together. A special committee of the Sheffield Guardians has recommended that for the accommodation of aged and infirm people over sixty years of age, who are of good character and have lived in the Union for twenty years before applying for relief, a three-sided quadrangle should be built:—

Each room is to be furnished with the necessary household utensils, and besides bed, two arm- and two rocking-chairs; and the rooms are to be made in every way as homelike as possible, with the help of pictures, plants, etc. The inmates to be allowed to retain any unobjectionable pet animal or object to which they have become attached; to be encouraged to cultivate a small garden with flowers and vegetables for their own use; and to be allowed the fullest freedom within the necessary limits of reasonable discipline.

WHAT THE DISTRICT COUNCIL OUGHT TO DO.

Mr. Wilkinson's own suggestions may be thus epitomised:—

The District Council, which shall carry on the administration, should be entrusted, subject to supervision by the County Council, to be empowered to grant "a minimum sustenance endowment of 5s. a week to all aged persons who send in a demand note," except such as are held to have forfeited their right to pension, and are, therefore, to be sent to the workhouse. The pension to begin in each case "when decay of working powers becomes manifest." Municipal or village cottages to be purchased or erected by the District Council and let for a small weekly sum to aged inhabitants of the district. The old-age endowment fund to come from imperial rather than local taxation.

Mr. Wilkinson points out that old-age pensions can be granted even under the existing law. The Act of 1834, in section xxvii., provides that any two acting justices may give relief to any adult, unable from age or other infirmity to work, without requiring him to go into the workhouse. This suggestive article closes with a plea that the State, having by its profusion of liquor licenses, tempted the poor to drink, should not in its character-test judge too severely those who have yielded to the temptation.

As noticed elsewhere, the Bishop of Ripon suggests in the same Review the utilisation of existing parish doles in an old-age pension fund.

THE number of British medical men in Egypt, says the *Medical Magazine*, "might be counted on the fingers of one hand." "An immense number of European practitioners, chiefly Greeks and Italians, but including also Germans, Austrians, and French, may be found thronging the principal towns; but our fellow-countrymen will not follow their example. . . . The country requires sanitary rehabilitation from one end to the other, and nothing could conduce more to this most desirable end than judicious leavening of properly qualified medical men."

THE THREE PARTIES BOUND FOR THE POLE: THEIR CHANCES OF SUCCESS.

No fewer than three separate expeditions have been despatched this year with the object of discovering the North Pole. The Norwegian party has Dr. Nansen at its head, and goes by the New Siberian Islands, or the Asiatic route. The British party, under Mr. C. R. Jackson, goes by Franz Josephland—the usual European route. The

followed by Jackson presents a most promising field," and if his equipment is adequate "there will be good reason to expect from Jackson's efforts quite extensive additions to our knowledge of Arctic lands, and possibly the attainment of an unprecedentedly high latitude." For his own countryman Peary, General Greeley thinks "moderate success most probable;" but "as to his attaining the farthest north and mapping out the north-

MAP USED BY DR. NANSEN TO ILLUSTRATE THE PAPER WHICH HE READ TO THE ROYAL GEOGRAPHICAL SOCIETY

American party, and the American route, will pass through Baffin Bay, under Lieutenant R. E. Peary. The several prospects of the parties are discussed by General A. W. Greeley, in the September number of the *North American Review*. It is interesting to find that this distinguished Arctic explorer pronounces the British prospects of success to be most favourable. "The route

eastern boundaries of the archipelago discovered by Lockwood, his chances of success are inconsiderable—say one in ten." Dr. Nansen's project of "a drift-voyage with the main ice-pack of the Siberian Ocean," which is supposed to set across or in the neighbourhood of the Pole, is condemned as "unwise, impracticable, and little short of suicidal."

RUSSIA VERSUS WESTERN EUROPE.

PRESUMABLY as a concession to popular feeling, the second number of the *Revue des Deux Mondes* contributes a valuable addition to the Russophile publications of the month, under the title "How Russia Took Her Place in Europe," by M. Desjardins, member of the French Institute. The article is really a review of an elaborate historical work compiled by a well-known Russian journalist, F. de Martens, with the permission and assistance of the St. Petersburg Minister of Foreign Affairs. Therein may be found an account of all the treaties and conventions concluded by Russia with foreign powers, and M. Desjardins has managed to weave out of dry political documents a striking page of old history.

Russia's first relations with Western Europe seem to have begun in the glorious reign of him who was called the Russian Charlemagne, a certain Iaroslaf the Great, who flourished between the years 1015 and 1054. He made good use of his female relations, marrying his sister to the King of Poland, and his three daughters to the Kings of Hungary, Norway, and France. Marriage, indeed, seems to have played a great part in Russian diplomacy, for the next close connection between the great Eastern Power and its neighbours took place in 1496, when the then Tzar's niece married a nephew of Maximilian of Austria. Russia's first serious relations with England began in the middle of the sixteenth century, when a certain Anthony Jenkinson, an astute English merchant, became the confidant and friend of the then Tzar, Ivan IV., to whom he granted all kinds of privileges for himself, and for a company, the *Muscovite*, in which he was interested.

All went well for some years; then, in the April of 1567, the Tzar commissioned his friend Jenkinson to ask the Queen of England (Elizabeth) whether she would become "the friend of his friends and the enemy of his enemies." This, however, did not suit the Queen's views, and for some years diplomatic relations between the two countries were severely strained to the utter undoing of Jenkinson and his Muscovite company. In 1593, however, the Tzar bethought himself that an English bride might make matters straight; and he sent his ambassador, Bisenky, to ask for the hand of Mary Hastings, whom M. Desjardins speaks of as having been a niece of Elizabeth; the negotiations, however, fell through owing to the death of the Tzar.

To Peter the Great belongs really the credit of having brought Russia within the circle of European politics, and he may be said to have first thought of a Franco-Russian alliance; "he owned," writes St. Simon in his famous memoirs, "an extreme passion to become united to France."

But the Tzar's celebrated visit to Paris unfortunately took place some years too late; in Louis XIV. he would doubtless have found an ally and friend, but the Regent was no diplomatist, and practically threw the Tzar into the arms of England. Catherine, remarks M. Desjardins, began her reign by an exchange of compliments with England and Russia, but, finally, was more often unfriendly than friendly with the Court of St. James—although George I. was in constant communication with her, writing her long autograph letters in which he would point out their many common interests. M. Desjardins has only continued his researches up to the end of the eighteenth century. It is to be hoped that in a future number of the *Revue* he will tell the story of Russia's later relations with her European allies and enemies.

IS ITALY GROWING TIRED OF HER KING?

THE recent successes of the Catholic party in many local elections throughout Italy encourages Signor R. Corniani to elaborate in the pages of the *Rassegna Nazionale* a programme for what he terms the new Conservative party in Italy, from which he hopes great things in the future. The party is to consist of the Moderates of both camps—Catholic and Liberal; and, indeed, it is precisely by a combination of this kind that the above-mentioned successes at municipal elections have been won. Where the Catholics are intractable, the Moderates vote with the Radicals; on the other hand, they are quite ready to join with the Catholics, when feasible, as a protest against the rabid sectarianism and materialism of the present régime.

The author also notes an, as yet little suspected, but, if true, important factor in Italian politics—i.e., the waning popularity of the House of Savoy. Rightly or wrongly, the many and obvious misfortunes under which Italy is groaning are attributed to a failure in the monarchical principle, and discontent is spreading rapidly amongst the moderate Liberals, who, until now, have been the most stalwart supporters of the united monarchy. Royalty has failed to do much that was expected of her; she has, moreover, done many things which have proved undoubted blunders. With this decline of popularity of the reigning House there disappears one of the main difficulties of a *rapprochement* with the Catholic party. Ultimately Italy might find in a federated republic a solution for some of the unsolvable problems of her present political condition. The principles which are to govern the new coalition party are summed up by Signor Corniani in the following paragraph:—

Both sides demand a greater respect paid to Catholicism, both as a sentiment and an institution; both parties desire public instruction to be purified from materialistic and anti-religious influences; both wish for a scheme of public finance which will not exhaust public and private prosperity; all desire greater freedom of municipal life, an administration independent of party politics, a real decentralisation and simplification of bureaucratic methods, liberty of election, and a union between real education and popular instruction.

The *Foreign and Colonial Importer* (Wm. Duff and Co.) is a monthly journal for the export trade, which gives the export prices current and the produce market reports. Apart from the trade notes and articles there is much of general interest in this well-printed journal.

THE *Young Man* and the *Young Woman* are wedded, so to speak, for Christmas, one Christmas number being made to do duty for the two magazines. There are sixty-two pages for 6d., but sixteen of these are devoted to advertisements; but why, oh why, does the editor sprinkle his advertisements all over the book? It is so very irritating to pass from a poem about Christmastide to a page about somebody's electric belt, or to be plumped from the pathos of a street idyll into a "patent miniature melodeon." The letterpress, however, is entertaining and elevating. The stories are supplied by Annie S. Swan, H. M. Stanley, Barry Pain, W. J. Dawson, J. Reid Howatt, and others. There are articles by W. T. Stead, Mrs. Crawford (of Paris), Archdeacon Farrar, etc.; and the special feature of the illustrations seems to be the portraits of the editors of the two magazines in question, and of some of their leading contributors.

THE FUTURE OF ENGLISH IN INDIA.

THE part which the speaking of English is manifestly destined to play in the unification of mankind imposes on its present guardians the duty of doing their utmost to keep the language one, and to prevent it breaking up into dialects not mutually intelligible. There are two articles in the *Calcutta Review* which serve as forcible reminders of the danger of neglecting that duty. Mr. Charles Johnston, M.R.A.S., discusses the general relations of ethnology and philology. He acknowledges that recent anthropology has shown "four quite distinct race-types in Europe alone, all speaking Aryan languages, but none corresponding exactly to linguistic divisions." But he vigorously combats Mr. Isaac Taylor's declaration that "language seems almost independent of race." This notion he derives from the erroneous identification of language with vocabulary. But "besides vocabulary, language consists of grammatical structure, accent, tone, and phonetic type." The behaviour under new race-conditions of each of these elements is subjected to a most interesting investigation, which Mr. Johnston finally thus sums up:—

Taking first vocabulary, it appears that, as far as its constituents are concerned, it has very little relation to race; perhaps none at all; but as far as its scope is concerned, it is very largely dependent on race. Grammar also seems to be, if not dependent on race, at least liable to great influence from it. Tone and accent seem also dependent on race; while phonetic mould is overwhelmingly so. So that five-sixths of language are dependent on race; while only one-sixth—too often mistaken for the whole—seems practically independent.

BABU ENGLISH TAUGHT IN GOVERNMENT SCHOOLS.

If we apply these principles, as Mr. Johnston does not, to the probable future of our imperial speech, we get a prospect not too reassuring. For, as five-sixths of language is dependent on race, and as the English-speaking area is extending over an enormous number of different races, what will be the linguistic result? Apprehension is deepened by the statements of another reviewer, who signs himself H. R. J.:—

It stands as a gigantically ludicrous fact to-day that the supreme powers in the Indian Empire, having undertaken to introduce the science and literature of the West into India through the medium of the English language, have failed to evolve any considerable number of trained scholars who may be trusted to speak and write the English language with even tolerable correctness and intelligence. . . . The Universities send out yearly hundreds of youths . . . addicted to a very vile habit of writing and speaking English. . . . Not half the students in our college classes are really fitted by their knowledge of English properly to benefit by the books that are put into their hands to study and the lectures they are invited to listen to.

"One great and evident cause" is that the colleges "have tried to impart teaching in English without taking sufficient precautions to ensure that English should first be taught." What H. R. J. demands, in the first place, is therefore "gradually raising the standard of English in the so-called Entrance Examination." As "the supply of men educated after the received pattern exceeds the present demand," the restriction of numbers which a higher standard of entrance would involve need not deter us.

But the source of the evil lies further back—in the schools preparing men for the Universities:—

The teachers of English in these schools are almost entirely native masters—an intelligent and deserving class of men, no doubt, many of them with University degrees, but nevertheless men with a very imperfect mastery of English idiom. . . . There is probably—I speak under correction, yet not altogether

at random—not a single school in the whole of India where there is a reasonable chance that English will be correctly and idiomatically taught to the Indian schoolboy. A vicious habit of expression is acquired by our scholars from the first.

The reviewer urges that we should have one school—"if possible, in every Presidency, and if not, then one at least in all India"—"in which English is taught from the beginning by Englishmen, thoroughly, systematically, soundly," and which could serve as model for the rest.

There is something more than grotesque in the spectacle of a British Government laboriously propagating through the Indian Empire a spurious dialect, neither English nor native.

A GLIMPSE OF PERSIA AND PERSIAN SOCIETY.

IN the *Nouvelle Revue* of October 1st, Ahmed Bey gives a striking picture of modern Persia, and of its Governmental institutions. Persia, he tells us, is divided into provinces or *hokoumets*, and each province is divided into districts or *mohals*, which again are divided into cantons or *belads*. Each district boasts of a Governor and Vice-Governor. The Governors are generally chosen from among the members of the Shah's family. They do nothing, and have no dealing with the people over whom they reign. The Persian administration shares with that of many more civilised countries the reputation of being excessively corrupt. Everything is done by bribery. The Government openly sells the posts it has to offer, from Ambassador to a Government clerkship. On the other hand, the poor are heavily taxed, and those who cannot pay have not only their lands, but even their houses and personal effects seized.

Ahmed Bey quotes an extraordinary little ballad which he declares is sung among the people *apropos* of the tobacco monopoly, which is said to practically belong to Great Britain. A rough translation of the verses may be useful, inasmuch as they point out the way in which we are regarded in the East:—

Tell me, O Grand Vizier, have you seen the Sal Shah (Salisbury)
In his London Palace? Did he get round you, Goose?

O Grand Vizier! O Sal Shah!
One gave over the money; the other gave his country,
And each of them is pleased! O.

If the Queen only knew—for of course it is hidden from her—
That we are miserably poor,

O Grand Vizier! O Sal Shah!
She would not have taken from us our bitter tobacco—
The one gave the money, the other his country,
And the two are pleased! O!

In Persia there is, so to speak, no judicial system; all law cases, civil or criminal, are judged by some *mollah*, who always decides in favour of him who has paid most. The army is singularly recruited. Every landed proprietor has to furnish a certain number of men, and to equip and feed a certain number for an indeterminate time. The Government gives them their guns, and, generally speaking, provides for their lodging. Each soldier is expected to look out for himself and live by theft or violence.

Ahmed Bey evidently looks with suspicion upon the friendship of England and Persia, and would like to see Russian influence predominate in the country. The Shah, his sons, and his Ministers, all have their fortunes invested in British banks, and so naturally it is to their interest to keep on good terms with the Court of St. James. On the other hand, the Persian merchants wish to be on the best terms with Russia. There will come a moment, says the writer of the article, when Persia will become the battleground of England and Russia, for the Shah has four sons, two of whom at least are likely to consider themselves the rightful heir to their father, and no one yet knows who will be supported by the Court of St. James.

THE ADVANCE OF WOMAN:**ITS DEMANDS AND DANGERS.**

A SYMPOSIUM on the "Women of To-day" is counted to the October number of the *North American review* by two women and two men. The Earl of Meath is how the late Lady Sandhurst, Miss Cobden, and ss Cons fared on the London County Council and in Law Courts, and puts the case for lady councillors with trenchant conciseness. He sees in the "public cognition of the ability of women to work side by side with men" "an encouragement to reformers on both les of the Atlantic":—

A victory on one side of the ocean would soon be followed an advance upon the other. I am sufficiently patriotic hope that the honour of first admitting women to local councils may rest with the land of my birth.

Catharine Selden's device of family clubs as an escape from "the tyranny of the kitchen" is noticed elsewhere.

MOTHERHOOD IMPERILLED.

A very grave indictment of the American system of female education is brought forward by Dr. Cyrus Edson:—

Expressed in the fewest words, the evil is that an increasingly large proportion of the women of the American race are unable to perform their functions as mothers, and these women include the mentally best we have among us. . . . The gravity of the evil confronting us lies in this, that we seem to be able to bring the women up to a certain point in mental development, and then they cease to be able to be mothers.

He finds also that the power to resist attacks of disease, which in less cultured peoples is greater in girls than in boys, is in America distributed rather the other way. The only explanation he can suggest is "the tax which by our system of education we put on these girls," during changes in their physical development involving heavy drain on the strength. This saps their stamina and destroys their reserves.

PLAIN SPEECH ON A GROWING EVIL.

I once heard a married woman say: "Women are growing very scientific in these days." It is a fact that a very large number of American women now refuse to bear children. Ideas have changed. The religious sentiment which forbids efforts to prevent the accomplishment of the natural function of their sex has been greatly lessened in force for many of them. To no class in the community is the realisation of what is going on so vivid as to physicians, because to them the sufferers from the results of their own acts must come for relief. It is almost useless to point out the terrible consequences of this interference with Nature, or to say the exchange is pain during a short period avoided and pain during life secured. . . .

So far as the act is the result of a dislike to be deprived of the pleasures of society by the care of children, it is damnably wrong. So far as it results from the dread of the pain of childbirth, it is folly so absolute that it may not be expressed in words. But when it is the result of an innate feeling that there is not stamina enough to stand the strain—what then?

HEALTH WILL TAKE THE PLACE OF BEAUTY.

Dr. Edson thus forecasts the result:—

If the system of education prevents American women having children, and if the influence of those women is strong enough to put a stop to any change in that system, or if those women refuse to be mothers, American men will, so far as they can, marry girls of other races. In time there would gradually permeate through the minds of men the understanding that health was a requisite in the women they would make their wives. Healthy girls, girls with stamina, would then have the same advantage over their less fortunate sisters that is now possessed by the pretty girls over those that are ugly.

But as "the women of America are not fools," they may,

he thinks, be looked to for initiating reform in female education.

In another part of the magazine, Jane C. Sinclair laments the dangers attendant on educating boys and girls together. The results in the West are not as expected. The young men "treat women as well as they treat one another, and no better," with "extreme" and even "ill-bred familiarity." The moral standard is not perceptibly raised. "That most of the girls come out unscathed from dangerous situations is no reason why they should be exposed to such dangers."

WHY SHOULD NOT MARRIED WOMEN BE SELF-SUPPORTING?

Bertha M. Rickoff pleads for the removal of social dis-favour from women who work for their living. She deplores the subordinate tasks allotted to them, and the way in which they discredit their work by regarding it simply as a makeshift to be abandoned for marriage at the first suitable opportunity.

The fact that the American woman of to-day should be competent to supervise the management of her household by no means necessitates that she become a practical workman in each branch of its industry. Nor need the household be less cared for because she is self-supporting, for a business or professional training will rather give her a more thoughtful direction for her energies, and she will learn the money value of system and concentration.

Women, if self-supporting, would be able to keep a servant who now cannot afford it.

The very question of household service would begin to solve itself did it become a recognised and permanent industry, not a makeshift preceding marriage.

If educated women engaged in work worthy of their capacity, by this influx of energy the hours which a business or a profession demands of a man would be decreased, and he would be afforded opportunity to share in the influence over his children, an influence which should be exerted by the father as well as the mother.

And before marriage, self-supporting women will be afforded opportunities for contact with desirable men, which are denied the society girl.

"THE REAL EMANCIPATION OF WOMEN."

Mrs. Helen Watterson in the *Forum* for September declares that—

in this country a woman's world is as wide as a man's. There is nothing she may wish to do that she has not the fairest chance at trying. Best of all a woman may, if she chooses, do her work . . . without attracting special notice because of her sex. But of this chief right, Mrs. Watterson complains, the modern woman will not avail herself. She will not quietly do her work as a human being, but persists in calling attention to the fact that it is *woman's* work. Why, pleads the writer, perpetuate the sex-consciousness which men have now abandoned? Why lay stress on the fact that women are new-comers in any field of work? Why introduce or emphasise false distinctions like sex-distinction into work? Why "obtrude the fact that women are not equal to men in units of horse-power?" To do so, Mrs. Watterson urges, is to lower women's wages. "Of men workers and women workers there is no distinction, but only of work." She is particularly severe on the woman's exhibit at the World's Fair, as a national illustration of women's useless and harmful "excitement about 'woman.'" It not only misrepresents clever women as precocities and so depreciates ordinary woman's work, but it overlooks woman's greatest work—of rearing sons in the ways of upright men, and teaching daughters the glory of womanliness. "The real emancipation of woman will come only when she is emancipated from herself."

MASHONALAND AND ITS INHABITANTS.

MR. J. THEODORE BENT contributes to the *Contemporary Review* a bright if somewhat discursive account of "Mashonaland and its People." He cannot understand any enlightened person standing up for Lobengula, and "the misery, butchery, and dastardly cruelty" which his raids into the Company's territory produce. He insists that—

nothing but making a clean sweep of the Matabele out of the country and driving them across the Zambesi can settle the matter. Then, if a series of forts is erected to prevent their return, Mashonaland and Matabeleland may hope for a time of peace and prosperity.

Mr. Bent holds out no prospect of the Mashonas or even of Khama's men proving of much use as fighting allies. In all South Africa "there is not a tribe which can stand up to the Zulu." He describes Mashonaland as containing some forty thousand square miles suitable for colonisation, as having an improving climate, and as producing even under native cultivation excellent rice, tobacco, tomatoes, sweet potatoes, chillies, and ground nuts. But "it is really on its gold mines that the future of Mashonaland depends; without gold the country is not sufficiently rich to warrant colonisation. It could doubtless be self-supporting without gold, but as a speculation it would be valueless." Locomotion is difficult. Roads have to be cut through a thick thorny bush. The scenery is not beautiful so much as peculiar and weird, the flat plateau sown with the strange piles of granite called kopjes being its distinctive feature. Mashonas have the same methods for smelting and forging iron as those used in Abyssinia and Arabia, and show many traces of a tincture of Arab blood.

MASHONA RELIGION.

They are reserved on the subject of religion.

From what we could gather during our wanderings, I should say that the Mashonas believe in a vague supreme spirit, or god, which they call "Mwali." They do not appear to pay any direct worship to this spirit, being doubtless too infinitely vague to their minds, but instead they sacrifice to their ancestors, who act, they suppose, as intercessors between them and the Supreme Being, or at any rate have better means of knowing more about it than they have.

Where the Mashona is free from Matabele raids, his "timid cringing manner" is exchanged for "decidedly noble bearing and splendid physique." Beside Matabele raids, drawbacks to colonisation are found in the unhealthiness of the climate for horses and cattle, and the tsetse-fly, "a small grey fly, about the size of an ordinary horse-fly," whose bite is fatal to all but native quadrupeds, and which has already cost the company many thousands sterling. "Salisbury, Victoria, and Umbali will undoubtedly be the chief towns of the new colony." Salisbury, which stands five thousand feet above sea-level, on a kopje rising out of a large plain, is the healthiest of the three, especially since its neighbourhood has been drained by the company.

A TAKING PORTRAIT OF KING KHAMA.

Mr. Bent prefaces his article with this sketch of our Bechuana ally:—

King Khama is a model savage, if a black man who has been thoroughly civilised by European and missionary influences can still be called one. He is an autocrat of the best possible type, whose influence in his country is entirely thrown into the scale of virtue for the suppression of vice. Such a thing as theft is unknown in his realm; he will not allow his subjects to make or drink beer. "Beer is the source of all quarrels," he says; "I will stop it." He has put a stop also to the existence of witch-doctors and their wiles throughout all the

Bamangwato. He conducts in person services every Sunday in his large round *kolla*, or place of assembly, standing beneath the tree of justice and the wide canopy of heaven in a truly patriarchal style. He is keen in the suppression of all superstitions. . . . Khama, in manner and appearance, is thoroughly a gentleman, dignified and courteous; he wears well-made European clothes, a billy-cock hat and gloves, in his hand he brandishes a dainty cane, and he pervades everything in his country, riding about from point to point wherever his presence is required; and if he is just a little too much of a dandy it is an error in his peculiar case in the right direction.

EULOGISING THE UNIVERSE.

SIR EDWIN ARNOLD'S THEODICY.

AMONG the many recent onslaughts on pessimism, for which apparently we have to thank Mr. Chas. Pearson's sombre anticipations of the world's future, perhaps the most cheerily eupeptic is the address which Sir Edwin Arnold delivered at the Birmingham and Midland Institute last month, and which appears in *Longman's* for November. Sir Edwin is evidently in the best of humours with himself and with all the world; his paper bubbles over with high spirits. He is "glad to have lived," is "well satisfied with his share in the world." Pessimists seem to him to be "stupid." Everybody admits the value of lightheartedness for children; and if for children, why not for all? He would like to see

A MINISTER OF PUBLIC AMUSEMENT

sitting in every Cabinet, and municipalities spending freely on recreation for the people. He sketches the material side of a Birmingham artisan's life and asks if ever king of old fared so royally. All parts of the world supply his table with luxuries such as Heliogabalus or Lucullus never enjoyed. Sir Edwin merrily derides the idea that the discoveries of Copernicus and Darwin in any way require us to abandon "endless hope and utmost probabilities of immortal and ever-increasing individual gladness." He cannot pass over Prof. Huxley's recent aspersions on the ethical nature of the "cosmical process." Has not evolution itself produced both the professor and his lofty ethical standard? The morality has come forth from the alleged immorality. "In the brain and heart of man" Nature attains to that noblest goal of all morality embodied in Christ's Golden Rule. Is there not a clear demonstration here of the fundamental and far-off beneficence of the cosmic process if we will only get two foolish notions put out of our heads—one that the universe was made for us alone, and the other that death is an ending and an evil?

Health is improving. "The average number of days of sickness in every decade for each man is said to be only sixteen." Crime and pauperism are decreasing. "The cosmic process in our own little corner of the universe is not doing so badly! Sir Edwin "would be content to trust a defence of the cosmic scheme" to the

MOTHER'S LOVE

for her offspring. He agrees with the American woman who said to him, "God Almighty can't be everywhere at once, and so I guess He invented mothers." He glories in the certitude of immortality and declares Asia in respect of this faith to be far in advance of the West; the poorest peasants of India to stand at a point of view far beyond Priestley and Hegel. He recommends as an antidote to pessimism the reading of a page or two from Whitman's "Leaves of Grass," which teach you that—

the spells which bring us into harmony with the cosmic process, are, faith in its purpose, work for its furtherance, and fixed goodwill towards all creatures.

IMPERIAL FEDERATION AND THE UNITED STATES.

HOW THE MARQUIS OF LORNE WOULD RELATE THEM.

THE royal connection and political standing of the Marquis of Lorne make the chief significance of his article in the *North American Review* for October, on "The Latest Aspects of Imperial Federation." It is refreshing to find the son and heir of the present Duke of Argyll not afraid to suggest that the movement with which he stands identified is one to Americanise the Constitution of the British Empire:—

Is it not possible that the ideas vaguely adumbrated under the name of "Imperial Federation" may only be a development of the American idea as shown in the United States Constitution? If not alike, the ideas are certainly not antagonistic.

Speaking of the effort as intended to prevent the repetition of separation, he proceeds:—

Is this action such as to harm the United States? On the contrary, it will probably be made to favour them. It does not by any means follow that Australia or the Cape or Canada, sundered from the merely nominal imperial tie they now have, to keep, or cast away as they choose, would be more friendly to the Washington Government, than as constituent parts of a confederation of English-speaking lands, such as is contemplated by the imperial federationists. . . .

Any bond among states governed on English law would be a bond acting in favour of friendship and alliance with the United States. The want of such a bond and the gradual dismemberment of the group of nations, called rather euphemistically "British," would tend to give the United States rivals, rather than allies. Is the United States indifferent to this? We may see some reasons why they had best not be indifferent, and why they had best welcome an English-speaking confederation, for that is what "Imperial Federation" would come to.

That the Queen's son-in-law is quite ready to sacrifice the word "imperial," which has been a smoke in the eyes of the colonial democracies, and declare for "English-speaking," is a fact not without suggestiveness.

A NOVEL SITUATION REQUIRING A NOVEL SCHEME.

After describing the movement towards establishing an imperial *Kriegsverein*, the Marquis insists—

that any heavy increase in war power can only be arranged by conference. The first conference has been successful in this regard, and it will probably be followed by others. But there is no use in speaking of long forward steps to Americans or English until some necessity arises to make it patent to the people that they must devise some novelty. . . .

The idea of a Federal union between what are practically independent communities, separated from each other by wide oceans, is a new thing. Similar conditions have never prevailed in the history of the world. Never has a mother country produced so marvellous an array of colonies, chiefly consisting of people of her own blood, wholly adopting her own laws and rejoicing in her tongue, while at the same time insisting on a totally separate political frame for the picture which they delight to paint as English. The notion that they can be united for certain common purposes is natural.

ITS VALUE FOR AMERICAN HOME AND FOREIGN POLICY.

Would it not be for the United States' advantage that it should have the sympathy of a sound, strong English federation in any dispute with the outside foreigners? . . . A league of kindred states that would make maritime war difficult, nay almost impossible, might have an understanding with the United States, while America kept outside any engagement, and might thus insure the very neutrality which the United States would desire to keep and which might otherwise be endangered. As their own foreign element, Italian, or German, or French Canadian, gets stronger and more segregated in special spots in the Union, it is quite conceivable that race or national questions under some specious name may trouble them, and that the "national" population may love to hoist a tri-colour or some foreign flag in preference to the Stars and Stripes. The French in the north-east corner

might well form such a "national" cave of Adullam. Then how about the foreign elements in the South, half Congo and half Creole? Yes, these things may be out of sight for the present, but the present becomes the distant past very soon in politics, and an English "Bund" is not a bad antidote to certain schemes and dreams which are very un-English, using that adjective in its best sense.

It will be observed that the Marquis seems to prefer the words "state" and "inter-state" to "colony" and "inter-colonial." His paper illustrates the rule that the more British statesmen try to look at the future of our empire through American eyes, the less are they likely to suffer from insular or feudal myopia.

THE PROSPECTS OF DISARMAMENT.

FROM AMERICAN VIEWPOINTS.

THE downfall of militarism is proclaimed by two writers in the *American Journal of Politics* for October. The Hon. J. M. Beck finds in the "decent respect to the opinions of mankind," which was explicitly recognised in the Declaration of Independence, the germ of the world's peace. Tolstoi's "War and Peace," Lutner's "Ground Arms," Zola's "The Downfall," Verestschagin's "Battle of Plevna," suggest that the spirit of militarism is "losing its iron sway on the minds of men." Among considerations which inevitably tend to peace are "the spirit of democracy," facilities of intercommunication and consequent sense of brotherhood, and "the development of means of destruction" to a prohibitory pitch. A more novel suggestion is, that the competition of the United States for the markets of the world, will compel the European peoples to cast off the terrible load of taxation and unproductive labour, which now handicaps them so seriously in the commercial race.

ANGLO-AMERICAN ALLIANCE.

Next comes the hope—

not of an Anglo-American re-union, . . . but of an Anglo-American alliance in the interests of peace. They are the only two countries upon which the sun does not set, and which are beyond question unconquerable by any power that could be sent against them. Together they unite, without counting their colonial dependencies, an English-speaking nation numbering to-day over one hundred millions of people, and destined within fifty years to number two hundred millions. . . . These two are the greatest competitors for the world's industrial supremacy, and they will compel by their own comparative freedom from governmental burdens a like exemption on the part of other countries.

Mr. Beck's reference to Christianity as the principal ground of hope, leads him to mention the curious proposal made this year in Philadelphia, that the United States should summon—

a meeting of the human family in the city of Jerusalem, to give thanks and praise to God, the Father of all, and so appropriately celebrate the closing of the nineteenth and the opening of the twentieth century of the Christian era.

This he thinks should be the "first parliament of man."

"A WORLD'S SUPREME COURT."

A more vigorous peace policy is advocated by Mr. W. H. Jeffrey:—

President Cleveland should invite the nations of the world to appoint commissioners to meet at a given place to formulate plans for universal peace. This done, we would then have a general judiciary department of the world, by virtue of which would exist the grandest body of legal talent ever assembled on the face of the earth: the world's supreme court, composed of one associate justice from each nation, who should be chosen by the chief executive to serve for life. All international questions that could not be amicably settled by the various diplomatic corps, would here be heard and adjusted on the merits of the case and not by virtue of the might and power of the nation affected.

A MODERN UNIVERSITY FOUNDER.

WHAT CAME OF A BEREAVEMENT.

LELAND STANFORD was a railroad magnate and the wealthiest citizen of California. The story of his educational ideas, and how he came by them, is told by President D. S. Jordan in the *Educational Review* for September:—

The only child of Mr. and Mrs. Stanford, Leland Stanford, junior, died in 1881, at the age of sixteen years. Out of this bereavement came the resolution to devote their fortune to the cause of education. "Henceforth," said Mr. Stanford, "the children of California shall be our children." In the next seven years large preparations were made. The founders visited the principal educational establishments of Europe and America, and in 1891 the Leland Stanford Junior University at Palo Alto opened its doors to the young men and young women of all lands.

His "ideas" illustrate the result of fusing academic and democratic ideals:—

He believed that no educational system could be complete that did not form an unbroken ladder from the kindergarten to the highest university, a ladder that each one should be free to climb, so far as his ability or energy should be adequate. He wished that this sentence should be placed on all educational publications of the university: "A generous education should be the birthright of every man and woman in America." . . . It was arranged that . . . all lines of work included in the plan of the university will be equally fostered. This recognition of the absolute democracy of all knowledge is still almost unique in educational management. . . . Co-education and equal education of the sexes was to him an axiom. . . . "We have provided," he said, "in the articles of endowment that the education of the sexes shall be equal—deeming it of special importance that those who are to be the mothers of a future generation shall be fitted to mould and direct the infantile mind at its most critical period."

A SIAMESE PAGEANT.

MR. DAVID KER supplies *Chambers's Journal* with a very vivid picture of the birthday celebration of the King of Siam. This is his account of the great procession:—

Through the vast paved court-yard of the palace—above which its three successive roofs towered in one great blaze of green and gold—came, marching, to the music of a well-trained military band, a picked body of grenadiers in the uniform of the Siamese line—white frocks and sun-helmets, and blue trousers with a white stripe down the side. Then followed the scarlet jackets, and red horsehair plumes, and fine black horses of the cavalry of the Guard, succeeded by the Foot Guards in dark-blue coat, armed with English rifles. Behind these came the crew of the king's model yacht—about a score of bright young native sailor-lads, who looked very smart and "ship-shape" in their British man-o'-war jackets. To them succeeded—as my English host observed with a grin—a regiment of genuine *infantry*—that is, several dozen tiny Siamese children, dressed as Highland soldiers—to our no small surprise—in the gay tartan of the Clan Stewart, which set off their solemn little brown faces very picturesquely.

And now a fresh burst of music heralded the arrival of the native grandees, carried by white-robed slaves in carved chairs of ivory or inlaid wood, under the shade of huge many-coloured umbrellas, which reminded us of those that we had seen overshadowing the black royalties of West Africa. Then followed the king's brothers, beneath still larger umbrellas fringed with gold; and finally—with a swarm of richly-dressed attendants before and around him, carrying bundles of rattans across the palms of their outstretched hands—appeared the king himself, a slim, rather good-looking young man of thirty, accompanied by three of his children, among whom the four-year-old Crown Prince is conspicuous by the tiny crown of diamonds which encircles his little top-knot of fuzzy black hair. Altogether, it was a famous show.

THE WORK OF THE FOLK-LORE SOCIETY.

ITS PROGRAMME AND ORGANISATION.

Folk-Lore recently published the annual address by the President, Mr. G. L. Gomme, together with the fifteenth annual report of the Council. Mr. Gomme, speaking of the programme of the society, says:—

THE PROGRAMME OF THE SOCIETY.

We are steadily sweeping the counties, one by one, and collecting into our pigeon-holes and into our printed material all that has been gathered by those good old people called antiquaries, who noted facts for their own sake, and left meanings and definitions alone. We should re-arrange all these items of folk-lore in proper scientific order, and write the biography of each specific item, whether it be custom, belief, superstition, or myth. This seems to me to be the true policy of the future, and, if we have it steadily before us, I doubt not that we should find sufficient workers to co-operate loyally in effecting each year something towards completing it. I know it will not be done except by many years of hard work and efficient organisation, continued without a break year after year.

HOW TO CONSTITUTE COUNTY COMMITTEES.

I extract from the report of the society the following suggested rules for the local committees which may be formed in the various counties:—

I. That the Committee be called the Local Committee for Folk-lore.

II. That the Committee be invited to attach itself to the Folk-lore Society as a member.

III. That all items of Folk-lore from printed sources, such as Chronicles, Local Histories, Newspapers, Notes and Queries, and Archaeological Publications, be copied out by the Local Committee, to be printed by the Folk-lore Society.

IV. That the current Folk-lore of the county be collected orally, to include (a) Folk Tales and Nursery Tales; (b) Hero Tales; (c) Traditional Ballads and Songs; (d) Place Legends and Traditions; (e) Fairy Lore and Goblin-dom; (f) Witchcraft and Charms; (g) Folk Medicine; (h) Superstitions; (i) Local Customs; (j) Festival Customs; (k) Ceremonial Customs; (l) Games; (m) Jingles, Nursery Rhymes, Riddles, etc.; (n) Proverbs; (o) Old Saws—rhymed and unrhymed; (p) Nicknames, Place Names, and Sayings; (q) War Cries; (r) Folk Etymology.

V. That each item, whether from printed or oral sources, be clearly written on one side only of a separate slip of paper, with a full reference to the authority, (a) when derived from a printed source, the title, author's name, date, and pages of reference, and (b) in the case of items collected orally, a note of the name, age, occupation, and sex of the narrator, and of the locality to which the item relates.

VI. That a list be drawn up of Folk-lore objects in all the Museums and Private Collections in the county, such as Amulets, Feasten Cakes, Harvest Trophies, Objects left at Holy Wells, Specimens of Mummification and other Costumes, etc.

VII. That in the event of any question or difficulty arising in carrying out the work of the Local Committee, the Secretary of the Committee communicate with the Secretary of the Folk-lore Society.

From the published list of the Secretaries of the existing Committees it would seem that Committees have still to be formed in many of the counties of England and Scotland. Any of my readers who wish to assist in this excellent work are requested to communicate with the Secretary, Mr. F. A. Milne, 11, Old Square, Lincoln's Inn.

THE REVIEWS REVIEWED.

THE FORTNIGHTLY REVIEW

Two articles which will probably leave a more than passing mark on the political consciousness of the time, convey distinction to the November number of the *Fortnightly Review*. These are fittingly the last and the first:—"The Ireland of To-day," by X., and "To your Tents, O Israel," by the Fabian Society; and are noticed elsewhere. So is Mr. Robert Wallace's "Psychology of Labour and Capital." The general tendency of the Reviews to give more and more space to the discussion of social economics is illustrated by the fact that no less than five out of the ten articles found here deal with subjects chiefly of that class. Mr. William Smart inquires:—"Is money a mere commodity?" and answers that it is better termed "third commodity." He urges that the money of all communicating countries should be assimilated and become "the universal commodity." He advises to this end an international agreement to continue the use of silver at fixed ratio with gold.

THE COAL WAR AND THE ECONOMISTS.

Mr. Vaughan Nash treats of "The Lock-out in the Coal Trade," in thorough-going sympathy with the men. He will not leave the masters a leg to stand upon. He estimates "the greater part of the Federation men do not average more than from sixteen to eighteen shillings a week," and remarks:—

It is curious to find how the educated classes, who have established a minimum wage in their own professions, have almost with one consent denounced the miner for his attempt to place his calling of coal-getting upon a professional basis. . . . However the world may sneer, the lock-out has established the living wage as an industrial principle, and has thus set a low-water mark for the reward of miners just as the great strike of 1889 did for the dockers.

This is a very pertinent inquiry:—

It would be interesting to know why the economists have remained so silent during the last three months. . . . It is surely a loss to the world that the specialists in economic science do not issue authorised versions of their views at such times as these as a check upon the irresponsible use of their science made by the newspapers.

Mr. Nash thinks that the Labour Department will have to register the actual wages paid in the great trades.

"HOW TO SAVE EGYPT."

This is the title of a paper which Mr. Cope Whitehouse has written in view of the meeting in Cairo next February of an International Commission of Engineers to consider means of increasing the supply of water during the three months of low Nile. Mr. Whitehouse adversely criticises rival schemes, and argues for the scheme identified with his name for diverting a portion of the flood into a great natural depression west of the Nile, known as the Wadi Haiyan:—

This lake with a surface larger than the Lake of Geneva, filled with pure water from the flood to a depth of 250 feet, connected with the river and canal system of the Delta, would return through its sluice-gates more water than the entire minimum discharge of the Nile through the cataract at Assuan. The cultivator of Upper Egypt would be free to take what he required from the river itself. The amount thus abstracted would be made good from the bountiful stream issuing from the reservoir-canal seventy miles south of Cairo.

WHAT MR. RUDYARD KIPLING HAS DONE.

A critical article by the late Mr. Francis Adams on "Mr. Rudyard Kipling's Verse" contains the following appreciation:—

His vogue was the most universal one of our time. His popular limitations were plentiful enough, his cheap effects were glaring enough to win him the applause of the intellectual groundlings, the noisy imperious "pit" of our contemporary theatre of art. Yet his achievement was so real and striking, his contribution to literature was so undeniable that no one possessed of candour and intelligence could refuse to take him seriously. He had revealed to us, if partially and askew, still with singular power and vividness, what Anglo-India meant—what the life of the Anglo-Indian civil servant and soldier meant, and he had lifted the short story, as an expression of thought and emotion, a whole plane higher than he had found it.

OTHER ARTICLES.

Mr. A. R. Wallace contributes the first part of a popular description of "The Ice Age and Its Work" in which he advances against Sir H. Howorth's "Glacial Nightmare" "the converging evidence demonstrating the existence of enormous ice-sheets in the northern hemisphere." Professor Thorpe gives an account of the Swedish chemist, Carl Wilhelm Scheele (died 1786), whom he characterises as "the greatest chemical discoverer of his age."

THE NINETEENTH CENTURY.

The contents of the November issue are admirably varied, the topics in the main stand widely apart from each other, the roll of writers is largely made up of distinguished names, there is much excellent reading matter, but except Sir Lepel Griffin's "England and France in Asia," there is perhaps no article of very high importance. To the matter of Mr. John Redmond's "What Next?" attaches some political moment; but the article does little more than reproduce the gist of his recent speeches in Ireland. "The reconsideration of the Home Rule Bill, or the Dissolution of Parliament in the year 1894," is the alternative on which Mr. Redmond pledges his party to insist.

THE SPECTRE OF FOREIGN COAL.

"The Coal Crisis and the paralysis of British Industry," is the title of a very dejected article by Mr. J. S. Jeans. It offers a diagnosis without prescribing a remedy. The miner is increasingly restless and turbulent. He is not much of a political economist. He yearns to bring back the "rosy times" of the 1873 coal famine; and thinks he can do it by stopping work.

The four most serious and ruinous struggles of the kind within recent years have been those of the miners of Scotland, Northumberland, Durham, and the Midlands, the one almost directly following upon the heels of the others, and all of them involving the most disastrous losses; but not one out of the lot has fully secured the purpose for which it was undertaken.

They have, however, helped to alienate trade and give the foreigner access to new markets. When he comes to treat of practical conclusions, Mr. Jeans has only negative criticism to offer. The sliding scale will not do. Sir George Elliott's trust will not do. The nationalisation of coal will not do. The last word is a suggestion that German or even American coal may some day compete successfully with British coal in our own land.

WHY MAN DOES NOT SWIM BY NATURE.

Quadrupeds swim by instinct, why must man *learn* to swim? This is an inquiry propounded by Dr. Louis Robinson. He remarks that quadrupeds use their limbs in the water precisely as they do when running on the land. A drowning man, however, "acts exactly as if he were endeavouring to climb." These are his instinctive movements. With this fact Dr. Robinson compares the instinctive flight up a tree of the frightened monkey, and entitles his essay, "Darwinism and Swimming: A Theory."

OTHER ARTICLES.

Mr. Lyulph Stanley complains that the London School Board has not provided the needed school accommodation, or sufficiently staffed existing schools, or developed evening schools, or appreciably supplied the required Higher Grade schools. It has been spending its time instead in a profitless theological wrangle. Mr. Diggle is said to have at last succumbed to Mr. Athelstan Riley, and the dangers of the new policy are expounded.

St. George Mivart argues that the two most striking and essential differences between "Roman paganism and Christianity" were the possession by the Christian Church of (1) catholicity and (2) authority. Both centred in the Church at Rome then: and centre now. Wherefore he and his fellow-believers rejoice in "the unspeakable privilege of being *Roman Catholics*." Rev. W. E. Dickson, precentor of Ely, condemns "our disastrous cathedral system" in three points—(1) the rotatory residence of canons; (2) the anomalous position of the bishop; (3) the absence of pastoral relations. He would unite the offices of bishop and dean, attach a parish to the cathedral, and have four or more canons, who would practically act as curates to the dean-bishop.

Mr. Swinburne concludes his appreciation of Victor Hugo's poetry. Mr. William Graham charmingly describes his "Chats with Jane Clermont"—of Shelley and Byron fame—in her old age. Lord de Tabley contributes a poem of ten pages on "Orpheus in Hades." Mr. Provand's "Employers' Liability," and Mr. W. B. Scoone's "Selection of Army Officers," claim mention elsewhere.

THE NEW REVIEW.

THE articles this month are of a rather slighter kind than usual. The volley of protest against "The Advertisment Nuisance," Mr. Bolton King's "Parish Councils and Allotments," and Rev. J. W. Horsley's exposure of "Our Sporting Zadkiels" are noticed elsewhere. Sadik Effendi controverts Mr. Stevenson's statement of the Armenian situation, describes Mrs. Bishop's testimony as a work of fiction, and extols the general virtues of the Turkish rule.

HONEST MACMAHON.

Mr. Albert D. Vandam in his portraiture of the late Marshal, quotes and endorses a saying of the late Mr. Pelletan:—

"Without the least ambition, without the slightest will of his own, without the faintest prestige," said Pelletan. The words sum up the whole of MacMahon's character better than a hundred pages of psychological analysis could have done. "What is the use of asking us for particulars of MacMahon's career?" wrote a journalist despairingly after Solferino.

"What is the use of asking us, when MacMahon himself refuses to enlighten us on that point, and simply says that he has done exactly what every other general has done and would do under similar circumstances?"

With the antitheses Mr. Vandam sums up:—

Marie-Patrice de MacMahon was a rare and curious specimen of the happy man *sans le vouloir* and *sans le savoir*. He was a more or less overt, but constant opponent of the Empire; the Emperor . . . loaded him with honours and distinctions . . . Marshal MacMahon was the very opposite of a politician in the Republican acceptance of the word; the Republicans invested him with the highest political office they had to bestow. Though a Legitimist at heart, he failed to do the Legitimists bidding at the most critical moment. And yet the Legitimists hold his name in the greatest respect. And the reason of all this? Simply because he was an honest man.

"THE VOICE OF THE ENGLISH PEASANT."

Mr. Leslie Stephen concludes his study on William Cobbett, whom he thus characterises:—

Cobbett is simply the voice of the English peasant. He is the translation into sturdy vernacular of the dumb unreasoning sentiments of the class which was then most cruelly suffering from causes only half intelligible, though their effects were painfully manifest. He is the cry of blind anger, indignation, and remonstrance rising from the social stratum which, being the weakest, was being most crushed and degraded in the gigantic struggle of the revolutionary wars.

A SOCIAL IDEALIST.

Miss Lanoë Falconer, author of "Mdlle. Ixe," writes a short tale to plead the cause of the overworked wife and mother. "An Idealist" is horrified by the change he sees in a beautiful girl after a year's married life, and declaims against the working men who are always shouting against overtime and underpay, while—look at the poor drudges in their homes behind them! "A man's work is from sun to sun, but a woman's work is never done." And not work merely, however hard. Ill-health, torture, and risk of life—year after year, perhaps—all thrown into the bargain, and paid with the same wages—which are barely thanks.

He had been electrified by the ascetic spirituality of a sermon of his pastor's; but never crossed the chapel doors again, after learning that the pastor's fourteenth child was born that very night. He goes to a new brotherhood, to be deeply impressed by the social idealism of a speaker, only to find out afterwards that the eloquent exponent of the rights of man was husband to the sadly broken-down girl.

OTHER ARTICLES.

Professor Ferrero sets out to explain woman's inferiority in art by observing that "Aesthetic taste is first and earliest displayed in the male, even among the lower animals." The primary cause of the inferiority "seems to lie in the sensual coldness of women as compared with men. The very germ of art is love." The second cause is her lack of the synthetic faculty of man. Her muscular sensations also are less intense. Meant to be nurse in the battle of life, she cannot properly depict its sterner and wilder episodes. She can, he allows, appreciate and invent "mere prettiness," and may even surpass man in the imitative arts, in personal adornment, and in conversation.

Professor Jebb's "defence of classical study" is that never did classical study less need defence:—

It may fairly be said that classical studies are now, on the whole, more efficient in this country than they ever were; they are at many points deeper; they are more comprehensive; and they are more in touch with the literary and artistic interests of the day.

Mr. S. J. Viccars bewails the little provision or endeavour made to secure a proper representation of "British Art in the National Gallery."

THE CONTEMPORARY REVIEW.

THE November number is above the average. Its articles are shorter and more numerous, and most of them actually hit the hour. The articles by Mr. Sydney Olivier "The Minors' Battle and After," by Mr. J. T. Bent on Mashonaland and its People," by Mr. J. F. Hogan on The Conference of Colonial Members," and by Rev. J. F. Wilkinson on "The English Poor Law and Old Age," aim notice elsewhere.

A FRENCH VIEW OF FRENCH POLICY.

Mr. Gabriel Monod leads off with an enlightening survey of "the political situation in France." He does not fear much from the group of fifty Socialist deputies; the party in France is not very formidable. If they wish it the Moderate Republicans may be masters of the situation." The great want is the want of a leader. MM. e Freycinet, Rouvier, Ribot, Bourgeois, Constans, are in turn discussed as possible leaders and dismissed as discredited. M. Casimir Périer might do, but he is said to be reserving himself for the Presidency. The foreign policy now generally in favour "consists in strengthening the Russian alliance more and more, and remaining on terms as cordial as possible with England and the United States." M. Monod exposes one of the weakest points of the Franco-Russian alliance when he says—

War is always at hand, in the present state of Europe, but nobody would dare to engage in it deliberately. The chances are too great. France must perish if she engages in an unsuccessful one; and a victorious war, in which Germany was crushed by France and Russia, would result in the subjection of all Europe to the latter. . . . What a mockery if after the victory, France were obliged to seek an alliance with Germany!

Monod questions whether a ministry endeavouring to bring about a war for the recovery of Alsace and Lorraine by Russian aid could count on a majority to back them. He deplores France's love of "stir and pageantry," "glitter and hustle," yet acknowledges also a longing for something "nobler and greater." The younger generation shows tendencies towards religious mysticism and theosophy.

The great danger of our position . . . is the existence of a state of inaction, of languid *ennui*, side by side with the longing for activity; an intellectual and moral chaos from which may spring some sudden outburst—it may be war, it may be social revolution, it may be a pacific, moral and intellectual revival.

WHO SHALL HAVE SIAM?

Mr. Henry Norman, claiming that his predictions of four months ago about Siam were exactly fulfilled, proceeds to prophesy once more. His paper, "Urgency in Siam," may be thus summarised:—

Nothing more in the way of reform, development, or defence is to be hoped for from Siam. The French in Siam have carefully arranged matters so that further interference and extension on their part will soon be provoked. They are openly expressing an intention to protect or annex the whole of Siam. The mission of Prince Swasti brings matters to a crisis. He comes as special envoy to get the best terms he can for Siam from England and France, or one of them. Ultimately—and before very long—the valley of the Menam must come under the dominion of England or of France. Which shall it be? That is the question the British public has to decide.

Only let it decide one way or other, urges Mr. Norman, not drift.

BISHOP OF RIPON ON PARISH COUNCILS.

After recounting at length what some say for, and others against, the Parish Councils Bill, the Bishop of Ripon "on the whole" looks forward with hope to its operation; but, as is usual in Anglican criticism of the measure, he stipulates that the parish rooms and

school charities of the Church be explicitly exempted from the scope of the Bill. He makes two suggestions, which show courageous initiative. The administration of parish doles might, he allows, be reformed, but he questions the wisdom of transferring them to the Parish Council.

Surely these charities might be better employed. Might not, for example, a scheme be devised by which, without doing injustice to localities, the much-to-be-declared pensions for old age might be promoted? If some common administrative power could be exercised over all these charities, money which is now too often given in an uncertain, incomplete, and unsatisfactory fashion, might be utilised for the substantial advantage of those who have grown too old for work.

The second suggestion is an appeal to unoccupied city residents of independent means to migrate to the villages to assist in "the refounding of English life."

Their presence would not only arrest the flow of population from the country, but might even attract back from the fatal vortex of town life many who now go. . . . In the difficult days of the formation and first working of these Parish Councils, they might render untold service.

WANTED, A NEW SCIENCE OF MARRIAGE.

"The Problem of the Family in the United States" is treated by Rev. S. W. Dike, LL.D., who describes the divorce reform movement of the last fifteen years. He pleads for what is practically a new ethical science of marriage and of the family,—a need which has transpired in the discussions of divorce and in the general reaction from individualism consequent on the war. He seems to suggest that Prof. Bryce should take in hand the construction of such a science. He does not advocate the passing of a national law of marriage as an amendment to the Federal Constitution, for government returns have shown that the variety of State laws has not tempted migration with a view to divorce: eighty per cent. of the divorces during twenty years having been in the same States as were the marriages.

OTHER ARTICLES.

Mr. Francis Peek interposes as an Anglican layman in the controversy between Archdeacon Farrar and Canon Knox Little, to request from the latter proof, and especially Biblical proof, of his sacerdotal and sacramental theories. He wonders that those who do and those who don't accept the Real Presence can remain in the same Church. Rev. George Washburn, D.D., contributes the paper he read at the Chicago Parliament of Religions, on "Christianity and Mohammedanism." Mr. A. J. Jukes Browne describes the geographical evolution of the North Sea.

The Church Quarterly Review.

THE *Church Quarterly Review* shows the courage of its catholicity by selecting non-Anglican works for notice in its most prominent pages. After the first article, which, as has been shown elsewhere, deals with the project of rate-aid for Church schools, the "Apologetics" of the Presbyterian Dr. A. B. Bruce, "The Place of Christ in Modern Theology" of the Congregational Dr. Fairbairn, "W. G. Ward and the Catholic Revival," by his son, Wilfrid Ward, and Mr. Herbert Spencer's "Ethics," come in for lengthy treatment, not by any means wholly unsympathetic, descriptive rather than critical. Of the last-named work the reviewer concludes "that Mr. Spencer's attempt to bring ethics within the limits of natural science by the application of the principles of evolution has failed—absolutely, completely, and undeniably," and contrasts the loud pretensions of the evolutionary school as it set out to explain the higher sides of human nature with Mr. Spencer's modest dissatisfaction at his results.

THE NATIONAL REVIEW.

THE November number is bright and readable, with several solid articles. Mr. Alfred Austin adds part second to the beautiful mingling of prose and poetry which he has entitled: "The Garden that I Love." Mr. Alfred Lyttelton's paper in the October number, in which he questioned the claim of golf to be reckoned as a first class game, has roused the wrath of the devotees of the golf cult. Mr. T. Mackay replies in an article headed "Golf—the Monstrous Regiment of the Englishry," takes up Mr. Lyttelton's arguments *seriatim*, and thunders in fine stage fury at the audacity of the ill-informed Southron. Even Mr. Balfour has felt moved to write, and in the same humorous vein of simulated indignation.

WHAT WE OUGHT TO DO IN SOUTH AFRICA.

Mr. William Gresswell treats of "South African policy," and laments that we have had none.

No British Ministry has ever had the courage to lay down a policy worthy of the idea of an Imperial South Africa. No political party in Great Britain has dreamed of a policy for South Africa, so sentimentalists may as well hold their tongues. Great Britain has long since abrogated her position as a direct and supreme governing power in South Africa.

But, "meantime, Colonial South Africa has raised its head." Therefore,—

as the task of self-government and the management of their concerns in every department of civil government has been long since handed over to the South African Colonists, is it not just and right to leave them the absolute control of their military department, and of their war expeditions?

PARISH COUNCILS.

Rev. T. W. Fowle writes to claim the Parish Councils Bill as his own offspring—with some alterations which he severely criticises. The name is wrong: it should be Village Councils. The parish meeting is "nothing more than a reversion to a lower political type;" trivial but mischievous. The grouping of the smaller parishes is warmly condemned. So is the abolition of the *ex-officio* Guardians. Mr. John S. Montague, M.P., asks for amendment of "the clauses which seem to bear unjustly on our National Church," and thinks that "if this Bill has some bad points, it has more good ones."

IS INDIA DISLOYAL?

A gloomy view of the Hindu attitude to the British Government and of the Hindu situation in general is set forth in Mr. H. E. M. James' "Reflections on the Way Home." He testifies to the "disloyalty," the strong dislike of our Government displayed by the free native press, and by the inferior class of educated natives. The native press is manned by the failures at the Universities, and their persistent misrepresentation of British conduct is telling on the popular mind. Our courses of study have helped to turn out men who are philosophical Radicals, and devoted to the glorification of liberty. Mr. James dubs the National Congress an "annual debating Society," the common ground of which is religion, and the common object hostility to the British. The Cow riots have been caused by a revival of Hindu religion, which has made the Hindu more self-assertive and intolerant of Moslem sacrifice. Mr. James sees nothing for it but to go on as we are going, only fostering technical more than higher education. But always "keep the executive power in the hands of the British officers."

"MENDING" THE LORDS.

None seems so eager now to reform the Upper House as the Conservatives, if we may judge from their magazines. Here is the *National Review* discussing these alternatives,—

One plan would be to make the former consist of not more than one hundred and fifty members chosen by constituencies four times as big as those which elect the House of Commons, but a stronger Senate could probably be formed through the medium of the county councils, each of which might contribute two members. Such an Upper House should be elected every seven years, but never dissolved.

But the "trend of the Constitution" is declared to be in the direction of the Referendum, to be applied by the Lords.

Admiral Maxse's "European Outlook" is noticed elsewhere. The other articles do not call for special remark.

BARON FERDINAND VON WITZLEBEN AND HIS REVIEW.

BARON FERDINAND VON WITZLEBEN, who edits the *Internationale Revue über die Gesamten Armeen und Flotten*, was born at Berlin in 1833. A member of the ancient family of Witzleben, he followed the unbroken

BARON FERDINAND VON WITZLEBEN.

custom that devoted its sons to the military service. Owing to a wound, he was obliged to send in his resignation, and he then undertook the management of two country estates for his father. He married in 1863, and in the same year brought his name into public notice by his literary productions. The subjects that formed the field for his first efforts consisted of novels, scientific essays, and occasional attempts in the direction of the drama, in which latter domain of literature

more than one work has been produced at Dresden. The happy vein of literary talent possessed by his grandfather—who, under the adopted name of Tromlitz, enjoyed much success in his writings towards the middle of this century—seems to have cast its mantle upon the grandson. After serving as a volunteer in the campaign of 1870–1 the Baron at last yielded to the pressure of a number of Army friends that he should undertake the editorship of a large military periodical, and in 1882 he brought out the *Internationale Revue*. In every respect he justified the expectations of many distinguished acquaintances—amongst others, his godfather, the late Count von Moltke—by creating for his journal a high and widely extended reputation in the plain of military literature.

After the sale of his estates, twenty years ago, Baron von Witzleben settled in Dresden, and although visited by severe illnesses, he has never failed to devote his whole energy to his Review, which is now in its twelfth year. Among the circle of his friends he is known as an amiable and bright figure, who is always sure of a hearty welcome. Towards his colleagues he is in every respect a warm and true friend, and he has the reputation of doing many a kind action in an unostentatious way. He has resigned all his posts of a public nature, amongst others that of the Presidency of the Dresden Press Society, in order to devote his entire forces to the work he has created.

THE REVUE DES DEUX MONDES.

THE most interesting articles in the *Revue des Deux Mondes* of October 1 deal with France during the seventeenth and eighteenth centuries. M. Hanotaux contributes a curious chapter to French history in his account of Richelieu at the Parliament of 1614, a Parliament presided over by Marie de Medicis, and composed of two hundred representatives of the people, with an Upper House composed of the nobility. This seems to have been practically Richelieu's first experience in public; and it was probably on this occasion that he produced an impression on the Queen Regent and the young King, whose counsellor and *alter ego* he finally became.

The next article is by M. Berthelot, and is a continuation of his account of the ancient and mediæval chemistry. The Arab nation seems to have had a special interest in the science, but the Arab chemist added to his other labours that of being a magician and astrologer.

M. Du Bled continues and concludes an exhaustive history of Franche Comté, and gives a curious account of the salines and hardware industries which make this department one of the wealthiest portions of France. He gives an excellent character to the Franc Comtois, whom he declares are a persevering, intelligent, and witty race.

"WHY DO WE BLUSH?"

The subject of blushing seems to have a strange fascination for some people, and in "Why do we blush?" M. Melinaud attempts to explain the matter from a psychological point of view. He declares that modesty, humility, timidity, anger are the four principal causes of blushing. In each case he points out the emotions are strongly aroused in the presence of others, for few people blush when they are by themselves. Taking the case of lovers, he puts forward a theory which will scarce meet with universal credence, namely, that once their sentiments are declared, they do not blush before one another. Again, small children never blush; but Darwin in his "Expression of the Emotions" mentions two little girls aged two and three respectively, who blushed when scolded, but he cited them as rare exceptions. Young men and youths blush more frequently than when they are older. M. Melinaud sums up his article by declaring that blushing is a useless and dangerous luxury. Those who are afflicted with the habit of constantly blushing at the wrong time will agree with him.

The same number contains an exhaustive review by M. Marmée of the memoirs of General Baron Thiebault, covering the period between 1769 and 1795. Baron Thiebault, who was afterwards destined to become one of Napoleon the First's most valued Generals, was actually born at Berlin at the Court of Frederick II., and spent there most of his early youth. In a passage of the Memoirs quoted by the author of the article, Thiebault gives a curious picture of the young Napoleon, already General Bonaparte, when he was twenty-six years of age: "Slight, small in figure, his toilet always disordered, his long hair hanging on his shoulders, and even at that time his shabby clothing revealing his poverty; yet in spite of it all he was already beginning unconsciously to lift himself towards a level where none could follow him. Firstly, all were astonished at his activity; he seemed to be everywhere at once, or rather, lost to sight one moment, he would reappear at the next

at a distant spot. He was even then strikingly laconic, clear, and accurate, but imperious in manner."

The first volume of General Thiebault's Memoirs will shortly be issued in Paris, but it is from the manuscript copy that M. Marmée has compiled his interesting article.

The second number of the *Revue des Deux Mondes* gives the place of honour to M. Desjardins' article on "How Russia took her Place in Europe," noticed elsewhere.

LACORDAIRE.

The Comte d'Haussonville, describing "Three Moments of Lacordaire's Life," recounts the relations existing between the Church and State in 1830, 1848, and 1858. Lacordaire, says M. d'Haussonville, was even when quite a young man more Liberal than Royalist. Seeing no opening in France, he made up his mind to go to America to seek, in his own words, liberty of thought and action in Washington's country. His trunks were packed, and he had already said good-bye to his family, when he received from his friend the Abbé Gerbet a letter, asking him to join with Lamennais in the foundation of a Liberal Catholic newspaper. This appeal changed the whole current of the young priest's thoughts, and he decided to remain in France. Shortly after, he met Montalembert, who was destined to become the David to his Jonathan. M. d'Haussonville considers the second most important moment in Lacordaire's life to have been in 1848; for he stood for, and was elected to be, a member of the New Parliament. The new régime disappointed him, for the noble Liberal religious Utopia of which he had dreamed was conspicuous by its absence.

Yet, as was natural, he felt deeply the *coup d'état* and the recognition of the Third Empire by the Catholic Church, and the last time he ever preached in Paris was one long inspired enunciation of Napoleon the First anent the latter's treatment of Pius the Seventh. The Imperial authorities, wise in their generation, took no notice of the great preacher's utterances, and the great and more influential journals were instructed to praise the sermon.

"CAVOUR'S RIGHT HAND."

Under the title "An Italian Statesman," is told in a few interesting pages the political career of a man who was at one time Italian ambassador to Paris, twice Prime Minister, thirty years member of Parliament, and ten years Syndic of Florence. Born in 1822, Ubaldino Peruzzi came of well-known Florentine stock, some of his ancestors having been mentioned in Dante's "Paradiso," and many globe-trotters will remember the Peruzzi Chapel in the church of Santa Croce, celebrated for its exquisite Giotto frescoes. Peruzzi laboured late and early at the unification of Italy, and was Cavour's friend and right hand. It was whilst Minister of Public Works and the third Cavour Cabinet that he planned the construction of the Adriatic railways which formed for many years the only link between northern and southern Italy; but though he was always ready to go wherever duty called him, his heart was in Florence, and the great financial difficulties which overwhelmed his native city not only nearly ruined him, but were the lasting grief of his life. But during his later years old sorrows were forgotten, and he lived honoured and beloved in his beautiful palace at Antella, a few miles out of Florence.

M. Deherin, of the Academy of Sciences, contributes a learned article on the drought of 1893, and its results on French agriculture.

THE NOUVELLE REVUE.

THE October numbers of the *Nouvelle Revue* are distinguished by a large proportion of good articles. M. Behrs concludes his description of Tolstoi's family life, and M. de Gorlof begins and concludes a curious account of the origin of the Black Sea Fleet, which may be said to have owed its being in the first instance to Peter the Great. Even as a lad Peter had made up his mind to assist in forming a Russian fleet, and his first man-of-war, boasting of thirty-two cannons, was bought in Holland, and from thence taken to Moscow by rivers, canals, and finally by overland route. Nothing daunted by endless difficulties, the Tzar himself actively assisted in erecting dockyards on the Don.

In the same number the Duchess of FitzJames describes the bull-fights which now take place in the Roman arena at Nîmes. This lady believes that it would be comparatively easy to organise bull-fights which should not in any way provoke the righteous anger of the Society for the Protection of Animals. An attempt was made some time ago to organise bull-fighting in Paris, but the Parisians did not take kindly to this form of sport. At Nîmes, on the other hand, some of the feeling of the ancient Romans seems to have remained in the population, and most Sundays in the year thousands of Southerners troop into Nîmes and fill the vast arena, which holds with ease fifteen thousand spectators. The Duchess FitzJames is of opinion that all French bull-fighting ought to be restricted to these and similar places, and banished from the fairs, where she declares atrocious butcheries take place owing to the animals being of an inferior quality and the toreadors rough untrained men.

M. Delacroix continues his history of "The Witchcraft Trials of the Seventeenth Century," and quotes, as in previous articles, an enormous number of cases of supposed "demoniacal possession," giving extracts from the leading witchcraft trials of the time. Sorcerers were credited with unlimited powers, especially that of being able to turn themselves at will into a wolf, a fox, a cat, or a dog; they were also supposed to be able to command the wind and the rain, and to dispose of the fortune, life, and health of those round them. As M. Delacroix has already pointed out in previous articles, the strangest thing about these stories consists in the fact that such a number of witches and sorcerers gave themselves up, and made long and elaborate confessions of being all they were accused of being. As these avowals invariably led to the stake or the scaffold, it is impossible to realise why these unfortunate people should have pleaded guilty to the fantastic crimes with which they were charged.

As is but natural, the second number of the *Nouvelle Revue* also devotes a great deal of space to Russia and things Russian, beginning with a long extract from an unpublished memoir of the Duc de Richelieu, who was from 1815 to 1818 French Minister of Foreign Affairs; and then again, during the year 1820-21, when a cabal was formed against him owing to "his devotion to the Emperor of Russia, Alexander the First." In this passage of his memoirs the Duc explains and justifies his affection for Russia by declaring that the Tzar really prevented the practical partition of France when the Allies were considering, after Waterloo, the best course to pursue. "I am in possession of a map," says the Duc, "from which I shall never separate myself; it was given me by the Emperor Alexander after the Treaty had been signed on November the 23th. On this map is traced the line of the provinces which were about to be taken from us, that is to say, the greater part of Franche Comté, the whole of Alsace and Lorraine, Stenay, Sedan,

Mexieres, Givet, and the whole of French Flanders to the sea." And he then continues, in curiously prophetic words, to describe the great advantages of a Franco-Russian alliance.

In the same number M. Fournier de Flaix contributes a vivid account of Constantinople of to-day: his description of the cemeteries being especially curious. "Constantinople," he says, "is literally wrapped round by graveyards: in no other city do the dead take up so much room. A Turkish cemetery is neither enclosed nor cared for, but gives the idea of a public garden open to all. There are no monuments, no death registers are kept, and the very undertakers are conspicuous by their absence.

THE QUARTERLY REVIEW.

THE death of Sir William Smith, who had held the post of editor since 1867, and who died while the current issue was passing through the press, is appropriately noticed in two prefatory pages of the *Review*. It is stated that during his twenty-seven years of active editorship he "had no serious difference with any contributor." The present number is not unworthy of his editorial record. The important articles on "Chicago," "The Command of the Sea," and "Coalitions," find notice elsewhere.

PROGRAMME OF HOSPITAL REFORM.

A good paper on "The Modern Hospital" is introduced with the remark, "It is probable that to England the most lasting bequest received from the Crimean War has been the development of scientific nursing." It appears that the hospital is a much older institution than is generally supposed. It was foreshadowed in ancient Egypt and India; and Asoka of Gujerat, in the third century B.C., established hospitals in all his dominions. Destroyed and forgotten in the barbarian conquests, they were begun anew under Christian initiative. Henry VIII. is described as having established the modern hospital by the simple process of confiscating the old hospital endowments, thus making it dependent on voluntary contributions. The reviewer's suggestions of reform may be thus summarised:—

No new hospital to be started without a legal licence granted only on need shown. A uniform system of keeping accounts like that recommended by the London Hospital Sunday Fund: and central bureau for all accounts, to enable comparison and to promote economy.

A more careful inquiry into the means of all applicants, especially of out-patients. Provident dispensaries and per-hospitals for those who can pay. Poor law infirmaries to take over chronic and unsuitable cases from voluntary hospitals. Annual inspection of every hospital, its food, sanitation, &c.

THE LORDS' DILEMMA.

The title of "the dishonoured Bill" sufficiently indicates the style in which the Home Rule debates are reviewed. The working classes have, we are told, an instinctive distrust of the capitalistic Commons and a sort of good-humoured liking for the Lords. Discussing the future tactics of Mr. Gladstone, the reviewer regretfully foresees that—

The Lords will (to put it plainly) be placed in the dilemma of either having to pass Bills whose enactment would strengthen the hold of the Liberal party on the constituencies at the next election, or of throwing out these Bills and thereby causing their rejection of the Home Rule Bill to be attributed, not to any conscientious disapproval of the particular measure, but to a general dislike of all popular reforms.

THE EDINBURGH REVIEW.

BIOGRAPHY, geology, and politics divide between them the honours of the *Edinburgh Review*. The articles on "The Reform of the House of Lords" and on "W. G. Ward and the Catholic Revival" are noticed elsewhere. The parliamentary situation is reviewed in an article entitled "Party Manceuvres versus Public Opinion," in which of course the majority in the House of Commons stands for "party manceuvres" and the majority in the House of Lords for "public opinion." An immediate dissolution is demanded as the clearly constitutional course. The memoirs of General Rochechouart, which embody

the recollections of a man who experienced some of the horrors of the Revolution; who was aide-de-camp successively of the Duc de Richelieu, the celebrated governor of Odessa and governor-general of New Russia, and of the Emperor Alexander; who fought against the Turks and the Circassians; who took part as a Russian officer in the campaigns against the French in 1812-13-14; and under whose direction and superintendence Marshal Ney was executed; who also kept a journal since he was twelve years old, are vividly summarised.

Lady Burton's Life of her husband elicits a criticism which, deservedly enough, compliments the wife at the expense of the biographer. The reviewer thus sums up Sir Richard:—

He was a man with many faults—faults of education, faults of temper, faults of character; he had many and bitter enemies, and much evil was spoken of him, often undeservedly; but he had many and rare talents, and the man to whom children ran, the man who won the devoted love of a good woman, cannot have been altogether bad.

THE UNIVERSALITY OF THE FLOOD A SCIENTIFIC REALITY.

Of the very unstable equilibrium of geological theories we are reminded by an instructive review of Sir Henry Howorth's "The Glacial Nightmare and the Flood." The problem suggested by the mammoth remains found frozen and perfect in Siberia cannot, the author maintains, be solved except by granting the occurrence of a sudden catastrophe of a kind uniformitarians refuse to believe:—

The theory of continental glaciers, indeed, leaves his hands badly damaged. No dispassionate inquirer, after duly weighing his criticism of it, can, for instance, seriously believe that an ice-field, covering the whole expanse of Northern Russia, ascended the slow slope which the Dwina descends on its way to the White Sea, and without any assured motive power within itself, or *vis à tergo* from without, crossed the watershed, and accompanied the present flow of the Volga, Don, and Dnieper for some three hundred miles to the south.

Sir Henry's own theory—that the changes in question were principally due to a great flood which was caused by "a sudden elevation of a portion of the seabottom"—the reviewer will not allow to account for all the facts; for "the local variations of the boulder-clay are decisive against the hypothesis of its deposition by a flood." But "the most striking part of his work," he concedes to Sir Henry,—

consists in his setting forth, as a scientific reality, of a world-wide flood. All geologists agree that in one way or another the waters were let loose in those days. . . . But it was left to Sir Henry Howorth to recognise and demonstrate the universality of [the] character [of the observed effects], to gauge the significance of their testimony to the occurrence of what was substantially one momentous event, and to apprehend the true relations of that event to the distribution of life upon our planet.

To cumulative scientific proofs of his contention he adds legendary confirmation. The traditions of all nations affirm,

with extraordinary definiteness and unanimity, the interruption, by a deluge, of the early history of mankind. . . . He finds "the story in the Bible interesting—as an early example of a widespread tradition and nothing more."

The great Barrier-Reef of coral which runs at a distance of six or seven leagues from the mainland for more than 1,200 miles along the east coast of Queensland—as described in the just published journals of Captain Cook and in the handsome quarto of Mr. W. Saville-Kent—gives rise to an interesting if somewhat too discursive article.

IN DISPROOF OF MR. PEARSON'S PESSIMISM.

The optimistic reaction which has followed Mr. C. H. Pearson's forecast of "National Life and Character" is illustrated in the first article, which the writer thus recapitulates:—

We have examined at some length Mr. Pearson's premisses and his deductions. We have endeavoured to show that the expansion of the Chinese race need not necessarily lead to an extension of Chinese rule; that the white races of the world are not consequently likely to be deprived of their "pride of place"; and that some of the temperate regions of the earth are still so sparsely peopled that they will afford room for centuries to come for European colonists. If we are right in these conclusions, it is plain that Mr. Pearson has exaggerated the difficulties of the future, and that the conditions on which his whole argument is founded are not likely to arise, at any rate till some remote period. But we have also endeavoured to show that Mr. Pearson's Australian experiences have probably misled him in the second portion of his book; that there is no reason for thinking that socialism in older and thickly inhabited countries will necessarily take the form which it has assumed in Australasia; that there are no grounds for apprehending that the organisation of the State is crushing out individual effort; and that there is no cause for believing that literature, science, and discovery have accomplished their chief successes, but that, on the contrary, the future in these respects is likely to be at least as rich as the past.

Against Mr. Pearson's dismal phophecy, the reviewer asserts his faith in "a power divine which moves to good":—

This faith which religion proclaims has been justified both by history and science. . . . Why should we not . . . hope that the progress which has made the past memorable will be maintained in the future; and that the great Anglo-Saxon race which has acquired dominion over so large a portion of the earth's surface, may retain its pride of place and prove its right to govern by the intellectual eminence of its greatest men?

POETS AT THE BAR OF THE CRITIC.

The writer on "Contemporary Poets and Versifiers" applauds Mr. William Morris's "rich imagination and marked individuality"; regrets that "the other Morris" did not rest his reputation on his "Epic of Hades" alone; allows that Mr. Austin, whose "egotism is rather amusing than offensive," has produced one pretty poem; dubs Sir Edwin Arnold's work "polyglot versifications," which to call poetry is a bad joke; concedes to Mr. Aubrey de Vere "literary cultivation without the bright fire of genius"; finds Mr. Coventry Patmore's "morality so charmingly expressed as to acquire something of the quality of poetry"; fears that Mr. F. Tennyson wrote verse because his brother wrote poetry; acknowledges Mr. Watson's genuine poetry and "perfect expression"; bestows more stinted praise on Mr. Le Gallienne and Mr. Bridges, and gives a word or two of eulogy to Mr. Austin Dobson, Mr. Lang, Mr. Gosse, Mr. Myers, Miss Ingelow ("among our poetesses the best and most true"), Mr. R. L. Stevenson, and to Mr. Kipling as a possible lyricist of the sea.

THE SCOTTISH REVIEW.

THE fare provided for its readers by the *Scottish Review* is substantial and varied, but includes no article of first class importance. The one paper dealing with physical science is that in which Mr. Gath Whitley reviews Sir Henry Howorth's criticisms of glacial theories and arguments for the Great Flood. "Taking a general view of this most interesting controversy," concludes Mr. Whitley, "that it cannot be denied that a great flood closed the Pleistocene period, and swept away Palæolithic Man, and the great extinct mammalia associated with him." "The Standing Stones and Maeshowe of Stenness" in the Orkneys, which are often explained as monumental or sepulchral erections, are by Mr. Magnus Spence connected with the worship of the sun and moon. He pays the prehistoric makers of these shrines the tribute of saying that—

their mathematical skill, their physical power in overcoming almost insuperable difficulties, and their careful observations of the planetary system, prove beyond doubt that they had made marked progress in civilisation. They must have lived in aggregates and worked with united purpose and under the inspiration of religious zeal.

Mr. Alger's presentation of "An Idyll during the French Revolution" will be enjoyed by people curious to know the sort of love-letters which could be written by Rousseau-struck participants in that great social spasm.

RUSSIANS AND "ENGLISH AKIN."

"The meaning of the Russian name" is explored by Karl Blind, who finds that—

the bold warriors who in the ninth century went forth under the name of the "Rus" and the "Warangians," and who subjected the Finnish, Slav, partly also the Tatar tribes of the great north-eastern plain, where they founded the "Russian" empire, were of Teutonic blood.

The result of his investigations is that—

the founders of the "Russian" empire, whose Germanic origin is beyond doubt, either had their name—as Dr. Thomsen thinks it likely—from a word meaning the Rowers, or Seafarers, or, as Dr. Hyde Clarke contends, from the Rugians. The name of the latter occurs in a variety of forms, such as *Ruani*, *Roani*, *Rujani*, *Ruia*, *Ruja*, *Roja*, etc., which comes close enough to Rhos or Rus. As to the Warangians, they were most probably of the Waring kinship of the Angles, forefathers of the English, the name of the Warings themselves being preserved, like that of the Angles, in English place-names.

The tribes of this common kin who migrated to the north-east founded Russia, but lost their original language and free institutions; while those who branched north-west and began the making of England, developed both ancient speech and ancient liberty. The reviewer finishes his history with the picturesque remark:—

To-day, in the far East, the two Empires which were originally founded by Germanic Norsemen, now nearly meet again.

But instead of urging that the two peoples of kindred origin should unite as kinsmen in their kindred task of civilising Asia, he indulges in antithetical rhetoric about "progress and civilisation" on the one side and "oppression," "barbarism," and "tyranny," on the other.

ORIGIN OF THE SCOTTISH PARAPHRASES.

"The Paraphrases" have been so regularly associated in the popular mind with "the metrical version" of the Psalms that many will be surprised to learn from Mr. J. Cuthbert Hadden's painstaking article on the subject, that the Paraphrases were only (and informally) adopted by the Scottish Assembly in 1780. Frequent attempts at framing such a collection were made during

the preceding hundred years, but until then without result. Mr. Hadden declares that—

Scotland has, indeed, every reason to be proud of her Paraphrases, which express so well the better side of the Moderatism of the last century, and which did so much to dissolve the harsh, sour Calvinism that prevailed before their introduction into the Church;

but when enumerating the various authors of these hymns, he shows and grants that "the largest contributor to the collection is Isaac Watts." Out of the entire sixty-seven twenty were by Watts, and five more were "founded on suggestions to be met with in his hymns." In the Bruce-Logan controversy Mr. Hadden unhesitatingly ascribes the disputed Paraphrases to Bruce.

MONUMENTAL LIGHT ON EARLY HEBREW STORY.

"The Earliest Ages of Hebrew History" are reconsidered by Major Conder in the light of "the political correspondence accidentally discovered at Tell Amarna in Egypt, belonging to the fifteenth century B.C.," and of "the Akkadian inscriptions found at Tell Loh," "which cannot be placed later than the twenty-fourth century B.C." From these sources—

the political history of Palestine appears, down to the time of the Hebrew Conquest, to have included two distinct periods—the first being that of Mongol domination, during which tribes of Semitic race, continually increasing in numbers, but living to a great extent in a pastoral condition, pushed southwards from the fords of the Euphrates at Carchemish.

Major Conder infers that among these Semitic tribes the Amorites and the Hebrew emigrants from Ur of the Chaldees "must be included." The second period was one of Egyptian domination lasting two centuries. During the rebellion that followed, the letters found at Tell Amarna from the cities of Joppa, Jerusalem, Ascalon, etc., complain of invasion by the *Abiri*, "a desert people coming from the land of Seir." Major Conder infers that these *Abiri* are the Hebrews under Joshua, and finds in the notice of their conquests "the first possible allusion to Hebrew history as yet known from monumental sources."

The Primitive Methodist Quarterly.

THERE is a great amount of information and suggestion contained in popular form in the current number of the *Primitive Methodist Quarterly Review*. Mr. John Binns's remarks on the "Co-operation of the Churches" call for separate mention. Mr. H. Yooll gives a bright and instructive, if somewhat over-orthodox, version of Mr. Ruskin's teachings and work. The duel between Henry George and Herbert Spencer on the land question is reviewed with an evident preference for Mr. Spencer's earlier and more "absolute ethics." Mr. G. F. Johnson, comparing "Trades Unions, Old and New," concludes "that the success of the New Unionism would prove the destruction of Unionism altogether." The substitution of legislation for association would mean the abandonment of the latter. Mr. W. Raistrick opens up "The Science of Crime" in its more sympathetic aspects. The compatibility of miracles with the harmony of nature when viewed in the light of the Divine Immanence is argued by Mr. Robert Bryant. Mr. Robert Hind in discussing the outlook of "Methodism in Scotland" concedes that "Methodism has scarcely touched the life of Scotland," but urges that it is in some respects more needed there than any other form of religion, and if properly worked is likely to succeed. "Unquestionably," he says, "the itinerancy has been a disadvantage to Methodism in Scotland and hindered its progress considerably." There is some plain speaking about the House of Lords in the last article.

THE NORTH AMERICAN REVIEW.

THE highly important articles which are cited elsewhere,—the symposium on woman as councillor, mother, co-operative cook and self-supporting worker, and the Marquis of Lorne's "Latest Aspects of Imperial Federation,"—give special distinction to the October number of this Review. "The business outlook" as it presents itself to a quartette of financial magnates will appeal chiefly to American readers. The triplet of articles by members of the Ways and Means Committee, on Coming Tariff Legislation, touches British interests more nearly—all the more that reduction of the tariff towards a revenue basis is regarded as inevitable. Mr. John Bigelow recounts the fruitless efforts made by the Southern Confederacy to secure Pope Pius IX. as ally, and takes occasion to describe the southern political leaders as "about the most inadequate men" for the conduct of any great military enterprise. But for the four men, Davis, Benjamin, Slidell, and Mason, there had been no civil war. Mr. Warren K. Moorehead traces the history of anthropology—the "New Science at the Fair"—back to de Perthes's book on quaternary man, published fifty years ago. Mr. T. M. Gilmore pleads for the elevation of the "saloon" or tavern from the category of an object of legislation, reprobation, or repression, to the status of a club and reading-room.

THE BATTLESHIP OF THE FUTURE.

Admiral Colomb of the Royal Navy exposes the influence which mere fashion, sentiment, and stupid adherence to habit exert on the construction of our ships of war. The vicissitudes of the broadside are an amusing illustration. When steam was first used, the paddle-wheels drove the guns forward and aft, and because lessening their number led to an increase in their weight.

Presently the paddle-wheel gave place to the screw, and restored the broadside to its position and power; but we had got so accustomed to the heavy armament of bow and stern that, though there was no more argument in its favour than there had been a hundred years before, we put it into the screw ships by mere force of habit. Of such unscientific procedure, unquestionably, the general result has been to design two great battleships in order to carry a few enormous guns destined to penetrate armour which, in the end, is not offered to either side.

There is not and never was necessity for gigantic guns, which can only be mounted in turrets and barbettes. There is a general feeling of unrest in the face of ships costing a million and weighing fourteen thousand tons each. The sudden and awful loss of the *Victoria* has emphasised what had before been muttered, that there is a want of economy in putting too many eggs in one basket. . . . The tendencies point then, in my opinion, towards giving up the very heavy gun, by consequence the turret and barbette, by consequence the very large and very expensive battle-ship. I believe it will be generally conceded that neither the torpedo nor the ram has any dominating influence over the design of the warship. Speed, coal-endurance, sea-keeping qualities, and the gun, are the main bases of construction.

The Admiral thinks that "if the United States so willed it, she might become the mightiest naval power that the world has ever seen."

THE NEW DRAMA.

Mr. Clement Scott tells the story of "two dramatic revolutions" which he has witnessed. The first was in 1860, when the British stage was emancipated from its previous "slovenliness, boorishness, unintellectuality and want of art." The second (1890-3) is the threatened invasion of Ibsenism or "the dramatisation of the Contagious Diseases Acts." "For thirty years we have kept

the stage in such a condition that no man—if he were not a Puritan—would prevent wife or daughters from entering the theatre door." But now plays are being put forward "whose heroines are monsters and whose atmosphere is mephitic."

It is to my mind no less than a crime to preach from the stage the ridicule of virtue and the splendid courage of suicide. I am no Puritan, I trust, no bigot, I hope; but though I have protested against the Puritan and bigot, and Philistine and Pharisee, for their uncharitable dealings with the stage all my life long, still were Puritan or bigot to stand up and preach against the danger and the disgust that are the outcome of the study of the new drama, I for one could not answer one word.

THE ARENA.

THE October number does not rise much above the average. Mr. Van Ornum's scheme of establishing a currency by voluntary association, Mr. W. P. Mackenzie's account of Free Church Union, and Mr. B. O. Flower's glowing anticipations of "the coming religion," are noticed elsewhere. Mr. R. J. Hinton tells how "the arid region" of the "New West" promises by aid of irrigation to be able to support a population of a hundred millions, and he asserts in all soberness "that this pending development of our continental resources can be, nay, must be, effected upon lines which will automatically develop economic equity in distribution." The accomplishment of this hope depends on the answer to the question which he regards as "a continental issue," Who shall control the sources of irrigation? The three States, Colorado, Wyoming, Montana, in which they lie, or the nation? Rev. H. MacQueary tells of the late R. A. Proctor, that on receiving a cheque for his first literary venture, an article in *Cornhill*, he fancied there must have been some mistake, and only on inquiry learned that magazines paid for such contributions. It is interesting to know that the great astronomer was not above an ardent attachment to whist, chess, and the piano, which he played with "much delicacy of touch and feeling." Mr. J. C. Caldwell proclaims that "the South is American," nay

The strongest, most concentrated force of Americanism is in the South, and Americanism is the highest form of Anglo-Saxon civilisation. There is no part of the globe, except the kingdom of England, which is so thoroughly Anglo-Saxon as the South.

W. E. Manley, D.D., reopens an old dispute by affirming, with much display of classic lore, that the words used in the New Testament to describe the duration of future punishment, do not signify eternal or endless.

WHO IS RESPONSIBLE FOR THE CRIMINAL?

Mr. Henry Wood, in his "Psychology of Crime," makes out that responsibility for the existence of crime rests with society in general and newspapers in particular. "The quality of thinking determines consciousness, and consciousness determines character." The quality of popular thinking, already by no means high, is too largely determined by the daily press, with its detailed narratives of vice and crime; whence follows in natural psychological order, an infection of the general consciousness, and an eruption here and there of crime. Mr. Wood's remedy is "systematic idealism," by which alone "the undisciplined thinking faculty" can be "trained to close its avenues against discordant and depressing environment."

The scientific way to destroy evil is not to hold it up and analyse it in order to make it hateful, but rather to put it out of the consciousness.

The "notes and announcements" contain some of the most interesting features in the magazine.

THE FORUM.

THERE is a considerable falling off from the high standard of the previous number, but the articles for October are on the whole both attractive and instructive. Mr. Frederic Harrison on "The Revival of the Drama" and Dr. Carl Peters on "Prospects of Africa's Settlement by Whites" are quoted elsewhere. "The Rise and Doom of the Populist Party," by Mr. Frank B. Tracy, and "The True Significance of Western Unrest," which Mr. Charles S. Gled finds in general "financial embarrassment" and not in revolutionary mania, are written to show that the West is not moving in the direction of Socialism. Mr. David A. Wells argues that the present crisis has proved "the downfall of certain financial fallacies," such as the alleged "appreciation of gold," evil of decline in prices, "discrimination against silver," "theory of conspiracy," "new coinage ratios." He states that the annual gold product of the world is increasing and promises to increase still further. Mr. Ernest Hart, editor of the *British Medical Journal*, upholds and magnifies the strictest canons of medical etiquette in relation to quacks, homœopaths, and secret remedies.

THE KINDHEARTED SOUTH.

"The burning of negroes" who have assaulted white women is attributed by Bishop Haygood to a temporary fit of "emotional insanity," which he is not disposed to condemn too severely.

The Southern people are not cruel and never were. They are kindhearted people; good to one another and to all men. . . . They were kind to the negroes when they were slaves; they are kind to them now. . . . But the Southern people are now and always have been most sensitive concerning the honour of their women—their mothers, wives, sisters, daughters. A single word questioning the purity of Southern women has cost many a man his life.

If only the educated negroes who, except in the rarest instances, never commit crimes against virtue, and if only the Northerners would denounce these crimes as they now denounce lynchings, both class of offences would become as rare as in the days of slavery. Mr. Charles H. Smith alleges that too much education has ruined the negro for manual training, which is his only resource, and declares that "the negro will have to be disfranchised and a separate code enacted, that will fit him." "The tendency everywhere is for the whites to rent out their farms and move to the towns, where they can safely educate their children," and the friction between the two races is growing to an ominous pitch.

HAVE "REAL WAGES" RISEN?

Colonel Carroll D. Wright, United States Commissioner of Labour, presents important generalisations concerning "Cheaper Living and the Rise of Wages," which he has drawn from a recent Government report on wholesale prices and wages during the years 1840 to 1891. He finds in a general comparison that wages, considered relatively to the importance of one industry to all industries, stood at 82.5 in 1840, at 155.6 in 1866, and at 168.6 in 1891 relatively to 100 in 1860, and that the prices of 223 commodities entering into consumption, on the basis of the importance of each article in proportion to the importance of all, have risen from 97.7 in 1840, relatively to 100 in 1860, to 187.7 in 1866, and fallen from 100 in 1860 to 94.4 in 1891;

the conclusion being positive and absolute that, while the percentage of increase in prices rose in 1866 to a point far beyond the increase of wages, prices have now fallen to a point lower, on the whole, than they were in 1840, and wages have risen even above the high point they reached in 1866.

The inevitable conclusion is said to be that

whenever the prices of commodities rise, they rise higher relatively than does the price of labour, and that when prices go down, they go down much lower relatively than does the price of labour, which remains ordinarily very nearly at its inflated price.

"CHICAGO AS A LITERARY AND ART CENTRE."

Mr. Hamlin Garland proclaims "The Literary Emancipation of the West."

Boston has lost its high place. New York to-day claims to be and is the literary centre of America. . . . Henceforward New York and not Boston is to be the great dictator of American literature. . . . And yet New York is in danger of assuming too much. . . . New York, like Boston, is too near London and Paris to be American. It is not in touch with the West. It is losing touch with the people. Chicago is much more American, notwithstanding its foreign population. . . . The rise of Chicago as a literary and art centre is a question only of time, and of a very short time, for the Columbian Exposition has taught her her own capabilities in something higher than business. The founding of vast libraries and universities and art museums is the first formal step, the preparation stage; expression will follow swiftly. Magazines and publishing-houses are to come. The writers have already risen.

The East considered itself English in general character. . . . As a matter of fact, the West is not English. The Northwest is more largely Teutonic and Scandinavian. . . . The literature rising from these people will not be English. It will be something new; it will be and ought to be American—that is to say, a new composite. . . . There is coming in this land the mightiest assertion in art of the rights of man and the glory of the physical universe ever made in the world. . . . We are standing for a literature which shall rise above culture, above library centres and literary masters, to sincerity of accent and to native democracy of sentiment, and, above all, to creative candour.

WHY LONDON IS THE WORLD'S FINANCIAL CENTRE.

Mr. I. L. Rico objects to managers of "public business" claiming a "right to steal," which no one would allow in private life. He characterises free coinage of silver, anti-railroad legislation, and similar measures as simply robbery. He contrasts English public life:—

London is the financial centre of the world, not only because of its location, but because it is known that there honesty pervades public financial affairs; that public obligations are sure to be met; that mortgages are safe from violation; and that the internal affairs of public corporations are expected to be administered for the benefit of shareholders and creditors.

SCIENTIFIC ARTICLES.

Professor R. O. Doremus declares from lengthened experience of chemical criminal investigations, as "a reasonable conclusion," "that there is no poison to which the public has access that cannot be detected." "The metallic poisons can be detected, by our improved methods of research, years, yes, centuries after death, if the body has been protected from mingling with the soil." Mr. E. S. Holden, director of Lick Observatory, discusses and approves Professor Vogel's explanation of "the wonderful new star of 1892," which increased in brilliancy sixteenfold in two days, and then after an interval of disappearance reappeared a nebula.

Atalanta.

The attempt to make Wagner's drama understood by the average man or woman is successfully undertaken by Mr. Farquharson Sharp. A synopsis of *Der Ring des Nibelungen* is rendered in stirring prose. "Warwick Castle," in the "Stately Homes of England" Series, is well illustrated.

The London Quarterly Review.

THE first place is awarded to a depreciatory review of "modern Congregational theology," as set forth in "Faith and Criticism." This is described as "a disappointing book," whose "chief lack" is "the absence of a clear vindication of Scripture as the sufficient and authoritative guide." "The Apostolic Succession" is severely criticised, as leading logically to "materialistic magic," but hopes are cherished that "the experimental religion of our high Anglican brethren will one day burst the bonds" of this theory. "The Methodist Agitation of 1835" forms the subject of a retrospect highly unfavourable to the projects of the reformers. "An English Ultra-montane Philosopher" is the late W. G. Ward, who is described by the reviewer as having done "a greater service than any man of his generation" "for the theistic controversy." Of the non-theological articles, the most attractive article is an appreciation of "Three poets of the younger generation"—William Watson, Norman Gale, and Arthur Symonds. "Early English Literature" is a review of Rev. Stopford Brooke's "History." There are also memorial reviews of Lord Sherbrooke and of J. Addington Symonds's "Life in the Swiss Highlands." "The Future of British Agriculture" is suggestively and hopefully treated, "an alleviation from the excessive taxation imposed upon the agricultural for the benefit of the industrial community" being put forward, however, as "at present the only remedy for agricultural depression."

The Dublin Review.

THERE is not a little variety of historical and present-day interest mingled with the more solid theological contents of this Review. "The Eucharistic Congress at Jerusalem," where the Pope for the first time consented to be represented along with dignitaries of the Oriental Churches, is reviewed by Lady Herbert, who states as one of its two great results "a strong and sensible movement towards the union of the separated Churches." She urges the clamant need of such reunion, for—Protestants will be interested to hear—the Russian official Church is threatened with extinction by reason of its fifteen millions of Dissenters. "The Protestant universities train the greater number" of the priests in the Greek Church, and the leaven of Protestantism is rapidly spreading in the Balkan provinces, in Egypt, Palestine, and Syria. That Anglicans are not to be included in the projected reunion appears in the Rev. J. D. Breen's vehement denunciation of "Rome's Tribute to Anglican Orders." Professor De Harley attributes "the propagation of Islam" in old times to force, in modern times to its simplicity, easy ethics, and sensuous heaven. He calls for "a general union of all Christian powers" against it. Miss Clerke graphically epitomises the story of Father Ohrwalder's captivity under the Mahdi. Rev. E. C. Butler claims that Bishop Lightfoot's version of early Christianity establishes "St. Peter's primacy, his connection with the Roman Church as bishop, the primacy of that Church from the dawn of Christian history." Rev. F. D. Gasquet brings forward much contemporary evidence to prove that during the fourteenth and fifteenth centuries the religious instruction imparted by the Church was far superior to what Protestant historians have generally made it out to be.

Great Thoughts gives a brief biography of Mrs. Gladstone, with a portrait, an interview with Mr. Barry Pain, and a number of other features of interest.

The Strand.

THE illustrated interview with the Lord Mayor of London is much more interesting than the average of such articles. The many engravings of rooms in the Mansion House will make people acquainted with the residence of what ought to be the Civic King of London. The chapter on "Ears" is curious. The selection for illustration is certainly catholic. Surely never before have Cicero and Charlotte Yonge, Swinburne and Cardinal Manning, Miss Fortescue and Queen Victoria, served to illustrate one article. Paul Hardy contributes a capital translation of Jules Claretie's "Last Tramp."

The Idler.

CONAN DOYLE writes a most gruesome story, "The Case of Lady Sannox," which everybody is certain to read and then wish they hadn't. E. W. Hornung brings us another bride from the bush. His writings are always fresh and unconventional. Philip Bourke Marston has a pathetic sub-humorous poem of "Poet and Cobbler." The interview with George Meredith is chiefly valuable for a fine pencil drawing of the novelist's head, and for the evidence that the American appreciation of his writings is returned by him in warm admiration of the American people. The article on Father Ignatius is noticed elsewhere.

The Woman at Home.

THE second number of the *Woman at Home* is a marked advance upon the first. The Duchess of Connaught is the subject of a very appreciative sketch. Baroness von Yedlitz tells "How I Brought Liszt to London." The page of "Confessions" by Sir Edwin Arnold is characteristically modest. His favourite occupation is "Being useful," as distinguished from his "Favourite pastime, Work," while his "Favourite Holiday Resort" is "The Globe." The article on Lady Charles Beresford is noticed in another place.

The Review of the Churches.

THE October number is varied, fresh, and well up-to-date. Dr. Gilbert's account of the Parliament of Religions is noticed elsewhere. The Parish Councils Bill is the subject of a Round Table Conference, in which part is taken by Rev. A. R. Buckland, editor of the *Record*, and chief promoter of the clerical agitation about the Bill, as well as by such hearty supporters of Mr. Fowler's measure as Revs. Charles Williams, C. A. Berry, and J. Frome Wilkinson. It is evident that the principal battle will be over the administration of the parish doles. The official vindication of Dr. Kate Bushnell and Mrs. Andrews on the Cantonments question gives Dr. Lunn an opportunity for driving home certain salutary truths on "missions and morals,"—which he does *con amore*.

Frank Leslie's Monthly.

THEATRE-GOERS may be interested to read the description of "How a Play is Produced"—not from the brain of the author, but its mechanical setting and accessories. The endless rehearsals in silent unlit theatres, the making and altering of scenery and properties, the thousand and one details to be arranged before ever the play comes before the public, ought to convince stage-struck youths that an actor's life is very far from being all "beer and skittles."

THE ILLUSTRATED MAGAZINES.

WILLIAM HOLMAN HUNT.

THE new Christmas number of the *Art Journal*, better known as the "Art Annual," deals with an unusually interesting artist and his work—William Holman Hunt, by Archdeacon Farrar and Mrs. Meynell.

THE ARTIST.

Writing of Mr. Holman Hunt the artist, Mrs. Meynell says:—

The history of Mr. Holman Hunt in his youth is the history of the movement which bore the oft-misrepresented name of pre-Raphaelitism. Mr. Holman Hunt was pre-Raphaelitism, and what he was he has remained. . . In a sense his youth has never ceased. At the end of this year, 1893, he is at work upon that very design of the "Lady of Shalott" for which he made the first study when the Tennyson romance was young.

When Mr. Holman Hunt began to work on actual Scripture subjects in actual Scripture scenes, he left England persuaded that the principles he had tested by labour and thought through a number of years might be applied more largely in religious art. He remembers now with surprise that this religious work awakened no kind of interest among the members of his church at home. "The Light of the World" was bought by a printer, and "The Finding of the Saviour in the Temple" by a brewer.

At the middle period of his life Mr. Holman Hunt made the East much his home. "His pictures," adds Mrs. Meynell in conclusion, "were the work of years crowded with intense activity. He spent his life and strength over 'The Shadow of Death.'"

HIS PICTURES.

Part II. of the "Annual" is devoted to Mr. Holman Hunt's pictures, and is contributed by Archdeacon Farrar, who writes as one of the multitude, desiring simply to

point to qualities and meanings which are not beyond the reach of any intelligent student, and to tell others what he himself has seen in the pictures. It would be impossible here to quote from the descriptions of all the pictures thus dealt with by Archdeacon Farrar: "A Converted British Family Sheltering a Christian Missionary from the Persecution of the Druids," "The Hiring of the Sheep," "The Wandering Sheep," "The Awakened Conscience,"

"The Light of the World," "The Scapegoat," "The Finding of the Saviour in the Temple," "The Triumph of the Innocents," "Christ Among the Doctors," "May Day on the Maiden Tower," "The Shadow of Death," but the following notes will give some idea of the interesting work of the artist supplied by Archdeacon Farrar.

DIFFICULTIES IN PALESTINE

In order to paint "The Finding of the Saviour in the Temple" Mr. Holman Hunt, in 1854, went to Egypt, and then to Palestine. In the group of Jewish doctors he desired to find the most suitable model among the living modern Rabbis in Jerusalem. In these authorities he was entirely mistaken. They regarded him as a paganist of the mission to the Jews, refused to sit to him, and even communicated those who were willing to sit to his studio. When he did at last persuade a few of them to become his models,

STUDY FOR "THE SHADOW OF DEATH."

they were so worried by their companions that they left off sitting, and the painter's labour was thrown away. But his heart and soul were entirely in his subject. He had that invincible "genius for taking pains" which he has ascribed to his friend Rossetti. The difficulties with the Rabbis was partly overcome by the intervention of Mr. F. D. Mocatta, but the picture of Christ and the Virgin had to be postponed till the work was finished. Mr. Hunt's object was not merely to

Orientalists as models, but to show the old Jewish life as nearly as possible as it actually was.

"THE SHADOW OF DEATH."

In this picture, exhibited in 1874, Mr. Hunt has carried a step farther his purpose of depicting, as far as possible, Bible subjects amid their actual surroundings.

It is one of the pictures in which Art has tried to answer the question of the unspiritual Nazarenes, "Is not this the

The accessories, however, are only the merest framework of the central thought. Mr. Hunt has endeavoured to set before us Jesus in His humanity, Jesus as He lived unknown, unnoticed, a poor and humble labourer in the common lot of the vast majority of the human race, glorifying life simply as life, labour simply as labour. And, therefore, Mr. Hunt has not painted a being irradiated with aureoles and nimbus. . . . Christ has been toiling for long hours at the manual labour which He exalted, and the evening has come.

DRAYCOTT LODGE: MR. HOLMAN HUNT'S HOUSE.

carpenter?" So far as I know there has not been one other attempt in Art to paint Jesus as a young man, exercising the humble trade in the village of Nazareth, by which He glorified labour for all time. He alone has had the strong simple faith which led him to choose as a subject "the Lord of Time and all the worlds," working for His daily bread in the occupation of a Galilean artisan. Mr. Hunt studied every detail, every accessory on the spot. He went to Bethlehem to examine types of face, because it is said that there the inhabitants recall in some features the traditional beauty of the House of David. He painted the interiors of carpenters' shops both at Nazareth and at Bethlehem.

He has risen to uplift His arms in the attitude of prayer; His eyes are turned heavenwards, His lips are open in supplication. Mary is kneeling at His right, fondly opening the coffer which contains the gifts of gold and frankincense and myrrh. . . . But suddenly looking up, she has caught sight of a shadow on the wall, and it has transfixed her with awe and terrible forebodings. For what she sees is the shadow of death, and the shadow of a death by crucifixion.

The picture was purchased by Messrs. Agnew, and some years later presented by them to the Manchester Art Gallery.

OTHER ART MAGAZINES.

The Art Journal maintains its high reputation under Mr. David Cral Thomson's editorship. The *Magazine of Art*, which has been in existence fifteen years, has just begun a new volume, with the price raised to 1s. 4d. Three plates are to be given henceforth, a photogravure or an etching as frontispiece, and two other plates, all executed by the best processes of the day. Printing in colour is also to be a special feature.

The *Studio* remains as interesting as it was when the first number made its appearance in April, with Mr. Gleeson White as editor. It is a mid-monthly, and the October part is an excellent special arts-and-crafts number.

The *Quarterly Illustrator* is an American art magazine, also started this year. It surveys the work done each quarter in the way of illustrating; and gives a representative selection from all the great illustrated periodicals, with critical notices of magazine illustrators.

The *Art Amateur* is another capital American art magazine. It is devoted more especially to the interests of the amateur, an important feature being the coloured plates for copying. There is also an English edition published by Messrs. Griffith, Farran and Co.

The Pall Mall Magazine.

MR. A. H. SAVAGE LANDOR writes of his travels among the Ainu, the "monkey-like," "dog-like," "bear-like," aborigines of Japan, who are slowly becoming extinct. They now only number about eight thousand. "Some of the strange peculiarities of the Ainu are their extreme hairiness all over the body, the immense length of their arms and toes." They rank very low in the scale of human development. They are extremely good-natured and gentle, but from our moral point of view, they have no morals at all! They possess no laws and marriages are in no way regulated. They are polygamists, and they have no religion beyond a very perfect form of Totemism, the central point of that belief being their own descent from the "bear." The article, which is well-illustrated, is rich in information. "Stray Echoes from Friedrichsruh" reproduce the life of the German ex-Chancellor as country squire, and the portraits of him are very fine. In "The Sere, the Yellow Leaf," Sarah Grand concludes a painful lesson on the apples of Sodom, to which the life of a society beauty turns when the inevitable old-age overtakes her. If any one is fired by a desire to catch giraffes he will, in Mr. H. A. Bryden's article, find all necessary directions, and a large amount of information on the subject.

The Century.

THE illustrations this month are scarcely up to the usual high standard. Mr. C. W. Allers's portrait of the old man Bismarck, seated by the table with his pipe and his newspaper, is very fine. It accompanies Miss Kinnicutt's account of her visit to Friedrichsruh, which is noticed elsewhere. Josiah Flynt's experiences among American tramps are set off with some vivid engravings by Mr. J. C. Lucas and M. Frantschold. But Mr. G. W. Edwards's quaint pictures of "the factions of Kitwyk" form the gem of the magazine. There is the wonted

admirable variety of reading matter. "Taking Napoleon to St. Helena" finds notice on another page. So does Emerson's poem "To Lowell on his fortieth birthday." A lecture by Lowell appears on "Humour, Wit, Fun, and Satire." It describes Cervantes as "beyond all question, the greatest of humourists," and declares Don Quixote to be "the everlasting type of the disappointment which sooner or later always overtakes the man who attempts to accomplish ideal good by material means."

Miss Virginia Vaughan tells the life-story of "George Michel, the painter of Montmartre," and remarks of him as a rare feat that he did "his greatest work from sixty-five to eighty, and merely for the delight it afforded him, without any of the incitements either of ambition or of necessity." The "Memories and Letters of Edwin Booth" are presented by his friend, Mr. Bispham, in a somewhat desultory fashion.

The English Illustrated.

THE frontispiece is a fine portrait of the late Surgeon-Major Parke. This faces an article by Herbert Ward, entitled "Martyrs to a New Crusade," which contains extremely laudatory obituary notices, with excellent portraits of Major Barttelot, Mr. Jameson, Captain Stairs and Captain Nelson. Mr. Andrew Lang contributes reminiscences of Balliol College.

"The Shooting Season at Sandringham" is illustrated by a series of portraits—that almost verge on caricature—of the Prince of Wales as sportsman. Mr. Clemat Scott gives us a very unflattering picture of the Japanese Girls. "The most over-praised and over-rated people in the world," "shuffling, undersized, featureless dolls, cobby in shape, as fat as dumplings, and without a trace of grace in movement or carriage"—are some of the compliments he bestows on the Japanese. In Mr. Scott's excuse it must be noted that he visited Japan in the early spring when he quivered under the bitterest N.E. wind he had ever endured.

Harper's.

EDWIN LORD WEEKES concludes his papers of Persian travel "From Tabreez to Ispahan." Ispahan itself is worthy in its Oriental magnificence and uncleanness to be the home of the "Thousand and One Nights." On all sides of it stand the ruins of magnificent palaces and gateways set in gardens of rank luxuriance. Much of its vanished splendour lies at the door of Jenghis Khan Timour and other invaders. The College of the Dervishes, besides gorgeous architecture, white marble-faience, carved wood, has its door encrusted with silver, richly wrought. Terrible experiences of cholera and fever were endured by the travellers, which at last ended, as all the world knows, in the death from typhoid of Mr. Theodore Child.

Colonel Dodge this month deals with riders of Turkey in his series of horses of all lands. Some engravings of the Sultan's famous white Arabs are given.

Mr. Arthur Symons writes of the Decadent Movement in Literature. He describes Impressionism and Symbolism as the two main branches of that movement, both seeking after the very essence of truth—*la Vérité vraie*.

Portraits are given of the Apostles of the new movement—Paul Verlaine, Maeterlinck, etc. The illustrations are scarcely up to the usual average.

"THE RELIGION OF A LITERARY MAN."

THIS delightful little book* is an aftermath of the newspaper controversy which took place last year on the question, "Is Christianity played out?" It will be remembered that Mr. Le Gallienne was one of those who then took up the cudgels in behalf of what was called "essential Christianity." In these pages he develops and strengthens the position he then assumed, and calls the result "Religio Scriptoris." And a very charming and altogether noteworthy thing this result is. Mere undogmatic Christianity some people will call it, and indeed there is nothing about it that is new—only a very vivid and penetrating restatement of well worn truths. But, for all that, the book is a fine spiritual tonic, and the devout strenuousness of Mr. Le Gallienne is altogether refreshing, in comparison with the languid agnosticism which only too often passes for the religion of a literary man. Perhaps the chief charm of the book is its careful attention to perspective in religious things. Mr. Le Gallienne is a sworn foe both of the dogmatist and the sentimentalist. He has scant respect for the creeds and churches of modern Christendom. But he so restates and rearranges the fundamental truths of Christianity, that his religion appears a great deal more Christ-like than that of most of those who profess and call themselves Christians. His doctrine of the "Relative Spirit" and the distinction he draws between what is provincial and what is universal in religion is a very necessary one, and is at the foundation of his whole position.

It is under the guidance of this "Relative Spirit"—which is not a "familiar," but simply a way of looking at things in their true proportion—that Mr. Le Gallienne declares that the vital question for this modern world is not as of old, What is truth? but rather, What is sin? After a pregnant discussion he gives the following answer to the question, which shows at once how widely he differs from, and how nearly he approximates to, the orthodox Christian position. "Generally stated I would define sin as that which in any time or country, or under whatsoever conditions or outward appearances, means the living by the lower instead of the higher side of our natures." It is a little difficult to reconcile our author's discussion of sin with his doctrine of free will, and probably he would say that it is not necessary to attempt to do so. He is not a theologian but a literary man, and so may be suffered to say that we have more to gain by losing our free will than by keeping it. As with free will, so with the Hereafter. It does not matter whether we believe in it or not. "Those who want to believe in a future life can do so. No philosopher can rob them of it, and probably the arguments are the stronger on the side of belief. Even if it be an illusion, illusion, as we have said, is one of life's methods."

It may be thought that this eviscerates Mr. Le Gallienne's religion of all that is really religious. But a further dip into his book corrects this impression. We have no space to discuss his treatment of "Essential Christianity," "Dogma and Symbolism," and "The Religious Senses." A few extracts will serve to show the trend of thought, though no mere extracts can give an adequate idea of the spirit in which Mr. Le Gallienne deals with his subject. Speaking of Christ he says: "The significance of Christ as a historical figure is not so much that He was the prophet of any absolutely new religious institutions, as that He gathered up into one masterful synthesis those that had enjoyed but an isolated expression afloat. The intense spirituality of the Hebrew; the

impassioned self-annihilation of the Hindoo; the joyous naturalism of the Greek; He combined all these in an undreamed of unity, and gave to it the impetus of His own masterful, emotional individuality." "We have been told that the world has tried the Gospel of Christ and found it wanting. The world has never tried the Gospel of Christ, and in this nineteenth century of the so-called Christian era, it has yet to begin."

The following sentences are characteristic. "Catholicism is simply average humanity in a surplice—that is the secret of its hold upon the world." "Self-sacrifice is no ideal dream of a gentle soul, it is seen to be a condition of man's happiness evolved by nature for herself out of the depths of her own rough heart; and if from the stern strife of conflicting needs so fair a flower has come, how true seems the intuition of the mystic, that God Himself may after all be Love." "Truth always comes, as Christ came, in the garb of absolute simplicity. He seems a mere child, a peasant person. The learned doctors will have none of him. Love God and love one another! Is that all? That we have known from our youth up. Yet there is nothing else to say."

It is easy to object that all this is poetry rather than theology, but it is a good religion for all that. And if this is the religion of literary men, all we can say is, would there were more of it!

"THE COMING RELIGION."

THE manufacture of religions is evidently a thriving modern industry. Its output, if one may judge from current periodical literature, is remarkably large. Perhaps of all magazines, the *Arena* has the greatest stock of this commodity on hand. Scarcely a number passes without announcing the new theology, the new church, the new religion which is to eclipse all its predecessors, and to bring the millennium within measurable distance. In the October issue, the editor himself, Mr. B. O. Flower, contributes his prophecy—happily soberer and less arrogant than the average. He recalls the "great revelations of our day"—the progress in physical science, and notably the general adoption of the evolution theory,—archæological research, with the light its discoveries have shed on Old and New Testaments,—the disclosure to the West of the ancient religions of the far East, with the noble ethical teachings of the Avesta, the Rig Veda, and the Buddhist Bible,—the ready intercommunication of persons and ideas due to modern facilities of travel, press, post and telegraph, which jostle together the professors of a dozen different religions in the Midway Plaisance of the Chicago Fair,—and the new psychical research, resulting in "Christian science," mental healing, and theosophy:—

It is no exaggeration to say we are living in a new world, and he who would help mankind in any vital way must recognise this truth. This is precisely what the earnest thinkers among the theologians, who have embraced what is known as the Higher Criticism, appreciate. . . . To them the Creator is no longer the God of a peculiar people, with an ear for ages deaf to the cry of earth's teeming millions, but in Him they behold the love and life-essence of the universe. Instead of a greatly magnified man, they see a wise, ordering, and conscious Energy, which through the tireless ages, step by step, leads life from the lowest forms on to heaven-spiriting man. To them, in the light of to-day, religion reflects the sanity of the Infinite. . . . And because these scholars are walking hand in hand into the larger truth which God has given to the world to-day, they will succeed, and their success means far more than the triumph of a faction. It will mark a higher altitude in the religious development of the world. It will usher in an era of peace in place of the terrible strife of the past.

ROYAL ROADS TO LEARNING.

TWO EXPERIMENTS: "ABBOTSHOLME" AND "BEDALES."

A LONG with other signs which are now visible of a stirring among the dry bones of education, two schools have lately been founded on somewhat novel lines, embodying in several respects what may be called **REVIEW OF REVIEWS** principles. One of these, Abbotsholme, was founded five or six years ago, and, under the vigorous and enthusiastic care of Dr. Cecil Reddie, the headmaster and founder, is now an assured success. Bedales, which was founded only last year by Mr. J. H. Badley, formerly Dr. Reddie's assistant-master, and like him an educational enthusiast of strong practical bent, promises apparently no less well. The two schools are quite independent, and to some extent each has its own lines; but they both set in the forefront the principles to which I referred. Among these is the recognition that half our old teaching methods are as obsolete as the stage coach. In our days, educationalists have begun to learn their business afresh, studying it from the point of view not of the teacher merely but of the taught. The result of this is the development of systems like the Kindergarten, Sloyd, Tonic Sol-fa, and M. Gouin's, and the free use of models, games, and the magic lantern for the purposes of work as well as play. Dr. Reddie and Mr. Badley are strong on Reform of Educational Methods, on the plan of enrolling eye and hand along with ear as the schoolmaster's Triple Alliance, and calling nothing common or childish which may help to interest a child and make him catch some notion of what his teacher is driving at. Our articles on M. Gouin's method appeared when Bedales was being organised, and one of Mr. Badley's assistants went to Paris to learn the method from M. Gouin himself. It is now in full

swing at the school for the teaching of French and German. Allied with these reforms in method is the doing away with the system of narrow competitive cram under which Latin Grammar and other things, excellent in

themselves (science, for instance, in many so-called modern schools or "modern sides" of classical ones), are to monopolise an English boy's best learning years, to the practical exclusion of all knowledge or interest about the great facts of his own country, past and present, here and over seas. This blunder is doomed. National patriotism is worthy of a place among the school subjects of the new era. Another impulse of the times, equally healthy, is the instinct of escaping

from the eternal round of factories, machines, and machine-made education, with its competitive individualism, to the atmosphere of manual crafts and outdoor industries. Dr. Reddie and Mr. Badley maintain that, at most schools, the alternative is

between book competition and games competition, and that even our good British sports, with their possibilities for bringing out the spirit of co-operative comradeship, tend to become a sort of specialised class-amusement, as if cricket were the only kind of work a gentleman could properly do with his hands. Mr. Ruskin with his road-making and weaving, Edward Carpenter with his market-gardening,

Mr. Gladstone with his tree-felling, should highly approve the way in which at these schools gardening and carpentry and the like are put into the regular day's programme.

In some photographs which have been sent me, Abbotsholme boys are seen building a cricket pavilion, a boat, a dove-cot; Bedales boys bridging a lake

ABBOTSHOLME FROM MONKSCLOWNHOLME.

BEDALES: THE SCHOOL, NORTH FACE.

draining the football field, digging a garden bed. One breezy photograph shows the Abbotsholme boys bringing the hay harvest home, in fine old style, with harp, sack-but, psaltery and all kinds of music. The idea is that the varied day with its alternations of manual and brain work and games, and social recreations in the evening, is so interesting that the youngsters need less driving during the brief hours at the desk. Very brief these seem, compared to the usual time-table; but then both Abbotsholme and Bedales disavow any wish to be a wheel in the great "Competition Mill," the pivots of which are scholarships and money prizes. Marks and prizes, by the way, are dispensed with at both schools, and I am assured that their presence is not at all missed.

But of those points which deserve special mention in these pages, perhaps the chief is what I may call the Anti-obscurantism of both these schools on the great character question.

Both assert strongly the schoolmaster's duty to look after Character equally with Mind or Body. No school on earth can make up for the want of a good home in this respect. But it is something to have the importance of the thing practically recognised.

ABBOTSHOLME: BUILDING THE PIGEON-HOUSE.

faculties and temptations: Björnson's bold advocacy of simple lessons in physiology would be scouted out of court, and then, when a scandal comes out, a scapegoat

or so is made—often some wretched youth more sinned against than sinning, who is ruined for life to bolster up the great conspiracy of silence—and everything goes on as before. At the present day happily the braver and more earnest schoolmasters are beginning to

WHAT IS EDUCATION?

A LECTURE BY WALTER WREN.

I AM here by invitation of my old pupil, your Head Master, and of yourselves, in the hope of being able to give some information, guidance, and advice which may be useful to you as learners. Aristotle teaches us that there are three requisites for a speaker's deserving belief—*ἐννοία, φρόνησις, ἀρετή*, which I would freely translate: "prudence in choosing the right topics, ability to satisfy his hearers that his aims are pure and unselfish, and to convince them that he has their interest at heart."

I have one disagreeable thing to say—I will get it over and done with. The writing of your invitation and of your signatures was not good enough. Do not underrate the importance of good handwriting. Every learner should systematically practise good readable handwriting. He should be able to read his own notes and common-place books as easily as print. The lines should be the proper distance apart, and the margin wide enough to allow the insertion of notes and references. Good writing is most important. It is useful whatever your future career—whether Law, Physic, or Divinity, Army, Navy, or Diplomacy, Oxford, Cambridge, or the Civil Service. I learned this a great many years ago from an order or instruction made by Lord Palmerston when he was at the Foreign Office. Examinations have to be gone through. It is no good for answers to be complete, terse, and accurate unless they are also readable. There is no need for a teacher to preach to a learner on the evils of ignorance—how the ignorant are at the mercy of the learned, how dull and sordid and grovelling are the lives of the ignorant. You asked me to come among you as a teacher; let me teach you what I can in the time allotted me.

I think the first thing that made me a teacher was my noticing, when a boy, how men and women read books and papers, and knew no more about them when they had read them than they did before. They heard the Old Testament read out to them once a year, and the New Testament three times, and there were—and doubtless are—many good people who read a chapter of the Bible every night of their lives. Some of them, after many years, know little or nothing more about it than when they started.

Lots of people seem to know nothing, and to want to know nothing; at any rate, they never show any wish to learn anything. I was once in a room where not one person could say where Droitwich was; once at a dinner of fourteen where only one besides myself knew in what county Salisbury was. I have asked, I believe, over a hundred times where Stilton is, and have been told twice. This when Stilton cheese was handed. I mention this to show the peculiar, conservative mental apathy of Englishmen: one would think people would not go on eating Stilton cheese for twenty or thirty or more years, and never ask where it was. Never be inattentive; never let things slip through your minds like water through a sieve.* Notice everything as you read. If you read a leader or article in a paper or magazine, and come to a French or German word of which you don't know the meaning, never let it go by. Ask as soon as you can; don't cultivate mental laziness. I will give you one or two more illustrations of this. I saw in a magazine not long ago mention made of the three estates of the realm—Queen, Lords, and Commons. Neither writer or editor knew that the three estates are the Lords spiritual, the Lords temporal, and the Commons. A distinguished statesman not long ago gave the following quotation:—

"I'm the blessed Glenliver;
'Tis mine to speak, 'tis yours to hear."

which he said was from Thomas Moore. There are about as many mistakes as could be crammed into that number of words. It should have been, "I am a blessed Glenliver," etc. It is from the parody of Southey in "Rejected Addresses." Nobody who knows Tom Moore calls him Thomas. Not long ago a most distinguished literary man—one to whom I would take off my hat—quoted from Rogers' "Satires":—

—"lauding from their several tubs,
Stubbs praises Freeman, Freeman praises Stubbs."

* Bishop Butler's "Introduction to Sermons."

saying "praises" instead of "butters," so that the joke of the tubs is lost. I read lately, "'It's the seasoning as does it,' as the sausage maker in 'Pickwick' said." The only sausage maker in "Pickwick" is the master of the celebrated sausage factory who rashly converted himself into sassaiges—as was found out by his trousers' buttons. It was Mr. Brook the pieman, whose pies were all made of them noble animals, cats, and who could "make a weal a beef-steak or a beef-steak a kidney, or any one on 'em a mutton, as the market changes and appetites wary." For a reviewer of a new edition of the Waverley Novels in a first-rate daily paper to speak of Sir Edward instead of Sir Arthur Wardour (in the "Antiquary") is perhaps venial, but we cannot say that of a leader writer in another first-rate daily, who wrote:—"You do not understand the beggarly trade you have chosen," said Mr. Osbaldistone to Frank in "Guy Rannering," instead of "Rob Roy." Another quoted:—"There are two kinds of particularly bad witnesses: a reluctant witness, and a too-willing witness; it was Mr. Winkle's fate to figure in both characters," with Snodgrass substituted for Winkle—a very strange mistake, for Mr. Snodgrass's examination is not given; and if there is any one piece in "Pickwick" more likely than another to make a lasting mark on one's memory, surely it is the account of Mr. Winkle in the witness-box. A distinguished officer wrote a letter to a daily, which had the honour of large print, in which he gave a quotation from Swift's "Directions to Servants" to Sydney Smith. Another wrote of Wegg (in "Our Mutual Friend"), and his liking for whiskey and water. I cannot remember that the word sausage-maker is used in "Pickwick," or whiskey in "Our Mutual Friend." Wegg spoke to Mr. Venus of a glass of rum and water "with a slice of lemon in it, to which you're partial." I could give more, but the above are enough. I had best not give too many. Each additional one increases the danger I incur of making a mistake myself.

I once had a large class of very clever young men from the best public schools in England. (They are called public, I believe, because endowed with large incomes which ought to be spent in the interest of the "Public," and why "the Public" allow them to be misappropriated as they are is one of the things no fellow can make out.) Not one of them could read; i.e., there was no communication between their brains and the book. I told them to read first a bit of "Robinson Crusoe," then Gulliver's "Voyage to Lilliput," then "Waverley." I gave them examination papers on all, lectured them on their answers, and so literally taught them how to read. In the paper on "Waverley" I asked a question involving knowledge of the Highland way of hunting deer at the time—making a circle or surround, and gradually making it smaller and smaller, till they were able to enclose and shoot a lot of deer. The Highland word for that surround is "TINCHEL." Not one did the question or had noted the meaning of "tinchel." I told this story to two most distinguished Oxford scholars—men of European reputation—as a proof of habitual carelessness in reading. I saw them exchange guilty looks, and said, "You neither of you know." They laughed, and admitted that they had read "Waverley," and did not know; the fact being that they read carefully only the books relating to their special subjects. Had that word occurred in Aristotle or Plato they would have told me in a minute. This is a specially good illustration, because almost everybody who has read anything at all has read Scott's "Lady of the Lake." In the description there of the battle of Beal an Duine we read:—

We'll quell the savage mountaineer
As their tinchel cows the game.
They come as fleet as forest deer;
We'll drive them back as tame.

I judge that even the cheapest editions have a note explaining tinchel. The moral is, cultivate the habit of reading carefully, and read only books worth it. I am not claiming to be less guilty than other readers, but the same rule holds good all round: the best general is the one who makes the fewest

mistakes. I have given you examples of carelessness—misquotations in newspapers and magazines. I hope no one will find reason for saying "Physician, heal thyself!"

I was lucky enough to be at a school where the head master did not grudge the trouble of setting examination papers and looking over and correcting the mistakes and omissions, and I was lucky enough to go to the same college in the same year and term with one of the most wonderful men and scholars that ever lived—who possessed this power of verbal accuracy and of sifting all the wheat out of books as he read, and of rejecting the chaff and padding—I mean my late dear friend C. S. C.—Charles Stuart Calverley. He knew all the books he read. A good many of us at Christ's College, Cambridge, knew "Pickwick" specially well. Calverley said he would set us a paper, and see who knew it best. I was ill and could not go in. Here are two of the questions:—

1. Show that there were at least three times as many fiddles as harps in Muggleton at the time of the ball at Manor Farm.
2. Is there any ground for conjecturing that Sam Weller had more brothers than one?

The answers are that it is stated in the account of the ball that in a shady bower were the two best fiddles, and the only harp in all Muggleton. If there were two best there must have been a least a third, and therefore there were at least three times as many.

When Mr. Perker asked if he wasn't a wag, Sam said his eldest brother was troubled with that complaint. If he had an eldest brother he had more than one. Walter Besant did twenty-seven questions out of thirty.

Calverley's mind was like the trunk of an elephant, which will pick up a pin and tear up a tree by the roots. Do you cultivate the habit of attention? Remember that only that knowledge can be properly called so which can be produced ready for use instantly. Whether you are in the examination room or the House of Commons, you must be able to do without books. Every subject you study should be known as mathematics must be. One who knows any particular subject in mathematics can write out any piece of book work, or solve any reasonable rider or problem. Learn as many things as you can, and the most possible of each. Do not despise all smatterings; some smatterings are worse than useless; not so others. A smattering of Latin is useless; it is better to be able to speak French a little than not at all; it is better to know a little mathematics than none. Here comes in a little story I heard many years ago, showing the value of being able to speak French. When Lord Derby's Ministry was formed in 1852, he made Lord Malmesbury Foreign Secretary. Much surprise was expressed. He was not of Cabinet rank. A great many unfavourable criticisms were expressed. At last some one asked why Lord Derby had done it. The answer was, "He is the only Tory in the House of Peers who can speak French." It is wonderful what a lot a man can learn between seven and seventy—to say nothing of Premiers of eighty-three—besides attending to his daily business—by "redeeming his time." Take St. Paul's advice and redeem yours, remembering that the Greek *ἐξαρπαζόμενοι τὸν καιρὸν* means a great deal more, viz., making the best possible use of every opportunity—but this can only be done by never letting the ink in the pen get dry—by continual cultivation of the power of learning, and by following Bishop Butler's advice already referred to, not to let things pass through your mind rather than think of them. Don't talk of killing time—we have too little between our cradles and our graves—make the best use of it.

EDUCATION.

We now have cleared the ground and come to the question. What is Education? It is threefold: of body, mind, and spirit. That of the body comes first. Without health and strength, and the gaiety and lightness which come of a sound body, mind and spirit cannot be properly educated and cultivated. Begin at the beginning; games for boys, athletics for men. Cultivate every power, every muscle of the body—eye and hand, wind and limb—play cricket and football, run,

swim, row, fence, box, ride, shoot. Whatever thy hand findeth to do, do it with all thy might. I hope the day will come when every child will be taught music. Hear the wise words of Aristotle*: "Nature requires that we should work well and use leisure well. We should not be idle. How then can we employ our leisure? Not in mere frivolous amusement. Amusements should be the medicine of the soul by which we obtain rest. Music means intellectual enjoyment in leisure."

Now for the mind. Make the best possible use of every power. Store the armoury of your minds with every available weapon to fight the battle of life with. Learn by heart every good bit you come across, for use and comfort in old age. Do as that great and good man John Bright did: keep a commonplace-book, and copy into it every particular passage you wish to remember. It is no good buying books of "Extracts," or "Familiar Quotations," except for purposes of reference. Make your own. Remember Bacon: "Reading maketh a full man, conference a ready man, writing an exact man." Let us expand this. Students should mark, learn, and inwardly digest all they read. They should be examined *vice versa* to make them ready in using the knowledge they have acquired. They should be examined by examination papers, that they and their teachers may find out whether they really know what they have been reading or not. This must be done until they are accurate, terse, and exhaustive. He says also, "Historics make men wise; poets, witty; mathematics, subtle; natural philosophy, deep; moral, grave; logic and rhetoric, able to contend." This is a pretty wide field, especially as it takes a knowledge of classics for granted all through his "Essays"; but he surely did not expect all his readers to study all these subjects. But he as surely thought some might. The standard set is not an impossible one.

The study of natural science should come before all others. The works of God are better worth studying than the thoughts of men. First comes geography, now strangely neglected—taught at first by the globe and maps only—no books. Botany should be taught every year during the summer months; all children love flowers and pictures and what they call pretty things. Geology follows geography. Chemistry would follow in time. After these follow other branches of natural science. We are organic beings of flesh and blood, walking the surface of a planet in the solar system, surrounded by solid, liquid, and gaseous bodies, girt about with trees and shrubs and herbs and mosses, with beasts and birds and fishes and insects. On our knowledge of these, their laws and properties, depend our health, our happiness, our very existence.† Yet in most public schools natural sciences are boycotted or neglected, and classics spoken of as if our principal mission in this world was to learn them.

It is infuriating to think of the torture and misery inflicted on children in my childhood—given outrageous nonsense to learn by heart in Latin and Greek grammars, and caned if they did not remember the nonsense accurately. Then comes Number—what we generally call Arithmetic, the beginning of Mathematics. I hope you will all live to read in the original and enjoy the interesting praise of pure Mathematics you will find in Plato's Republic, and the equally curious paragraphs about Proportion in the Ethics of Aristotle. Then come Modern Languages, learned at first by the ear, and not by the eye. Hear what my friend Mr. Walter Besant, one of the best French scholars of the day, says in the early pages of his novel "All in a Garden Fair":—"The first thing you want with a language is the vocabulary; men who learn many languages begin after the manner of Adam—with the names, not after the manner of the schoolmasters—with the syntax. Those who do not want to learn a language begin with grammar and exercises; *this is the way of our schools*. Next, they learned how to connect the names with verbs and adjectives and things of that sort. Then they perceived that a certain amount of grammar was necessary. When their ears had caught the sound of the French language, when they had learned a copious vocabulary, and could read with pleasure and talk freely, though still with plenty of mistakes, their

* Jowett's Introduction to the Politics, p. xcl.
† Grant Allen.

teacher set them to write. They read a story one evening and wrote it down the next. Then they compared what they had written with what they had read, and were put to shame. It was necessary to find out many more things in the grammar. They found these out. Their teacher was a man of ideas and of clear mind. He wanted the boys to learn, not to pretend. He therefore made them teach themselves by an intelligent process, not by the conventional process. In two years they really knew French."

In his life of his friend Professor Palmer, Mr. Besant quotes Palmer's opinion of the foolish way of teaching French, persisted in in most, if not all, public schools.

Hear Lord Beaconsfield's opinion of the value of French ("Coningsby," chap. viii., book 4):—"The Marquis solemnly urged him not to neglect his French. A classical education was a very admirable thing, but there is a second education demanded by the world to which French is the key. When you enter into the world you will find that Greek and Latin are not so much diffused as you imagine."

Then the ancient or dead languages, which should not be begun until general intelligence has been developed. One of the most distinguished of Senior Classics—the wife of the Master of Trinity College, Cambridge—has proved that classics should not be begun too young.

In them you find the best thoughts of the most original thinkers, and mines of culture and knowledge and pleasure which will be a *κρηνα* *ἐς αἶν*—a possession to last your lives. In Aristotle, in Plato, in the Tragedians, in Thucydides, you will find that which makes all readers so much the better for what they read that it is hard on all who have to go without. Here again I say, Redeem your time. No history written since Thucydides wrote his is *simile aut secundum*. It has never been equalled. There is no second. There are other subjects of study, but they do not come in the curriculum of a school. I know that the way I have been pointing out is at present out of the question. So long as the English Universities and the schools which have arrogated to themselves the title of the public schools dictate what shall be done, and despise the teaching of the guides they pretend to follow, teachers must teach the learners what parents and guardians allow to be forced on them. The first problem of all, viz., shall education be directed towards

the acquisition of useful knowledge, or towards the study of those subjects alone which make up what is commonly called "culture," has been settled wrongly by them. It is clear that Education should do two things: (1) bring out, develop, and strengthen the powers of the mind, just as a proper course of training in games and athletics does the powers of the body, and (2) teach useful knowledge. Those who compel boys to spend nearly all their time on the study of dead languages, starve the second half, which is of far more importance to that great majority which, on reaching manhood, have to earn their own living, and want to be taught while boys that which will best enable them to do it.

There are one or two things you should be sure not to do. Read no bad books. In your allotted span of life you will not have time to read all the good and useful ones. Do nothing to weaken, to soften, to emasculate, to water down your power of mind. Use no crutches or pretended short cuts. Face your difficulties like men; look them straight in the face. There is no royal road to learning.

I come now to the last, and by far the most important—the education of your moral sense and conscience. Spiritual power is better than that of body and mind combined. The education of the body and mind rightly conducted lead to it. Spiritual power will help you to trample Satan under your feet; to fight successfully the lust of the flesh, the lust of the eye, and the pride of life, which three include all vice. They mean Sensuality, Avarice, and Pride, and cover the ground.

Study the Gospel story—in the Greek when you can—especially the Sermon on the Mount. Be brave as well as strong, brave enough to set a good example, to refuse to follow a bad one, to confess Christ before men. Vice may be pleasant, but remember that out of their pleasant vices boys and men make whips to scourge themselves. It has been said that "youth is a blunder, manhood a struggle, old age a regret." But the fewer the blunders of youth, the fewer the regrets of old age. The man, whether young, or middle-aged, or old, who could say on his death-bed, "I never told a lie, I never said or did anything unworthy of a gentleman, I never said or did when a boy anything I would not have said or done in my mother's presence," would be the happiest of the happy; his physical, mental, and moral education would have been perfect indeed.

THE GOUIN METHOD OF LEARNING LANGUAGES: ITS FUTURE PROSPECTS.

THE establishment of a central school of foreign tongues was announced last month to put in practice for the public in London the new method. Inquiries constantly arrive asking for information as to the future of the new educational movement, as to where qualified teachers can be obtained, whether lectures will be given in other towns than London, or in America, and so on. The following is the gist of what the promoters of the movement hope to do for its advancement during this next year.

The greatest need at the present time would seem to be a supply of fully trained teachers. This need has been only in part supplied by the training courses given up to the present. Those attending were for the most part natives or else English people speaking the language already well, and were also in nearly all cases already in positions of their own; so that, although more than 200 teachers have been trained in London and in Paris, there are still very few available for new openings. The movement having been widely taken up, has created a suitable opportunity for the consideration of an important question—that of the amelioration of the position or status of the modern language teacher, and especially that of the modern language governess. The governess, left to her own resources, often without scientific training in the practice of education, is subject to much difficulty in maintaining a recognised and

remunerative position. She is not always highly respected, for the simple reason that she cannot highly respect her own attainments. Granted a more accurate knowledge of psychological laws and of educational practice, the language mistress might take a position at least equal to that of private tutor, or of even higher professions. The status of teacher may be raised both by better training and by better organisation.

That this raising of status will come, every sign of the times now shows; and it will evidently be brought about by putting into the hands of its votaries a solid basis of scientific achievement for the carrying out of their duties. One great means to such an end will be the possession of a training in teaching which will enable them to achieve a well-determined result such as has been shown possible on the system perfected by M. Gouin. Not only for children will this result redound to the credit of the teachers, but also for business purposes. The stigma hitherto resting on Englishmen as being constitutionally bad linguists, and on the schools as being unable to teach languages usefully, will be swept away.

A LANGUAGE TRAINING SCHOOL.

It is evident then that the question of the training of teachers will continue for some time at least the principal one to be considered. France has already acknowledged this; and on the wide recognition in this country of the

importance of its principles, due greatly to the publicity given to the system in *THE REVIEW OF REVIEWS*, the Municipality of Paris has determined to establish a training school for language teachers, and has appointed M. Gouin director of an *Ecole Pratique des Langues Vivantes*, which is now being rapidly organised. There is little doubt, therefore, that in a very few years the schools of France will be equipped with thoroughly trained teachers able to produce results at least equal to those reported in our January number. England must not be behindhand. In a practical age every progress is tested and then utilised. The public require better teaching; the schools must supply it, and a thoroughly organised training school would seem to be a necessity.

The teachers who instruct in foreign languages may be divided into two great classes—foreign and English. The first consist of those who already know the language well, but are often sadly lacking in pedagogic science. The second comprise a few who are both well acquainted with the language and also with teaching; but still the greater proportion speak a little though not enough to teach properly by an oral method, even if the books were published. An adequate training school should, therefore, aim at giving not only training in teaching, but a thorough knowledge of the language to be taught as well. There is the intention of opening such a training school at the Central School of Foreign Tongues, at Howard House, in Arundel Street, Strand, under Messrs. H. Swan and V. Bétis—while M. Gouin is occupied with the similar enterprise in Paris. The courses for such a purpose would extend over one or two years, as the case may be; the latter for those who, not knowing a word of the language, wish to be able eventually to teach it. Students will learn two languages, usually French and German, thoroughly; and if there are twenty students entered the courses will be started, the fees being fifteen guineas a term. Such a course would embrace full personal training: first, as student, and then as teacher, and those who pass through it with success would be able to take both the oral and grammatical written language-teaching, and even the higher literature in a modern language class, if their later studies were fully carried out.

As might have been expected, the offers for trained teachers to adopt the system come mostly from private schools, and if in two years the private schools have adopted the method with the success it now seems to obtain, the public schools, always slow to take up the new ideas, will be forced to pay attention to the new advance in educational science.

ORIENTAL LANGUAGES.

Many persons have thought that the principles of Gouin apply only to European languages, but this does not seem to be the case, as expressly set forth by Gouin in his book. The principles are perfectly applicable to Oriental languages. These Oriental people see in their minds mental pictures, which, for them as for us, constitute the "meaning" of their words; *they* live a human life composed of a series of actions which can be expressed in sentences; *they* use intuitively, as we do, the power of the verb; they use the objective and the subjective language, and they associate their word-sounds with their thoughts, as we do; with them the word-signs (writing) are learnt after the sounds and the meaning are known, and they apply intuitively the laws of their grammar. Where is the impossibility of applying the method to Eastern languages?

At the training courses at the central school, specimens

have already been given in Slavonic and Oriental languages—Russian and Hungarian, for instance, and Burmese; and there would seem no need of spending much more time on these languages than on French or German. The children in those lands learn to speak in approximately the same time—none later than at four or five years of age. As French and German is taught at an hour a day in a year, so Hindustani or Arabic should be taught in a similar time.

The proof that the Series Method can be adapted to Oriental languages is already apparent. Letters have come from Turkey, Syria, India, and even Japan, stating that it has been tentatively adopted with success and pleasure.

TEACHING ENGLISH IN INDIA.

But, for Englishmen, perhaps, after their own and their neighbours' languages, those of the natives of India are the most interesting. A problem which has long troubled our authorities in India is a double one—not only is the means required to teach the native languages to English residents, but more especially to implant English in India alongside the native tongues. This has been extremely difficult to accomplish by the old methods of teaching with grammar and vocabulary, and several native correspondents have written urging the speedy introduction of the new method into native schools. The establishment of a training school in London may enable this great problem to be solved successfully. English persons intending to go to India, and desirous of adopting the method, might first obtain the training required, if courses in Hindustani—Urdu, Tamil, etc.—(or equally Persian and Arabic) were there given. But before establishing such courses it would be necessary to know how many would join; and there would evidently be an opening for an intelligent Hindoo, knowing how to teach, and willing to adapt himself to new methods, to carry on such a class. In this way it would be possible to thoroughly train teachers, who could at once introduce the method for teaching English successfully in native colleges.

FUTURE ARRANGEMENTS.

The holiday courses in London will be continued, the next one being for ten days at Christmas, December 27th to January 6th. Messrs. Swan and Bétis will visit the North of England and Edinburgh early next year to give a course of lectures to teachers; and for the sake of American correspondents it may be mentioned that it is expected that arrangements will be made to visit Boston, New York, and Toronto, etc., in the early summer of next year, to give similar courses to teachers, and to establish schools on the model of the London Central School of Tongues.

As questions continue to arrive as to the books on the Series Method, it may be well to mention that a second work by M. Gouin, entitled "A First Lesson," will be published in England and America this month, to be followed by other practical works.

The first portion—text and French grammar chart—and a comprehensive work entitled "Universal Symbolic Grammar," by Messrs. Bétis and Swan, is also announced for publication. This work is an attempt to change entirely the ideas of linguists and language masters relative to the grammar—its psychological basis and the manner of teaching. It will comprise symbolic grammar charts in the various languages on entirely novel lines, and is a book of transition between the ideas at present received and those set forth by M. Gouin. At the same time this work, when finished, will eventually form (so at least the authors hope) a complete and practical collection in symbolic form of the grammatical laws governing all languages, ancient or modern.

THE CHRONICLES OF THE CIVIC CHURCH.

THE WASTED WEALTH OF KING DEMOS.

HISTORY.

A CANADIAN correspondent sends me the following interesting account of the way in which in Montreal the historic associations of the city are saved from wasting by a very simple expedient, which we might well adopt:—

Montreal, which is the premier city of Canada, is, in many ways, inferior to the great metropolis and the larger cities of England, but it is nevertheless in advance of every one of them in this respect. It might very fairly be said to set a good example to the world. Every house or place which can by any stretch of fancy be said to have any historical significance is plainly notified to the public by a marble tablet on the spot with suitable inscription. One would at first imagine there were peculiar difficulties in the way of doing this in a city like Montreal. Montreal is made up of a mixed population of nearly a quarter of a million, three-fourths French and one-fourth English or Canadian. So that historical events must of necessity cut two ways on either side. Take, for instance, the founding of Canada. It is not pleasant for an Englishman to see written up before his eyes, in his own language, in the city and country which he claims to govern, that his rival in said city was the founder. There is a peculiar piquancy to this when the preponderance of French population is remembered; and still more so when it is remembered that, rightly or wrongly, the French population are not regarded with the utmost complacency by the English portion of the people.

This aside, there is the clear fact to record—account for it how we will—that all the places of public or private interest, French or English, in Montreal, are written up for the public gaze.

Montreal, as is pretty generally known, abounds in magnificent Roman Catholic institutions. The great bulk of the population—that is, the French portion—look to the ministrations of that Church. It is the minority—the English-speaking portion—which are the Protestants, although in the main they control the commerce and are the governing body. This does not apply in the case of Quebec, where the governing body is both Catholic and French, the English and Protestant element being scarcely one-tenth of the entire population.

Take for an instance of what we have already referred to, the following tablet, which is affixed to a block of buildings almost adjoining the Custom House and facing the landing-stage on the river (St. Lawrence):—

"This spot was selected and named in 1611 'La Place Royale' by Samuel de Champlain, 'The Founder of Canada.'"

Side by side with this notice, separated only by a window, is another equally significant:—

"Near this spot on the eighteenth day of May, 1642, Landed the founders of Montreal, Commanded by Paul de Chomedy, Sieur de Maisonneuve. Their first proceeding was a religious service."

At about half a mile away, lower down the river, but separate from it by one or two streets, stands a monument of Nelson, England's great sea king, who was one of the mightiest factors in destroying the power of the French in the early part of the century. It is true this monument seems to be somewhat neglected—it is dirty, and in some places badly in need of repair—but it stands there all the same a witness to England's strength and England's glory. It was erected only three years after the great sea king's death, and gives in bas-relief some

scenic representations of his great battles, including the greatest of all—Trafalgar. It is not a very imposing structure, however; rather the reverse.

Not far from this, scarcely a stone's throw, is the Notre Dame Cathedral, and almost opposite the Cathedral, off a side street is the following interesting notice:—

"Here stood the first synagogue, built in Canada; erected in 1777, A. M. 5537, by the Spanish and Portuguese Jewish Congregation (Shearith Israel), founded 1768, A. M. 5528."

A few steps farther on you come across another witness eloquent in its silence, but from which evidently the glory has long since departed. In fact, the first Protestant church of Lower Canada is now used for storage, and the walls are enlivened with playbills:—

"St. Gabriel's Church, the first Protestant Church, Montreal, 1792."

Contrast this with the little Catholic chapel which stands just off Notre Dame Street, a little higher up than the Cathedral, and which, like all the R. C. churches, but unlike the Protestant churches, is always kept open during the day for inspection or devotion:—

"Commencée 1657; incendiée 1754; reconstruite 1772; restaurée 1888."

Leaving religious subjects, a spot interesting to Americans is marked by a tablet, as follows:—

"In 1694 here stood the house of Lamothe Cadillac, founder of Detroit."

Or in another part of the city which seems to bring up the famous John Frobisher, of North-West Passage fame, although said famous Frobisher must have been an ancestor a good way back:—

"Here stood Beaver Hall, built 1800, burnt 1848, the mansion of John Frobisher, one of the founders of the North West Company which made Montreal for years the fur-trading centre of America."

Just one other instance to show the wide ground covered by the society which undertakes this little public duty:—

"Here lived René Robert Cavelier, Sieur de la Salle, 1668."

Although not exactly in the same historic line of things as the events above described, mention might perhaps be made of the R. C. representation of the Via Dolorosa in the cemetery on the Mount. The Way of the Cross is divided into fourteen stations, commencing with the stripping off the garments of Jesus, and finishing with the Grave. The stations wind in and out the road that gradually leads to the summit of the hill. Some of the pictures (in stone or metal) are exceedingly expensive, especially the one where one of the women comes forward to wipe the sweat off the brow of Jesus, as He almost faints under the load of the Cross. The scene which shows Jesus fallen beneath the load, and looking up with a face full of supplication and resignation, is very affecting. The coupling of women and angels throughout the whole series, with the men left out altogether or left in the background, save the One Man who stands there alone in ineffable sorrow, is very strong and very moving.

"THE CORRESPONDENCE CHURCH."

In the article on this subject which I published in the last issue of the magazine, a mistake was made in the name of the clergyman from whom the suggestion of a "Correspondence Church" originally emanated. Instead of saying the Rev. Standen Holden, I should have said the Rev. Holden Sampson, of Belstone, Redhill, Surrey.

UTILISING THE POLICE.

I AM glad to see that the movement begun in Edinburgh for utilising the police is spreading throughout the country. At Wolverhampton, on October 2, a public meeting was held in the town hall, the Mayor in the chair, when it was unanimously decided to form a Society for Clothing Destitute Children, and contributions amounting to £100 were promised in the room. The Mayor, in opening the subject, after describing the evils of the existing system, by which children were allowed to go half-naked, said:—

If they could mitigate an evil such as that, surely it was worth an effort, and it should be the duty—he might say, the pleasure—of those who were in happy circumstances to lend a helping hand to their poorer brethren. There were and had been many societies with similar objects in view, among others in this town the Ladies' Needlework Guild, but he took it that none of them had been able to prevent the abuse of the gifts of clothing, and it was only too sure that clothes given in charity had sooner or later found their way into the pawnshop, in many instances pledged for a mere pittance, and probably seldom or never redeemed. They had now the means ready to hand to prevent that abuse, viz.:—the police. The duties of the police brought them into conflict with many of the inhabitants of this borough, and if they could give the constabulary an opportunity of doing these poor people a good turn, they would put them in the position of being in closer sympathy with this class, and let them hope, minimise their work in their future. He had read an article in *THE REVIEW OF REVIEWS* on the system which he now proposed, and which had been in force in Edinburgh for some time, and in regard thereto had consulted Captain Burnett (Chief Constable), the chairman of the Watch Committee, and several inspectors and policemen. He was very glad to say they had tumbled to the idea at once. It had been suggested to him that the proper persons to work a scheme like this were the School Board officers, but it occurred to him (the mayor) that the police would be able to render more efficient service, for they were at all times amongst the poor, and more frequently brought into contact with the wretched conditions of the courts and alleys. In addition to the assistance rendered by the police, the officer for the local branch of the National Society for the Prevention of Cruelty to Children would give what aid he could.

The Rev. C. A. Berry, in seconding the resolution, said it appeared to him that this society filled a real gap in their social system, whilst it did not interfere with the admirable work carried on by the Society for the Prevention of Cruelty to Children. The latter was a preventive society; the proposed one would be a positive and immediate benefit to the children. The scheme was undertaken from very thoughtful motives, and would remove the real difficulties which most people felt in helping the poor. He thought the mayor was right in insisting that the police should have practical charge of this movement rather than any other body. Whilst the carrying out of the charity would still further harmonise the relations between the police and the people, it would also have a reflex influence on the police themselves. It was no easy thing for an ordinary man to maintain his faith in human nature, but with the police it must have such an effect on his own mind and character. The general public could not undertake such a work without being benefited themselves. It seemed to him that those present were at a school of civic education, and were learning how to found society on a better basis, and to bring classes together in more close and mutual helpfulness. This scheme conferred a great boon on the community.

"THE GUILD OF THE COMMONWEAL"

THE CIVIC MISSION OF THE ANGLICAN CHURCH.

MR. P. LYTTELTON GELL, at the Church Congress, Birmingham, last month, read an admirable paper on "The Civic Mission of the National Church in Regard to the Homes of the Working Classes." It is an eloquent argument, pleading that the clergyman should always be the head of the Civic Church:—

The subject on which I have been asked to address the Church Congress is in itself a recognition of the fact that the National Church of England is not only a spiritual communion but a Civic agency, and has duties and responsibilities apart from the conduct of public worship and the religious instruction of its members.

It is therefore in discharge of a fundamental obligation of our faith that the parochial organisation of the Church of England places every acre of land, every cottage, and every individual, from one end of England to the other, under the cognisance of a consecrated and responsible officer, who is bound not only to minister in spiritual things to every soul that does not actually decline his offices, but also to discharge certain specified, and many unspecified, secular or civic duties; and in particular, as the traditional chairman of the parish vestry-meeting, he is designated as the natural leader of his people in all that is for the common good of his parish.

The civic responsibilities of the Church fall upon the workaday laity in each parish, and must be discharged by them; but how shall they learn without a teacher? or combine without a leader? And by the laity I do not mean merely the squires and the upper-middle classes, who, in my experience, are not always the easiest to move and the most liberal of their time and trouble, but the rank-and-file of the parish: not the social crust on the surface, but "the nation that dwells in its cottages." No one who knows the lower-middle and working classes nowadays can be oblivious to the immense civic capacities which exist among them.

These gifts are the very A B C of every Nonconformist leader, of every trades-organiser, of every political wire-puller, and wherever the clergy cannot cordially and adequately appreciate the qualities and the claims of the working-class laity, I fear the Church will find itself left outside the main local currents of our national life.

THE CALL TO EVERY MINISTER.

To every minister who, perhaps already overburdened, shrinks from extending the battlefield of his combat with evil in his parish, the voice of the vigorous democracy seems, to my ear, to cry aloud, "I will give thee two thousand horses if thou be able, on thy part, to set riders upon them."

The point I desire to urge is that, in acquiescing in the assumption by the State of many burdens connected with the homes of the wage-earners, which have in earlier days often rested on the shoulders of the clergy alone, the clergy should not relinquish an iota of their interest in them, nor a title of their sense of responsibility. If, therefore, the traditional work of the Church is thus to be reinforced by civic resources, surely the clergy should all the more tenaciously pursue that work through the new channels of civic machinery. All that is best in this movement represents the ascendancy of Christian ideas over the public conscience—for, in the words of Mrs. Browning, "Civilization perfected is fully developed Christianity."

Let us consider the enormous range of the problems opened up in any parish in connection with the homes of the working classes, and note how far they have been of late years claimed for the province of civic or communal administration.

They fall into three classes:—*First*—Christian responsibilities now directly assumed by the community. *Second*—Christian responsibilities partially or irregularly assumed by the community. *Third*—Christian responsibilities still directly incumbent on the National Church.

THE CHURCH AND COMMUNAL BODIES.

As regards the first class, wherever a local sanitary authority can be aroused to assume the statutory powers now conferred

upon it, the community can deal with the whole question of decent housing and effective sanitation.

Who cannot perceive the necessity of a force which, standing outside the "big-enders" and "little-enders" of municipal and rural politics, shall keep an eye open solely to the common weal, and an ear alert to catch the timid appeal of the poor?

There, in my belief, lies the function especially falling upon the Church in this sphere of State action. We must neither compete with the communal machinery, nor hold aloof from it, but endeavour to increase its effectiveness, and inspire it with Christian ideals, more especially in view of the imminent completion of our fabric of local self-government by district and parish councils.

Who has such an opportunity as the clergyman for kindling that healthy public opinion and criticism which in the long run is the only guarantee of good official work? He need not necessarily spend his own time upon the Boards to which such responsibilities are entrusted. I would see the clergyman in every parish at the head of what we might call a "Guild of the Commonweal," including both men and women, drawn from all classes, federated with similar guilds in adjacent parishes, and sub-divided in large districts, for whom instruction in the provisions of the law—Metropolitan, provincial, or rural, as the case might demand—would be provided by classes or lectures, and who would be the source from which all necessary initiative should proceed. It should be a leading object with a parish clergyman to get his laity taught their civic responsibilities as Christians. And that he might be qualified to lead them, the requisite points of municipal law should be studied in theological colleges, as medicine often is in missionary colleges; while in every Rural Deanery some leading layman might be secured—if possible, a lawyer or a doctor—who would act as referee whenever information or advice is required.

SPIRITUAL WATCHDOGS NEEDED.

Further, it is of the utmost importance that State regulations should be humanised, moderated, and, where necessary, supplemented. The workhouse master, the parish doctor, the inspector of nuisances, the relieving officer, the elementary schoolmaster, may do their work formally, but it will make all the difference whether they, the officials of the nation's philanthropy, do it as drill-sergeants, or as the representatives of a Christian and sympathetic spirit in the community. The influence of the Church, working through its Guild of the Commonweal, ought surely to be exercised—first, to compel the local authorities to administer the law energetically; next, to re-inforce the official sources of information; thirdly, to watch carefully the spirit in which the work of all officials is carried out; and, beyond this, to supplement, by the methods of individual helpfulness and charity, the hard and fast limits of official action. In all these directions, though the help of the well-to-do is invaluable, the help of the working man and working woman will be found more valuable still.

Let us pass on to consider our second class of Church work—Christian responsibilities partially or irregularly assumed by the community. Chief amongst these comes education, the relief of the poor, the sick, and aged in their own homes, under circumstances which would render the rigid intervention offered by the State unfeeling and even cruel, and, above all, the immense sphere of administration connected with the health of the homes in which the State has still left all initiative to voluntary action.

WANTED, ANGLICAN LAY PREACHERS.

The responsibility for the religious education of the wage-earner's children marks the dividing line between the second and third class of duties which we have indicated. Could not our parochial organisation habitually enlist the services of men corresponding to the local preachers in the Methodist communion?—men of the people, conscious of a message to their fellow-men, pursuing their daily avocations and not in full orders, yet recognised as preachers and teachers by the Church? Surely an adjunct of every parish church, with its full services conducted by fully ordained clergy, should be one or more mission rooms, where freer forms of service should be adopted, and where the lay deacons would find their sphere of defined and honourable responsibility; the value of such men as links with working-class feelings would be incal-

culable, and the mission room would become the natural centre of the parish or district "Guild of the Commonweal."

In conclusion, I would point out that so long as the principle of an Established Church is maintained in England, so long that Church must be regarded as the national organisation responsible for the whole sphere of Christian obligations of which it has not been positively relieved by legislation, and so long they cannot be ignored in any parish without an absolute dereliction of duty and an unfaithfulness to the Church of which it forms a part. These duties are not of choice, as in a voluntary organisation, but of positive obligation. I venture to believe that if this responsibility be recognised, if the Church be prompt to claim its place in the new social fabric, we are at the opening of a new chapter in its long and beneficent history.

If this view be correct, there could not be a more vital problem for the Church, as a whole, and in its parishes, than to recognise the situation, and zealously adjust its energies to harmonise with the movement of the day. Our Church, as an Establishment, territorially localised, is a monumental legacy of an age when society was effectively and almost exhaustively organised, whether for spiritual, industrial, military, or administrative purposes. It has held its ground through the epoch of disintegration and demolition. Now that we are again on the threshold of a constructive epoch, based upon the recognition of the brotherhood of men, let the Church claim its fitting place as a contributor to the new fabric!

Shutting Children out of School Playgrounds.

LORD MEATH sends me the following letter which he has received from Cardiff, illustrating the need for action on this subject:—

A few gentlemen in this town have been endeavouring for some years to induce the School Board to throw open their playgrounds on Saturdays and after school hours every day, and I am sorry to have to say without success. When I tell your lordship that the elementary schools of Cardiff provide accommodation for twenty thousand children you will, I am sure, agree with us in thinking that the Board (most of whose schools have extensive grounds) have shown little regard for the physical welfare of the children committed to their care. Through the liberality of a few public-spirited gentlemen we fitted up three school yards with gymnastic appliances—and as long as we were able to afford to pay the caretaker for his additional labour the Board allowed these grounds to be used after school hours; when, however, our fund came to an end, and we handed the apparatus over to the custody of the Board, they at once had the playgrounds closed, and so they have remained to the present time. I am writing in despair to know whether your lordship could suggest any means of bringing further pressure to bear on the Cardiff School Board.

Education in Paris.

In these days of higher education and frequent communication with the Continent, English and American parents are naturally desirous of procuring for their daughters such proficiency in the French language as cannot possibly be attained in England. They dislike to send their daughters abroad to convents, and they have great difficulty in finding suitable families. It may therefore be a service to some of my readers if I state that Madame Duchemin, wife of the pastor of Neuilly, is willing to take some English pupils. She lives in a large airy house with garden. Her daughter, who has passed the highest State examinations, gives instruction in the French language and literature; the best teaching in music and painting can be easily obtained. This house offers the highest educational advantages, together with cheerfulness and a Christian home. I can thoroughly recommend it. Madame Duchemin, 50 bis, rue Peronnet, Neuilly, Paris, who, by the way, is a daughter of the well-known Protestant historian, Dr. Merle D'Aubigné, will be glad to answer any inquiries.

TEACHING THE PEOPLE SOCIAL SCIENCE.

A NOBLE EXAMPLE SET BY THE CATHOLIC CHURCH.

THE *Catholic World* for September describes two developments of the University Extension movement, one in the Old World and one in the New, both under Catholic auspices. Mr. John J. O'Shea glowingly dilates upon the success of the recent Summer School at Lake Champlain. To the criticism "It is only a copy of Chautauqua," he retorts, "Be it so: Chautauqua is only a copy of Oxford and Cambridge. . . . It is to the old Catholic Church that the world owes the first university."

A much more praiseworthy and admirable movement is the "People's University," which met for the first time in September of last year. It is described by Mr. Joseph H. McMahon as—

an innovation introduced for the benefit of the German Catholics by the Catholic *Volksverein*, or People's Association. . . . The plan of the *Volksverein* was to organise in different parts of the German Empire periodical courses in social and economic science. . . . Warned by the terrible mistakes made by socialists in social science in their endeavours, without sufficient knowledge of correct principles, to find practical answers to social difficulties, the German Catholics with prudent forethought have long been instructing the people in sound principles of social and political economy. The labour question, the land question, the question of syndicates and trades-unions, the social question in relation to Christianity, the struggle of socialism and the church, have all been dealt with, in the clearest, most practical and learned manner in a series of popular treatises prepared by some of the most celebrated students of political economy and sociology of the age, under the able direction and with the enthusiastic encouragement of the noble Bishop Kettler.

The aim of the course of study was to rouse interest in sociology and to show how the clergy and other members of the leading class should help in solving social problems, to connect the various problems and to expound the true principles of labour legislation, to suggest further lines of study, and to give lists of suitable books.

A LABOUR CIVIC CHURCH.

The place was München-Gladbach, a busy centre of cotton manufacture in Rhenish Prussia, and a sort of Mecca of modern Catholic sociology—

famous in Catholic Germany for the number, variety, and completeness of its institutions for the labouring classes, and its social works of every kind. Here, in 1889, Abbé Hitze founded the powerful organisation known as *Arbeiterwohl*—"The Commonweal of Workmen." . . . It busies itself with the formation, organisation, direction of working-men's associations; working-men's institutions, such as savings banks of all kinds; the internal arrangement of factories; their ventilation and heating; the separation of the sexes in mills; the question of the housing of labourers; the question of drunkenness; schools for housekeepers; legislation looking to the protection of workmen. Such questions as these are thoroughly ventilated in the organ of the union, appearing monthly under the same name. . . . München-Gladbach is also the seat of the Catholic *Volksverein*. . . . It contains moreover a specimen of almost all the institutions whose object is the amelioration of the condition of the working classes. The Catholics of this town have in advance demonstrated in reality all the reforms and improvements contemplated by recent labour legislation in Germany. Every family, for the most part, has a separate dwelling, kept with the greatest care. In most of the factories women are not allowed to work after marriage.

The session ran from the 20th to the 30th of

September. The students numbered six hundred, coming from a dozen different States. Three lectures in the morning, visits to the social institutions of the town in the afternoon, discussion on some mooted point and social amusement in the evening made up the day's work.

When will Anglicanism or Nonconformity do for Manchester what Romanism has done for this Rhenish Cottonopolis?

OUR LANTERN DEPARTMENT.

REFERRING to the proposed scheme of lectures mentioned in the August number of *THE REVIEW OF REVIEWS*, the following sets are ready for delivery:—

- "Emanuel Swedenborg."
- "Reunion at Grindelwald."
- "Christianising Central Africa."
- "Oberammergau Passion Play."
- "Joan of Arc."
- "Life of Jean Baptiste de la Salle."
- "Be a Christ."

Others are in preparation, including "Lucerne," "Rome," "Romola," "Temperance Work of To-day," and a lecture by Professor W. Hall Griffin. A scheme of interchange is being tried, and I shall be very glad if those who possess lantern slides will communicate with the Secretary, 18, Pall Mall East.—Messrs. Peek, Frean, and Co. inform me that they are giving away slides suitable for intervals.

Mr. G. Robinson Lees, F.R.G.S., sends me the first English illustrated book ever printed and published in Jerusalem. It is entitled "Bible Scenes from the Holy Land," and contains 12 ½-plate photographs illustrating Bible texts by giving views taken from life of the native inhabitants of the Holy Land. There is a brief descriptive letterpress. It is published in cloth at 6s., post free, and in olive wood covers at 8s. 6d., by the London Jews Society's House of Industry, Jerusalem. Orders should be sent to Mr. Albert Singer, Jerusalem.

Notable Reunion at Pittsburgh, U.S.A.

"A FREE Church for America" is the plea of Mr. W. P. Mackenzie in the October *Arena*. He finds the secret of disunion in the fact that "thinking and not doing is emphasised in Church associations," and he asks—

Is there a church not based on creed, but aiming simply to manifest the spirit Christ asked for in His parable of the last judgment? Is there one united by a sentiment thus? . . . Only for such as have been converted and "become as little children" has a free church room, but it has room for all of these. It may well have many divisions; it will have but the one work—the regeneration of humanity. . . . The church will be home for the friendless and school for the ignorant; a place also for those who want not help but sympathy, the love that "restores the intuition" to the discouraged.

Here is the fact which gives ground to the hope:—

At Pittsburgh, in the "east end," has been given a practical example of union in work; twenty churches acknowledging that they are comrades, as soldiers in a war; making actually a "war-map" of the district, and assigning to each corps of labourers a part; a Presbyterian minister and a Roman Catholic priest working shoulder to shoulder as the captains of salvation for one division or parish.

No wonder Mr. Mackenzie proceeds:—

In the sixteenth century there was the disruption of Christendom; let us hope that even in this century we are to see the reunion of Christendom. Seers have looked to America as the meeting ground for men, the place where brotherhood is to be recognised.

FREE LITERATURE SOCIETY.

THE Kyrle Society, whose good work in promoting all that tends to humanise the people is not so widely known as it deserves, desires me to say that they have for years past undertaken the collection and distribution of literature to various public institutions. The Kyrle Societies of Dublin and Nottingham make this a branch of their work. From the central society, whose address is (T. Slingsby Tanner, Secretary) 49, Manchester Street, W., they send out every year about two thousand books, two thousand magazines, and three thousand newspapers. Parish libraries, working men's clubs, girls' friendly clubs, the United Society of London Firemen, libraries in connection with Board Schools, missions to seamen and others, nurses' associations, and hospitals for children, have, among others, benefited by grants from this branch. As at present the Free Literature Society necessarily confines its attention to workhouses, other applicants had better apply to the Kyrle Society.

The secretary of our Edinburgh Helpers' Association, Miss Josephine Marshall, established a magazine depot of the Association for Improving the Condition of the Poor at the King Stable's Road, Grassmarket. From an *ad interim* report I take the following information:—Parcels have been supplied weekly to the City Hospital, St. Cuthbert's Poorhouse and Craiglockhart Poorhouse, and, more or less frequently, to the Night Asylum, Magdalene Asylum, Gorgie; The Laundry, Castle Lodging House; Boys' Brigade, Grove Street; Seaman's Reading Room, Leith; Soldiers' Home, Piershill, Hospital for Incurables. A box has been placed, by the kind permission of the authorities, in the Caledonian Station, from which a fair supply is collected twice a week. Contributions of Christmas cards and pictures are also most acceptable. The cards and small pictures are made up into cloth scrap-books, and distributed among the various children's institutions, where the supply falls far short of the demand. Large pictures, such as Christmas supplements and illuminated texts, are pasted on cardboard, varnished, and sent to brighten the wards of our hospitals and poorhouses.

THANKS.

We have to acknowledge with many thanks promises of regular monthly contributions of back numbers from the following publishers:—

<i>Chips Newspaper</i>	Fleet Street, E.C.
<i>Christian Million</i>	20 and 22, St. Bride Street, E.C.
Clark and Co., James	13 and 14, Fleet Street, E.C.
<i>Comic Cuts</i>	Fleet Street, E.C.
<i>Dundee Advertiser</i>	<i>People's Friend</i> , Fleet Street, E.C.
<i>Fun Newspaper</i>	153, Fleet Street, E.C.
<i>Gentleman</i>	Howard House, Arundel Street, Strand.
Haddon and Co.	Bouverie House, Salisbury Square, E.C.
<i>Housewife</i>	20 and 22, St. Bride Street, E.C.
Lunn, Dr.	<i>Review of the Churches</i> .
<i>Methodist Times</i>	Fleet Street, E.C.
Newnes (Ltd.), Geo.	Southampton Street, W.C.
<i>Pearson's Weekly</i>	Temple Chambers, E.C.
<i>Record Press</i>	376, Strand.

Smith and Co., Thos.	<i>Great Thoughts</i> , Hutton Street.
<i> Vulcan</i>	Leeds.

An "Amateur Domestic."

"In Cap and Apron: Two Weeks in Service," is the title of a series of articles appearing in the *Sunday Sun*. The enterprising lady journalist, Miss Elizabeth Banks—who is the writer—has succeeded in acquiring a practical

knowledge of the problems of domestic service from the side that is not so vocal as that of the mistress. In the first two numbers as yet published she graphically recounts the varied experiences she went through in obtaining the situation. Subsequent issues are to tell her actual experience when cap and apron have been donned. These developments of amateurism are multiplying. The amateur casual, the amateur tramp, the amateur tram conductor, have not told their experiences in vain. The reflection suggests itself—Are we prepared to let members of the so-called lower classes play at our vocations as we play at theirs? What would happen to the casual or tramp who was found out trying to pass himself off as a journalist or sociologist, or member of Parliament?

Sporting Prophets Exposed by a Parson.

REV. J. W. HORSLEY tells in the *New Review* how a desire to save some young friends from a blind faith in "Our Sporting Zadkiels" led him to make a detailed comparison of their prophecies with the actual event. He took the selections of seven prophets for eleven races at Newmarket, and found that "in six out of eleven races all the prophecies of all the prophets were wrong. In three cases one prophet only was right, and in one case two were right."

Out of nine days' prophecies in a halfpenny morning paper there was a total of sixty-six failures to eighteen successes. Out of six days' prophecies in an evening paper there were twelve successes to thirty-three failures. A purely sporting paper yielded a total of nine successes to thirty-three failures. Mr. Horsley adds page after page of similar statistics, and boldly gives the names and dates of the papers, races, and prophets; so that the sceptical youth who distrusts the clergyman can verify the figures for himself. The Anti-Gambling Society would do well to get this article reprinted and scattered broadcast among boys and young men.

Lady Henry Somerset's Idea of a Christian.

IN the *Young Woman* Lady Henry Somerset essays to answer the question, "What is it to be a Christian?"

The word Christian means a Christ-man, therefore a Christ-woman. . . . The fundamental idea of a Christian is, I venture to think, therefore, not fully expressed by the phrase a "follower of Christ." "I am a Christ because His divine life exists in me," seems to be a higher, clearer vision of the truth.

To be a Christian means to count oneself in and not out when any new adaptation of Christianity presents itself, and make its appeal to hearts ripened in the sunshine of God to a tenderness that renders them responsive to every need of human brotherhood. It means to despise no smallest opportunity to make the way of life safer and better for all about us.

To women the call of opportunity comes in this kindly age as never hitherto. They are no longer gleaners, but strong-armed harvesters in the white fields of God.

PRIZE CALENDAR FOR SEPTEMBER.

THE prize is won this month by—

1. Miss Cécile Lambert, 27, Blenheim Crescent, W.

The next seven best follow in order of merit:—

2. W. Culling Gaze, Fengate, Peterborough.

3. C. D. Rosling, Horwell Endowed School, St. Stephens-by-Launceston.

4. Miss Elise le Huquet, Greencliff, St. Martin's, Jersey

5. Miss S. C. M. Holmes, Southfield, Leominster.

6. Charles Scott, 4, Dalfield Walk, Dundee.

7. "Veritas," 3, Avoca Terrace, Blackrock, Dublin.

8. George W. Wright, Ings Road, Barton-on-Humber.

THE DEVIL-FISH OF TO-DAY.

"TWO AND TWO MAKE FOUR."

A CHRISTMAS STORY FOR THE TIMES.

A CASUAL observer looking at the outside of the Christmas Number of *THE REVIEW OF REVIEWS* might mistake it for a schoolboy's slate. It contains no lettering of any kind. It is as like a school slate as the lithographers can make it. On the wooden edge of the slate is printed the name of the author, while the title consists simply of three figures:—

2
2
—
4

"Two and Two Make Four: A Story for the Times," is based upon the *Liberator* crash; and this leads up to the description of the *Daily Paper*, of which Mr. Stead has dreamed so long. Whether in its history or in its prophecy, it is a story which is certain to be so hotly discussed that it may be well to give an outline of the tale, which is unique among the Christmas publications of the year.

THE DEVIL-FISH OF TO-DAY.

"Two and Two Make Four" is divided into three parts. The first is devoted to the crash of the *Liberator*, the second describes how the financial catastrophe led up to the foundation of the *Daily Paper*, while the third, which is supposed to be laid in the year 1900, is devoted to a gorgeous description of the wonderful things which are supposed to have been brought about in the next six years by the combined agency of the *Daily Paper* and a Fellowship founded under its auspices. The frontispiece, to a certain extent, gives the keynote of the whole of the story. It represents Spencer Balfour, who is at present sunning himself in South America, out of the reach of Extradition Treaties, as a devil-fish or octopus, in whose grasp the luckless British investor is struggling for life. The motto is taken from Molière, whose graceless hero, Don Juan, declares that his only religion is that two and two make four. The author's point is that even this rudimentary religion has lost its hold on the public, and that if confidence is to be re-established, we must take our stand upon the fundamental principle that two and two make four, and cannot, by any process of lying, be made to make three or five.

THE LIBERATOR AND ITS ROGUES.

The story opens on Christmas Eve of the year 1892, when an Oxford undergraduate is making his way on a visit to Mr. Dodds of Streatham, who is easily recognised as Mr. Hobbs of the *Liberator*. The story, however, opens when Mr. Dodds, of the *Emancipator*, is still figuring as a leading light in the Baptist church of South London; but the toils are closing round him, and Christmas finds him full of horrible alarm. A fortunate adventure, by which his young visitor, Dick Grant, was instrumental in saving the life of Nedelca, the only daughter of Lady Sidney Nestor, the titled wife of an American millionaire, fills him with a hope that he may, as a last stroke, secure the prestige of Mr. Nestor's millions in order to postpone the impending crash of the *Emancipator*. There is no attempt to follow with minute accuracy the final struggles of that great thievish confederacy, but the outlines are followed sufficiently

close to enable any one to understand the nature of the desperate game which was played by Spencer Balfour and his confederates. In order to secure the support of Mr. Nestor, Mr. Spencer—for that is the pseudonym under which Mr. Jabez Spencer Balfour is described—appoints Dick as his private secretary. Mr. Dodds endeavours to get the support of Mr. Nestor for the society, the secretary of whose vice-president had saved his daughter from a bloody death. Mr. Nestor, however, refuses to be drawn, and the rogues are thrown back on their own resources, which were rapidly running dry.

HOW IT WAS WORKED.

Dick's father, a minister in the South of Wales, is made the unconscious tool of the *Emancipator* gang. In a couple of chapters we have pictures, more or less drawn from life, showing how helpless is the honest investor, and how difficult it is for him to learn the truth about public companies. Dick's aunt has £500, taken from the local building society for fear of its insolvency, hidden in her mangle, while she in vain endeavours to try and find trustworthy guidance as to the best place in which to invest it. At length she writes to the local editor, who in turn writes to his member, who, being of the guinea-pig description, is easily induced by Dodds to give a certificate of solvency for the *Emancipator*, which even at that moment is tottering to its fall. Mr. Jeremy, the *Emancipator* agent, quickly has the widow in his toils. The £500 is soon on its way up to London, minus the agent's commission.

BURNLEY ELECTION, 1892.

The General Election approaches, and Mr. Spencer summons Dick Grant to help him when seeking re-election for his Lancashire constituency. On the eve of the election, however, a letter not marked private arrives from Dodds, describing how Mr. Nestor had been killed in endeavouring to stop a runaway horse on the Embankment opposite Cleopatra's Needle. Dodds exults that vengeance has overtaken the millionaire for his base ingratitude in not rescuing the *Emancipator* from its impending doom. The letter informs Grant for the first time of the attempt which had been made to exploit his act for the benefit of the society. An angry scene follows, at the close of which he is flung downstairs by Spencer, and picked up unconscious; nor is he able to go about until the election is over, and Spencer is back again in town receiving the congratulations of his friends and admirers. Then comes the crash.

THE CRASH AND ITS SEQUEL.

The doors of the *Emancipator* are closed, and far and wide throughout the land are spread the tidings of woe. In town and country, in remote Borrowdale, where Dick and his companion are reading during the Long Vacation, and in the grim manufacturing town of South Wales where Dick's aunt awoke with dismay to find that the savings of a lifetime had disappeared, the news creates universal dismay. To Dick's father, who has been ill and failing, the news is as a death-blow. Dick hurried back to Wales, but found his father dying. He received with his parting breath an injunction to regard it as his duty to pay the interest of all those of his father's congregation who could prove that they would

not have invested their money in the Emancipator but for the apparent confidence in the society shown by the old minister. It was the mortgage of a life, but Dick undertook it cheerfully, and after his father's funeral sermon had been preached, proclaimed from the steps of the pulpit his determination to dedicate the rest of his life to the fulfilment of the obligations which had been imposed upon him at his father's death-bed. After this scene the first part closes. It is a story complete in itself, and as long as most of the stories which are published in the Christmas annuals.

LADY SIDNEY.

Part II. opens with a description of the heroine, Lady Sidney Nestor, who had been left a widow by the

LADY SIDNEY.

sudden death of her husband on the Embankment. Lady Sidney is the type of the modern woman, accustomed from her childhood to ignore the disabilities of her sex, which in her case had no real existence. When this part of the story commences she is a widow under forty, with one daughter, Nedelca, the same whom Dick had rescued from the carriage wheels at Clapham Junction, and they are on their way to Rome. There Lady Sidney hopes to dull the edge of her own misery by musing among the ruins of departed empires and forgotten civilisations. Immersed for some time in her sorrow, she is indifferent to everything, nor can even the questionings of her lively daughter rouse her from her torpor. The first awakening was brought

about by a visit which she paid to the catacombs, where she lost her guide and extinguished her light, and was left alone in that vast labyrinth of funereal honeycomb. Confronted with death in silence, solitude, and darkness, Lady Sidney discovered that the will to live was strong within her, and in the depths of the catacombs she cried, "O God! if there be a God, deliver me for my child's sake." Soon after this she heard a distant tapping, and to her immense delight came upon Professor Glogoul, a leading character in Mr. Stead's Christmas story of last year, "From the Old World to the New," and who now reappears to play a still more conspicuous part in "Two and Two Make Four." The Professor, who is engaged in extracting a skull for the Ethnological Museum at Washington, leads Lady Sidney to the light by means of a thread left by a companion. When they regain the upper air they find that they are staying at the same hotel.

THE GIPSY'S PROPHECY.

Some days afterwards Lady Sidney, while riding in the Campagna, was the means of saving the son of the Queen of the Gipsies. The old woman, who was near her death, hailed Lady Sidney as—

"Queen of a realm that is to be,
But is not yet on land or sea."

Producing King Solomon's crystal, she bade the fair lady from beyond the sea read her fate. In the crystal Lady Sidney sees only a dim impalpable mass, which however clears, and a brick building faced with stone, surmounted by two towers flying the English and the American flags, is clearly visible. Then it faded away, and the crystal was clear once more. "That," said the old crone, "was your throne; now behold your sceptre." Again the mist overcast the crystal, and parting revealed the figure of Lady Sidney sitting at a desk and holding in her hand a magazine or pamphlet closely printed, but the contents of which she could not make out.

"Queen of a realm that is to be,
But is not yet on land or sea,"

said the gipsy, "I have delivered my message, and now must be gathered to my fathers." As Lady Sidney left the camp news was brought her that the queen was dead, and she galloped over the paved road to Rome pondering in her mind what could be the meaning of this strange prophecy.

FROM BEYOND THE TOMB.

It is again Christmas Eve. The Yule log had burned low, and Lady Sidney had retired to rest, brooding over the sorrowful memories of the last Christmas evening when her husband was still alive and well. She was awakened about midnight by a strange consciousness of a presence in the room. She saw a dim grey mist in the darkness, which gradually took palpable visible form, and the spirit of her husband stood by her side. The shadow bowed and kissed her, and she anxiously implored it to speak and tell her what she should do in order to carry out his wishes. "Go to St. Peter's, to the English confessional," said her husband's spirit, "and there it will be told you what you must do." Lady Sidney was an agnostic at heart, and she would not believe although "one should rise from the dead." However, she was not able to resist the impulse which drove her to the English confessional. She entered it half resentful, but answered the inquiries of the priest by telling him exactly why she had come. This leads up to the colloquy which gives the keynote to the story:—

Then, addressing Lady Sidney, he said very tenderly, "My child, what do you believe?"

Resenting his attempt to catechise her, Lady Sidney answered somewhat defiantly, "I believe in nothing."

"That is impossible," said the priest; "faith of some kind you must have, for without faith you cannot live."

"No," said Lady Sidney, disliking to be preached at by an invisible priest behind a screen. "I don't believe in anything. I don't believe in God, and I don't believe in the devil. I don't believe in heaven, and I don't believe in hell. I don't believe in your church, and I don't believe in your Bible. I don't believe I have a soul, nor do I believe that the apparition that I saw was my husband, for all that seems to me to be too good to be true. I think that when the body dies the person dies, and there is an end of him for ever." She bit her lip to restrain the tears which were pressing their way from under her eyelids, and was preparing for a vehement censure of what she felt in her soul was a somewhat insincere blasphemy, when to her astonishment the same voice went on, "That matters nothing. I did not ask you what you did not believe. I ask you again, what do you believe?"

Then she said, "Do you mean to say that it matters nothing what I do not believe?"

"It matters everything what you believe; what does not matter is what you do not believe."

"Well, really," she said, "except——" and she checked herself, but continued, "Although I am afraid that you will think it is flippant, the only thing in which I believe is that two and two make four."

She was just going to apologise for the remark which she had uttered, feeling how unsuitable it was to quote Molière in the confessional box, when the voice from behind the partition said quickly and with an imperious ring in its tone, "My daughter, it is enough. Live up to that and it will suffice. Peace be with you!"

Bewildered and piqued, Lady Sidney felt that the interview was at an end. She rose from her knees and regained her daughter. Nedelca saw in a moment that the interview had by no means ministered to her mother's satisfaction.

"Well?" said she anxiously.

"I think I have been a fool," replied Lady Sidney shortly; "but I will tell you about it when I get home."

So saying, they entered the carriage and drove to the hotel.

Lady Sidney, however, had not long to wait for the key to the mystery. That very night when she returned to the hotel one of the Official Receivers of the Emancipator was dining with the Professor. After dinner he described the widespread misery and desolation which had been wrought by the failure of that society. Mother and daughter might not have realised the bearing of the narrative but for a remark made by the Professor:—

"I am afraid," asked Nedelca, "that it is only too true. Cannot something be done to prevent such things occurring in the future? What is the use of the law and religion if it cannot be prevented? It is worse than Italian brigandage."

"Many things could be done by law," said Mr. Bruce, "but there is no party advantage to be got out of it, and so governments don't trouble themselves with it. If public opinion could only be roused to carry out those simple reforms which have been insisted upon time and again by the registrar of the friendly societies and others, an effectual check could be placed upon much of the swindling which we are discussing. As for religion——"

"As for religion," interrupted the Professor, who was standing with his back to the fire, and who was looking more weird and impressive than was his wont—"what has religion done except to afford a convenient mask behind which thieves could plunder with impunity? Religion!" said he—"I have been thinking a great deal about religion since I came to Rome. We are standing upon the soil that is made up of the remains of dead and decaying faiths. Go where you please, everywhere you are confronted with a ruined shrine of some forgotten God. In every direction the sky is pierced by spires and towers erected to saints innumerable whose very names are unknown in our new world beyond the sea. Yes, the Catholic faith is very beautiful, no doubt. It has more than a dozen saints for every

day of the year, but it does not yet seem to have produced the saint that is wanted in our time."

"What saint is that?" said Nedelca timidly.

"There have been saints of all shapes and sizes," said the Professor, "since the days of the good man who owned that holy skull which we brought from the catacombs the other day, and which is now carefully mounted under that glass case. We have had saints who have founded religious orders each more fantastic than the other. We have had articles of faith piled upon articles of faith, and innumerable beliefs which no one can understand, and which therefore no one can really believe. We can get everything in Rome—thigh-bones of saints, and toe-nails of martyrs; infallible dogmas, brand-new with the stamp of infallibility; cardinals and bishops, mon-seigneurs and friars, and all the flummery and frippery of ecclesiastical millinery; but as for the St. George who will kill the dragon of our time—that saint is not kept in stock at the Vatican."

"Well," said Mr. Bruce, "suppose you got your St. George, what would you have him to do?"

"Do!" said the Professor: "two things, and no more. He should found a new order and proclaim it in the place of the huge *omnium gatherum* of unbelievable beliefs; he should proclaim one article of faith, and it should be as clear, as short, and as universal as the watchword of Islam."

Nedelca, who had been listening with all her ears, never having seen the Professor in such an exalted mood, said, "What would be the Order that the new St. George would found?"

The Professor's voice softened, and he looked down kindly at the eager face below him, and said, "The Brotherhood of all who Love for the Service of all who Suffer."

"Well, that is not bad, Professor—not bad," said Mr. Bruce; "but to formulate your creed is not such an easy task."

"Yes, it is," said the Professor; "I have it all spick and span."

"Proclaim it," said Bruce, mockingly; "proclaim it here on Christmas Day, 1892, in presence of this select company."

"Well," said the Professor, "you may make fun of it as you please; but I am still firm in my conviction that the one great doctrine which it is of all things necessary that men should hold to if they would be saved from the endless miseries of these financial disasters is——" and he paused.

"What?" said Lady Sidney.

"Two and two make four," said the Professor quietly.

Lady Sidney started as if she had been stung.

"Mother!" exclaimed Nedelca.

"What is the matter, madam?" said Mr. Bruce.

"Nothing," said Lady Sidney; "but—I see now. Excuse me, Professor, but it is time that we were retiring."

After they left, Bruce remarked to the Professor, "What's up?"

Professor Glogoul, on whose face there still lingered some of the light of his exalted mood, smiled quietly and said, "Dunno; but I guess the new faith has made a convert on its first proclamation."

THE NEW ST. GEORGE.

Nedelca, whose imagination had been fired by the stories told by the Official Receiver and by the remarks of the Professor, no sooner was alone with her mother than she asked why she, Lady Sidney, could not play the part of a modern St. George. Lady Sidney protested that she had no faith, whereupon Nedelca replied that she believed that two and two made four, which, as the good priest said, was enough. Lady Sidney agreed to refer the question to the priest, and received from him the assurance that if she lived up to the light she had she would get more light.

About this time Dick Grant reappears upon the scene with one Jasper Sterling, whom no one will have any difficulty in recognising as a more or less roughly drawn picture of the author of the story. They are in the Church of the Jesuits discussing the possibility of

the appearance of a new Loyola. Dick declares that the saint who was most wanted was a new St. Dominic, who would wage war with fire and sword against fraud, which was the great heresy of an industrial age. That night, Lady Sidney and her daughter, accompanied by the

JASPER STERLING.

Professor, go to the Colosseum to see the ruins by moonlight. When there Lady Sidney meets Sterling, who reproves her somewhat rudely for pining over the days of old.

WHAT WOULD THE APOSTLE PAUL HAVE SAID?

The following conversation takes place, which leads up to the formation of the *Daily Paper* :—

"Well, but what could be done? Take my own case for instance. I am anxious to do something to serve my generation; I have not genius, but I have a certain position, and I have more money than I know what to do with."

Sterling looked at her, and then said, "Say that again!"

Lady Sidney rather resented his brusque manner, but she repeated that she was anxious to do some good to her fellow-men, and that she had more money than she knew what to do with.

Sterling's manner changed. "Tell me; you say you have more money than you know what to do with. Will you pardon me asking you a very straight question? If you saw a clear chance of doing good and realising your aspirations, could you afford to throw a million of money into the sea?"

"I don't exactly see the use of throwing a million of money into the sea, but if the cause were worthy of it, I should not miss the money much."

"And you," he said, with unutterable scorn in his voice, "an Englishwoman, who could afford to throw a million of money into the sea to realise your ambition and to do good to your fellow-men, you sit here groaning over these miserable Romans, while you have in your hand a potential sceptre which would make you queen of a world immeasurably vaster than the Roman imagination ever conceived. Yes; queen of a realm that is not as yet bodied forth into material existence,

but which might be if your faith were equal to your wealth. The English-speaking world, if once unified by a common faith and inspired by a common ideal, would form a realm the like of which has never yet been seen on land or sea. What woman in ancient times had such a chance? Zenobia, queen of the desert city, among the most pathetic of all crowned heroines of history, who was brought captive to this very city by her Roman conqueror, was but as a May queen of a village green compared with the grandeur of the rôle which you might play, and yet——" He broke off abruptly. "It is sickening to see such a sublime opportunity flung away."

"Well," she said, humouring him, "what would you do in my place?"

"I would do what I believe the Apostle Paul would have done if he had lived in our generation."

"What is that? Found a church, I suppose?" said Lady Sidney, shrugging her shoulders.

"No," said he, "the day for that has gone by. He would found a newspaper."

"Yes," said she, with a sigh, "being a journalist you think journalism is everything."

"There is nothing like journalism. There is no more powerful means of influencing the minds of men."

"You might be right if I were the Apostle Paul and had a faith to preach as he had."

"And have you no faith to preach?" said Sterling, stopping and looking her full in the face.

"Well, I have a kind of faith, I suppose."

"Then, madam, preach that."

"But," said she, "supposing it is a very meagre faith?"

"I don't care," said Sterling; "preach it."

"But supposing," she said, "for instance, it was no more than that two and two make four?"

"Well," said he, "that would be a rather narrow basis on which to found a newspaper, but it would be an admirable gospel for its city editor. In fact," he added, "it seems to be the gospel which the present generation most needs. The chief end of man has long since been recognised by most men to be ten per cent. In their pursuit of that people forget their arithmetic, and, by some hocus-pocus or other, imagine that two and two either make more or less than four. A paper whose city editor applied that standard inexorably to every department of the Stock Exchange and the money market would work a beneficent revolution."

"But a paper cannot be all city article," said Lady Sidney lightly.

"No," said he, "and if it were it would be no use. What you want is to get the doctrine that two and two make four into the head of the general public—of the investor, and of the thrifty working man who puts all his savings into a rotten friendly society, or the poor widow who sinks her all in such a swindle as the Emancipator." . . .

Jasper Sterling had come to the end of his reflections. "I may as well tell you I am going to start a newspaper myself," he said. "It fits in in every way with your gospel that two and two make four."

"Do you mean," said Lady Sidney, "that you could start the paper with the million you wished me to throw into the sea?"

"Madam," said he gravely, "I had no such thought; and if I had, I certainly should not ask you to be my proprietor."

"Why?" said Lady Sidney, somewhat piqued at his tone.

He laughed as he said, "You have far too keen a hold on life to hanker after the martyr's crown!"

DEW ON THE FLEECE.

Next day, Sterling calls at the hotel and explains the way in which he proposes to start his paper, which is, of course, identical with the means which Mr. Stead has employed for the starting of his new daily. The following passage, however, sets forth Mr. Stead's own view of the scheme which he has submitted to the public :—

Sterling began to explain his scheme. "I am going to start a daily paper in London. I have no capital, and, what is

more, I am not going to be beholden to any one by asking for it. I was afraid that you would think I was fishing for your millions when I was talking to you last night."

"I was not under any such illusion," said Lady Sidney.

"Thanks," said Sterling. "I do not want to start the paper unless it is my duty; and I regard the supplying of the needed funds as a sign of His will."

"Then you believe in signs and wonders?" said Lady Sidney.

Sterling glanced at her somewhat scornfully, and asked, "Do you know the story of Gideon's fleece?"

"You mean the novel?"

"No," replied he, "I mean the story in the Bible. But as you do not seem to know it, I will tell it to you. Gideon was suddenly warned by an angel of the Lord to lead the children of Israel against the Midianites. This was a large order, and Gideon was very dubious about taking it in hand. He had no experience as a leader; the Midianites were as the sea-sand for multitude, and it seemed sheer madness to attempt any such enterprise unless God willed it. The question was, did God will it, or did He not?"

"Gideon being a level-headed practical man, devised a rough test. So Gideon said unto God, 'If Thou wilt save Israel by my hand, as Thou hast said, behold I will put a fleece of wool upon the floor, and if the dew be on the fleece only, and it be dry on the earth beside, then shall I know that Thou wilt save Israel by my hand.'"

"And was it so?" asked Nedelca, who was not as familiar with the history of the Judges of Israel as she ought to have been.

"It is written," said Sterling, "that it was so. 'For he rose up in the morning and thrust the fleece together, and wrung the dew out of the fleece—a bowlful of water.' I am just in the same position as Gideon was. I have placed my fleece upon the threshing-floor, and am waiting to see if there will be any dew on it."

"What do you mean by dew on your fleece?" asked Lady Sidney.

"I used to say," said he lightly, "that I would be content with nothing less than a quarter of a million of money stumped down on the table without my asking for it. But I have given that up long ago. It would be too easy."

"What do you want now?" asked Nedelca.

"I want 100,000 persons who will be willing to pay a year's subscription in advance for the paper which I hope to found."

"And you would do it if you get them?"

"Yes," said he, "100,000 prepaid subscriptions for one year for a paper which is not to be in existence for nine months, that would be as marvellous a sign as the dew on Gideon's fleece."

"Do you think," said Lady Sidney, "that the dew will fall?"

"That depends upon whether or not I am wanted to start the paper. If I am, I shall be willing; if not I shall not be grieved, for the hosts of Midian are strong, and my strength is but small."

"What kind of paper do you propose to establish?"

"A penny morning daily paper. I edited a halfpenny paper for years, but there is no scope for side-shows on a halfpenny paper, and a paper without side-shows is nothing."

"What do mean by side-shows?" said Nedelca.

"Oh, I mean everything that a newspaper does in addition to the mere collecting of news and advertisements and printing them on a sheet of paper. That kind of paper I would not go across the street to edit, no, not if my fabled old lady with her £250,000 were to arrive by the next mail."

He then proposes to Lady Sidney that he will conduct the City Editorship on the lines of "two and two making four," and carry on a holy war in the spirit of the new St. George if she will insure him against loss. This she is willing to do, but objects to being limited solely to the City office. She proposes to undertake the whole of the social side-shows of the paper. Sterling does not immediately reply, but the second part closes as follows:—

Nedelca followed him to the door, and while the Professor was taking leave of her mother, she said to Stirling, "Are you going to accept mother's offer?"

He looked at the girl with a somewhat troubled air, and then said, "Yes, certainly, if there is dew on my fleece."

Without waiting for another question, he slipped downstairs and was gone. The moment Nedelca was alone with her mother, she embraced her tenderly and said, "And so you are really to be St. George after all!"

"At least," said Lady Sidney, "I think I have found my charger. But the dragon has still to be slain."

SIX YEARS HENCE. THE PAPER.

The third part of the story is entitled 1900 A.D. It begins by describing the return of Professor Glogoul and his wife from South America, where they have been for the last six years. They come back to an altered world. London has been transformed, and England is Merry England once more. This transformation has been wrought by the *Daily Paper*. In his description of this change, Mr. Stead brings to bear all the results of his experience as a journalist for more than twenty years. In the story Lady Sidney has certainly not spared her millions. She has bought the Emancipator building on the Thames Embankment in front of which her husband was killed, built a National Theatre, established a Conservatoire of Music on the site of the Royal Aquarium, and has just settled the cost of a lawsuit which has footed up to £150,000.

THE FELLOWSHIP.

But even Lady Sidney's millions are inadequate for the task which the *Daily Paper* has in hand. The chief instrument by which it achieves its wonders is the fellowship or the union of all those who love in the service of those who suffer. Every Fellow subscribes the cost of a cigarette a day to the Fellowship Fund, and as there are supposed to be 500,000 Fellows, this represents an available income of £750,000 a year. Such a sum requires some spending, but the various branches of the Civic Church and the *Daily Paper* are adequate to the disposal of a much larger sum. For as the story proceeds it is evident that it is not so much the foundation of a daily paper, in the ordinary sense of the word, as the re-incarnation in modern guise of the spirit of the Mediæval Church. That basis is catholic with a small c as opposed to Catholic with a capital C, and its object is the service of man. One great feature, however, is the recognition of the rights of woman, for it is roundly laid down as a principle that no man should be employed on the *Daily Paper* until it was proved that no woman fit for the post could be secured.

THE PILGRIMAGE.

After describing a great fête on the river, one of the many schemes contrived by the *Daily Paper* for the purpose of vivifying English life and reviving popular interest in the history of the past, the scene changes to Switzerland. There Dick Grant, the historical director of the modern pilgrimage, finds his fate; and there an accident befalls Nedelca, for which the reader must be referred to the story, merely remarking that the author does not venture to carry his originality so far as to sin against the fundamental principle of a Christmas story that it should end happily.

The story, it will be seen, is an attempt to explain in the shape of a romance a scheme of social reorganisation, worked out by journalistic methods energised by the fundamental ideas of the Christian Church as they found expression at the time when the great Churchmen saved civilisation.

GIFT LITERATURE.

A FIRST BATCH OF CHRISTMAS BOOKS.

WHAT can one find to say that is new about Christmas books? Every year the output becomes larger, and every year the output becomes better. Children have never been so well

catered for in the matter of literature as in this present year of grace; and for their elders even a class of gift-books has arisen which, starting at first with gaudy and meretricious display, is gradually coming, to be more and more tasteful, finding its best exemplars, perhaps, in illustrated and beautiful editions of old classics, such, for instance, as the recent re-issues of "The Vicar of Wakefield" and "Cranford," by Messrs. Macmillan, or the dainty editions of Jane Austen, Maria Edgeworth, and Fanny Burney, which Messrs. J. M. Dent and Co. publish. To many it has seemed a pertinent question whether the constantly increasing crowd of children's books does not elbow out the older and perhaps better favourites, the classics of the nursery bookshelf? Have Mr. Henty and Mr. Manville Fenn to answer for wooing readers from "Robinson Crusoe"? Will Mr. Andrew Lang's "True Story Book" or Mr. Joseph Jacobs' admirable series prevent children turning again and again to Hans Andersen, to the Brothers Grimm, to the "Arabian Nights," to Lewis Carroll? We think not.

Mr. Henty may write and write—he does write and write, if one may judge from his yearly tale of volumes—Mr. Fenn and Mr. Robert Leighton may never cease from story-telling, and yet there will always be a sufficient audience for "Robinson Crusoe"; Mr. Lang and Mr. Jacobs may employ all their wits in providing yearly treats for the little ones, and yet Hans Andersen will find fit and many readers. The truth is, of course, that in children's literature, as in everything else, only the best books survive. Most of the volumes which appear every autumn have, as far as demand is concerned, the most ephemeral of lives: with the spring they are forgotten, for every year brings its own crop. Occasionally a book will live—such a book as "Alice in Wonderland," for

instance—but in the general course the old Hentys, the old Manville Fenns, although they have no uneventful existence on the shelves of their lucky possessors, are forgotten by the booksellers almost in the year of their appearance.

And then, of course, the best books and the old books are constantly making new bids for popularity; publishers never ceasing bringing out with fresh attractions the books which made happy their own and their grandfathers' youth. Already, for instance, we have noticed among the announcements two new editions of Hans Andersen.

This month our survey will be of the briefest: a few only of the best books will be noted for the convenience of those of our readers who may be anxious to send presents to the colonies and abroad. Next month we hope to complete our task.

JUNIORES PRIORES.

At Christmas the elders give place to their children, so we will give the precedence to a children's book, and to a book which, whatever the next month may produce, is hardly likely to be excelled in the gift-books of the year: Mr. Joseph Jacobs' "More English Fairy Tales." Its author should be a truly happy man if the blessings of

countless children count for aught. With such a testimony of delight as is owing to him at Yule-Tide he can almost afford to disregard the criticisms of Mr. Andrew Lang and other folklorists who view with, perhaps, excusable distrust and disfavour Mr. Jacobs' tampering with the stories they have collected with so much zeal. But what cares the nursery for such questions of the study? Readily will it excuse even the alteration of a Scotch ballad into an English fairy-tale if the result is but pleasing. At Christmas the matter is for pedants

alone. Well, this year Mr. Jacobs has come near surpassing himself. His new book is simply and solely

(From "More English Fairy Tales.")

(From "More English Fairy Tales.")

delightful. Never in recent years, except in his own books and in those of Mr. Lang, has so charming a collection of fairy tales appeared. The whole volume is of delight compact. Mr. Jacobs claims to have included nothing but English tales, but he has taken them wherever he could find them—from the United States, and even from the Lowland Scotch! One recognises favourite after favourite in a new and pleasant dress—for Mr. Jacobs has just the style for the nursery—and one reads the variants upon "Cinderella," "The Babes in the Wood"—but why call it "The Children in the Wood," Mr. Jacobs?—and "The Pied Piper of Hamelin," with increasing pleasure. "The Pied Piper" Mr. Jacobs names his version of this last, and from this tale one of our illustrations is taken. It is a legend of Newport, in the Isle of Wight, and the sketch shows the piper pushing out to sea piping after him, as Browning says:—

Great rats, small rats, lean rats, brawny rats,
Brown rats, black rats, grey rats, tawny rats,
Grave old plodders, gay young friekers,
Fathers, mothers, uncles, cousins,
Cocking tails and pricking whiskers.

The other droll little sketch—both are from the inimitable hand of Mr. J. D. Batten, whose numerous illustrations this year show no signs of weakening fancy—shows the Hobyahs on the rampage. What the Hobyahs do you must find out for yourselves: they eat people and tie little girls up in bags, among other things. Indeed, children, "More English Fairy Tales" is the book you should ask for if you get the chance.

A NEW HANS ANDERSEN.

Certainly, if there is one of the old nursery favourites upon whom desuetude has fallen, it is the incomparable Hans Andersen, so that one is especially glad to see that two new editions, with the added attraction of adequate illustration, are to appear this autumn. One of these* is already in our hands, and very attractive it proves, with the pleasing drawings of Mr. (or Miss) E. A. Lemann, which have about them a certain artlessness admirably suiting them to the letterpress. Not by any means all the stories are included—there are many old favourites which we miss; but these, we hope, will form the nucleus of a second series. Andersen, as the preface says, was a Great Magician, and no jot of his writings for children but should be worthily presented—as, for instance, they are in this volume.

DAUDET FOR BABES.

Mr. Fisher Unwin's dainty Children's Library is growing apace. Last year one of

the most delightful of its many delightful volumes was the translation of Alphonse Daudet's "La Belle Nivernaise," and this year we have another volume* translated—very well translated—from the same author's stories for children. Nothing could exceed the delicacy of these charming little tales or of the prose in which they are told: they are real contributions to nursery literature, and deserve a permanent place on every children's bookshelf. Pathetic here—as in those miniature tragedies of the French loss of Alsace and Lorraine, "The Last Lesson," and "The False Zouave;" drolly serious here—as in "M. Seguin's Goat" and "The Stars," they are everywhere real gems of literature, of that kind of literature which children love, and which has that indefinable artlessness which is the essential attribute of the good children's book.

FOR GIRLS.

The modern spirit in literature is penetrating even to the schoolroom. Here we have one of Messrs. Blackie and Son's authors, Mr. J. K. H. Denny—whose name is quite new to us—giving us a girl's story† in which the characters are a more important consideration than the incidents, and where the value and interest of the book lie rightly in the influence of circumstance upon character rather than the mere bald narrative of incongruous action. "The Clever Miss Follett" is the story of a family which suddenly becomes immensely enriched—a *motif* which has acquired great popularity of recent months—and which not unnaturally is immediately anxious to better its social position, to "get into society," and to make "good marriages." The latter part of the tale is a variant upon "Timon of Athens" and the old Arabian legend of the man who, losing all his money, goes out to see what friends he may have left, for the Folletts' wealth is as suddenly taken from them, and they at last see their position in the society which they have made in its true character. The story is well written; it is not goody-goody, although its moral is excellent; and it is just the book to give to girls, who will delight both in the letterpress and the twelve illustrations by Miss G. Demain Hammond, who has never done better work.

A word of praise for the cover: it deserves the honourable place which it has in the Arts and Crafts Exhibition, for it is admirably conceived.

WITH THE HUGUENOTS.

How well one knows Mr. Henty's method, and how many books to expect from him every year! With machine-like regularity he produces Christmas

(From Hans Andersen's "Fairy Tales.")

* "Fairy Tales." By Hans Christian Andersen. Edward Arnold. 7s. 6d.

* "The Pope's Mule and other Stories." By Alphonse Daudet. T. Fisher Unwin. 2s. 6d.
† "The Clever Miss Follett." By J. K. H. Denny. Blackie and Son. 6s.

after Christmas three books, two at six shillings and one at five, and all three dealing with some important and picturesque historical period, or with some vivid and interesting country. Nor does this regularity of production seem to interfere with the excellence of workmanship which one has learnt to associate with Mr. Henty's name. He is always full of instruction—covert instruction about exciting historical events, for boys will have no “school-book twaddle” dished up with their Christmas tales—and his books are always alive with moving incident. This year he has chosen for one of his books* the period of the massacre of St. Bartholomew, and a right stirring yarn he has spun out of these somewhat well worn materials. His hero is a frank English lad, one Philip Fletcher, whose mother being French, decides him upon crossing the Channel to join with the Huguenots in their glorious struggle against religious persecution. His bravery and his intelligence soon win him promotion, and the consequent crop of dangerous adventures. At the moment depicted in the illustration we give, he is in prison: the narrative of his escape is thoroughly spirited and is only to be excelled by his later escape with his faithful companion and his sweetheart from Paris after the tocsin has rung on the fateful Eve, and all the city is given over to murder and rapine. You can see for yourselves that Mr. H. J. Draper's illustrations are excellent, and the book contains as well a good coloured map of France in the year 1570.

FOR THE POETICAL.

The criticism of poetry has become of late years so very much overdone, that to day a new book of the kind has to be either very good or very novel to justify its being. Certainly if the chief aim of the critic is to attract attention to the work criticised, then is Mr. Arthur D. Innes' “Seers and Singers” †

many times justified, for it is just the book to place in the hands of young man or maiden whom one wishes to lure to the delights of verse. Simplicity is the chief and the most pleasing quality of this dainty little book—for, printed by Constable, upon handmade paper, and bound with singular taste, it has a “get-up” unusually winning—simplicity of style and simplicity of thought. It cannot be pretended that Mr. Innes has anything very fresh to say about the five poets

whom he considers—Wordsworth, Brown- ing, Tennyson, Matthew Arnold and Mrs. Browning—but he has said the old things in just the right way, taking the reader into his confidence, assuming no airs of superior knowledge, and gossiping pleasantly upon the characteristics which they have in common, and the qualities which distinguish their work. “A sort of one-sided conversation,” Mr. Innes' own description of his little book, gives just the right impression; but although he converses, he is happily never colloquial; and although his feet are on the fender, and his favourite books are by his side, he is never slipshod. He quotes largely and wisely from all five poets, so that his readers have a constant example of the pleasures that lie before them if they but take “Seers and Singers” in the proper spirit.

YOUNG NATURALISTS.

A brief word may be said in praise of a volume which comes to us in a somewhat similar garb to the series of fairy tales with which is associated Mr. Andrew Lang's name. Mr. Furneaux's “The Outdoor World,”* with its six-

teen fine coloured plates, and its five hundred illustrations in the text, is just the book that boys or girls interested in natural history would give their eyes for. The animal, the vegetable, and the mineral worlds—Mr. Furneaux has included them all in his book, which combines instruction with amusement in the most delightful of manners.

* “St. Bartholomew's Eve.” By G. A. Henty. Blackie and Son. 6s.

† “Seers and Singers: a Study of Five English Poets.” By Arthur D. Innes. (A. D. Innes and Co.) 5s.

* “The Outdoor World; or, The Young Collector's Handbook.” By W. Furneaux, F.R.G.S. (Longmans.) 7s. 6d.

PHILIP IN PRISON.

(From “St. Bartholomew's Eve.”)

THE NEW BOOKS OF THE MONTH.

IRON, RALPH. *Dream Life and Real Life: A Little African Story.* (T. Fisher Unwin.) Long foolscap 8vo. Paper Covers. Pp. 93. 1s. 6d.

"A Little African Story"—a very little African story and two other stories, each shorter than the first, make up this small book, which if printed in the ordinary type of this REVIEW would hardly take up more than a couple of pages. And yet perhaps one should not grumble at its brevity: a jewel is not valued by its size, or a lyric by its length, and it were ungracious to cavil when each of the three stories is an exquisite work of art, a real contribution to the number of short stories which are literature. "Dream Life and Real Life" is one of Miss Olive Schreiner's earliest efforts—it was written for her brother's school magazine—but it shows no signs of the beginner: its literary quality is of the highest; its style is restrained, every phrase, every word helping to build up the impression. The intense pathos, the intense misery which make the little Danish goatherd's only experience of life become real to the reader: the sentiment is not by a single line overdrawn, and her sad end partakes of the reality of the inevitable. Both the other stories—the second is rather an episode, a sketch—have the same distinct and unusual qualities of restraint and of power. Indeed, if one feels tempted for a moment to grumble at the short measure given for one's money, one immediately remembers that each of the three central ideas which under the hand of the author of "The Story of an African Farm" have made exquisite—we willingly use the word a second time—pages, would with the more commercial treatment of the average "man of letters" have attained the dullness of a complete book. For how few "men of letters" could reach the deep ironic bitterness, the sense of the sadness, the agony of life, that is in the few pages of "The Policy in Favour of Protection—."

BENSON, ARTHUR CHRISTOPHER. *Poems.* (Elkin Mathews and John Lane.) Fcap. 8vo. Paper boards. Pp. 192. 5s. net.

Certain modern tendencies—the tendency among present-day writers to be artist first and man afterwards, the tendency to exalt criticism of literature to the level of literature itself—having vexed Mr. Benson's aspiring, perspicacious soul, he has "tried, with his eye on life, to present certain aspects of men and nature that have come home to him with force." To the majority of readers the high quality, the very high quality, of the result of this attempt will come with a shock of surprise; but those wiser readers of poetry who watch jealously for the latest and rarest developments of modern verse, will not have been altogether unprepared for Mr. Benson's success. For last year, a private printed volume, entitled "Le Cahier Jaune," demonstrated without doubt to its reader that one other real poet was with us. These poems are not modern in the latest sense of the word: to a generation which has shown signs of tiring of the accustomed metres they may seem old-fashioned, but one thing is certain, that modern or old-fashioned, Mr. Benson's ultimate success has now been placed beyond the warring opinions of different "sets," and will depend entirely upon whether or not his progress upon the lines that he has laid out for himself is at all commensurate with his present achievement. There is grace, thought, feeling, skill, in these poems; there is a view of nature and of its commonest objects thoroughly unhackneyed; and there is a depth of reflection in some of the more purely subjective verses only too rare at the present day. "Fritillaries," "Hidden Life," "The Toad," "The Dragonfly," and "Gilbert White," seem to us among

the most successful pieces; the last of these contains those beautiful lines:—

This was thy daily task, to learn that man
Is small, and not forget that man is great.

NOTTAGE, CHARLES G., LL.B., F.R.G.S. *In Search of a Climate.* (Sampson Low.) Royal 8vo. Cloth. Pp. 351. 25s.

Mr. Nottage has anticipated the strictures of those critics who are likely to be influenced by the way in which the subject suggested by the title is kept in the background, by printing in his preface a number of tentative reviews of a somewhat hostile type. We can assure him, however, that he need not fear that any one who reads his book through will have much else but praise for its exceedingly interesting character, and that the mere fact that he has relegated the question of climate to a secondary position will easily be forgiven. Having some obscure chest complaint, Mr. Nottage decided upon leaving England "in search of a climate" for a tour which might comprise a visit to Australia, the Sandwich Islands, and Southern California. Once we have got over a certain egotism, the result to the reader is almost entirely pleasant, for the author, although he can boast no particular literary style, is an excellent gossip; and as he saw a good deal upon his tour, and passed through the Hawaiian revolution, his record is not without value. The photographic illustrations of the book deserve more than a word of praise: designed and reproduced in photo-mezzotype by the Stereoscopic Company, they are of very unusual merit, and should make popular any book of travel. And with such pictures, and with Mr. Nottage's interesting text, "In Search of a Climate" is likely to become one of the most popular books of the season. It has, however, one serious fault: it has no index; and on one or two social questions Mr. Nottage is, perhaps, hardly at the right point of view.

STEEL, FLORA ANNIE. *From the Five Rivers.* (William Heinemann.) Crown 8vo. Cloth. Pp. 212. 6s.

The comparison that has so often been drawn between Mr. Kipling and Mrs. Steel is unfair to both writers. Possibly it was the success of "Plain Tales from the Hills" that suggested to the authoress of this volume the using of her own somewhat exceptional Indian experience as the groundwork for a series of short stories, but there can be no question of imitation. "Plain Tales from the Hills" and "From the Five Rivers" both deal with Indian subjects, but there the resemblance almost ends. Mr. Kipling's is the India of the cantonments, the barrack-room, the bazaar and the fields; while Mrs. Steel deals rather with that intimate section of Eastern life which is concealed from masculine eyes—the life of the house, of the women's quarters. And this life she seems to have made her own with wonderful success—so much so, indeed, that she has more than once forgotten her readers' ignorance, and been betrayed into obscurities which cannot easily be unravelled. One would be sorry to say how many of these eight stories are rendered partly or wholly unintelligible to readers unacquainted with Indian life and custom. The humour which lurks in "The Blue Monkey," for instance, is almost lost, and "At a Girls' School" is only to be understood in snatches. The first and longest story is, however, perfectly clear. It is a study in Indian life as pathetic and as truly real as anything of the sort that has appeared: its note is the intense longing that the Indian feels for a man-child, and it would make valuable a volume far less clever than is Mrs. Steel's.

BIOGRAPHY.

ADAMS, JOHN, M.D. *Burns's "Chloris": A Reminiscence.* (Morrison Brothers, Glasgow.) Paper covers. Pp. 187. 1s. 6d.

To that lamentably large section of readers to whom the latest "chatter about Harriet" is by far the most interesting portion of literary history, Dr. Adams's book will come as a disappointment. The vindication of Jean Lorimer's character from the aspersions with which "the foul, weedy imagination" of Allan Cunningham cast upon it, has been Dr. Adams's purpose, and he seems to have succeeded. Having met "Chloris" when a mere lad, Dr. Adams has more than one interesting reminiscence of which to write, and the reader will be glad of his collection of those poems in which she figures, and for the facsimile reproduction of the original manuscript of "The Song of Death" which was delivered into his hands by Jean Lorimer herself. Burns specialists alone can decide upon the real value of this contribution to Burns literature, but there can be little question that Dr. Adams has rather overdone his references to those "literary pathologists" whose admiration for the Scotch poet has made them desire editions in which some of his sweetest poems have not been omitted for reasons of ultra-delicacy. Let there be an edition of Burns for the family table by all means, but let us also jealously keep some editions from emendation or bowdlerization.

ADKINS, W. RYLAND D. *Our County.* (Elliot Stock.) 4to. Cloth. Pp. 123.

A series of forty short descriptions, accompanied by portraits by Mr. W. B. Shoomsley, of some of the leading men of Northamptonshire.

BALLANTYNE ARCHIBALD. *Voltaire's Visit to England, 1738-1739.* (Smith and Elder.) Crown 8vo. Cloth. Pp. 338. 8s. 6d.

Carlyle's remark that no competent man would be likely to inquire into that period of Voltaire's career which he spent in England is at last falsified. The "inanity and darkness" which covered those years has gradually been dispelled, and now comes Mr. Ballantyne with a work which makes clear almost the whole sojourn. To readers of Carlyle, and to readers interested in the brilliant galaxy of English writers who were Voltaire's contemporaries, this book will make particular appeal, for Mr. Ballantyne does not confine himself to the years during which Voltaire resided in England, but devotes a chapter to his subject's later relations with Englishmen, in which he brings the chronicle of his English acquaintance up to the time of Voltaire's death. The titles of the different chapters will give the best idea of the scope of the work: "Preliminary," "Voltaire and Bollingbroke in France," "Voltaire's First Impressions of England," "Voltaire in Retirement at Wandsworth," "Voltaire's English Friendships," "Voltaire's Literary Work in England," "Voltaire on English Life and Literature," "Voltaire's Later Relations with Englishmen," "Conclusion." The book is furnished with an excellent index.

BARROWS, JOHN HENRY. *Henry Ward Beecher: The Shakespeare of the Pulpit.* (Funk and Wagnalls.) Crown 8vo. Cloth. Pp. 541. 6s.

A volume in the series devoted to American Reformers. Mr. Barrows has aimed at giving "in swift, flowing narrative, the story of Beecher's spiritual inheritance, his interesting early developments, his various achievements, sorrows and triumphs," and not at describing fully "the reform movements through the midst of which flowed the current of his career." The book contains an excellent portrait of Henry Ward Beecher and an index.

HASSALL, ARTHUR HILL, M.D. *The Narrative of a Busy Life: An Autobiography.* (Longmans.) Crown 8vo. Cloth. Pp. 82. 5s.

An autobiography which will be of value chiefly to medical men, although it contains much general scientific matter of interest.

LEE, SIDNEY (Editor). *Dictionary of National Biography.* Volume XXXVI. (Smith and Elder.) 8vo. Cloth. Pp. 447. 15s.

This volume carries this magnificent publication from Malthus to Mason. Its most important articles are those on Malthus and Harriet Martineau, by Mr. Leslie Stephen; Mary Queen of Scots, by Mr. T. F. Henderson; Captain Marryat, by Professor J. K. Laughton; and Andrew Marvell, by Mr. C. H. Firth.

Reminiscences of Seventy Years' Life, Travel and Adventure: Military and Civil; Scientific and Literary. Volume I. Soldiering in India. (Elliot Stock.) 8vo. Cloth. Pp. 558.

The author of this volume—"A Retired Officer of H.M.'s Civil Service"—"having passed his seventieth year and led a life of remarkable vicissitude, the greater part of which has been spent in the public service," hopes that "a sketch of a soldier's life and its surroundings in India fifty years ago may be of some value." It is an interesting, if somewhat lengthy record, and his readers will look forward to a second volume, in which he will relate his experiences in "H.M.'s Civil Service, in Naval Dockyards, on great Scientific Expeditions," etc.

SIMSON, JAMES. *Eminent Men of Kent.* (Elliot Stock.) 8vo. Cloth. Pp. 178.

A series of studies of the lives of the most prominent men of ancient and modern times who have been associated with the county of Kent.

The Life of Robert Rudolph Suffield. (Williams and Norgate.) Fcap. 8vo. Cloth. Pp. 327.

UNDERWOOD, FRANCIS H., LL.D. *The Poet and the Man: Recollections and Appreciations of James Russell Lowell.* (Bliss, Sands and Foster.) Crown 8vo. Buckram. Pp. 138.

This brief memoir, to which appears as frontispiece a portrait of Lowell at seventy, is wholly distinct from Dr. Underwood's previously published biographical sketch. Here his intention has been rather "to furnish in a compact form the important facts in the poet's life, with a brief account of his work, and to record some personal impressions and reminiscences." For these last Dr. Underwood had exceptional opportunities, for during several years he lived near Lowell at Cambridge (U.S.A.), and was one of a circle of half a dozen of his friends who met often at Lowell's house and elsewhere.

ESSAYS, CRITICISMS AND BELLES-LETTRES.

HUXLEY, THOMAS H. *Darwiniana: Essays.* (Macmillan.) Crown 8vo. Cloth. Pp. 475. 5s.

The second volume of the collected edition of Professor Huxley's writings now appearing at monthly intervals in the Everyday Series. The essays here contained extend over a lengthy period of time, the first, upon "The Darwin Hypothesis," having appeared in 1859, and the last, an "obituary notice" of Charles Darwin, in 1885. Other essays are entitled "The Origin of Species," "Criticism on 'The Origin of Species,'" "The Genealogy of Animals," "Mr. Darwin's Criticism," "Evolution in Biology," "The Coming of Age of 'The Origin of Species,'" "Charles Darwin (1882)," "The Darwin Memorial," and "Six Lectures to Working Men 'on our Knowledge of the Causes of the Phenomena of Organic Nature.'"

KNIGHT, WILLIAM, LL.D. (Editor). *Prose Writings of Wordsworth.* (Walter Scott.) Crown 8vo. Cloth. Pp. 198. 1s. 6d.

These "prose writings" are of the slightest, many of them being extracts from Wordsworth's letters, or from the prefaces, appendices, and notes to his successive editions of his poems. Professor Knight's introduction is interesting, and the bibliography of the sources from which the extracts have been taken will be useful.

MALORY, SIR THOMAS, Kt. *Le Morte d'Arthur. Part III.* (J. M. Dent and Co.) 4to. Paper covers. 2s. 6d. net. Illustrated by Mr. Aubrey Beardsley.

FICTION.

ADAMS, MRS. LEITH. *Louis Draycott: The Story of His Life and Geoffrey Stirling.* (Jarrold.) Crown 8vo. Cloth. Pp. 279 and 397. 3s. 6d. New editions.

ALLEN, GRANT. *The Scallywag.* (Chatto and Windus.) Three volumes. 31s. 6d.

This particular scallywag—a scallywag, one of Mr. Allen's characters informs the ignorant, is "the sort of man, you know, you wouldn't like to be seen walking down Piccadilly with"—was the son of a baronet who was also a cab proprietor, and about as rough and ready a specimen of that profession as can be imagined. Paul Gascoyne, as he was called, had however been taken in hand by a Jew money-lender—an excellent character—who had sent him to a good school, to Oxford, had lent him money, and who now expected him to use his culture, his education, and his prospective title, to marry an heiress whose fortune would liberally repay the money-lender, and would enable Paul to live up to his baronetcy. How the little plan is frustrated, and how a great many exciting and interesting things happen to him and to his Jewish patron, must be left to the reader to discover. "The Scallywag" is as good a novel as Mr. Grant Allen has published, and, of its kind, is as good a novel as has lately appeared.

BARRETT, FRANK. *Kitty's Father.* (Heinemann.) Crown 8vo. Cloth. Pp. 330. 3s. 6d. New edition.

BAYLEY, ELIZABETH BOYD. *Jonathan Merle: West Country Story of the Times.* (Jarrold.) Crown 8vo. Cloth. Pp. 598. 3s. 6d. New edition.

BESANT, WALTER. *The Rebel Queen.* (Chatto and Windus.) Three volumes. 31s. 6d.

The Jewish doctrine that the woman must obey the man seems to be the message at the back of Mr. Besant's new novel. In literature at present, thanks largely to Mr. Zugzwilg, Hebrews are in fashion, and in choosing the majority of his characters from among the London Jews Mr. Besant has only once more shown his cleverness. The Rebel Queen is an almost absolutely rich Jewess who, full of the wrongs of women and of the subjection of her sex, separates herself from her husband, who has refused to break the law and customs of the people by giving to his wife a position of equality in his house. That Mr. Besant's sympathies make him control the woman's destinies to such a way that all her work for the great Cause comes to nothing is to be regretted; but there is a note of tragedy in the wreck of such splendid hopes and such unceasing devotion, and in the disappointment that comes to the woman in a daughter who refuses to work upon her mother's side in the labors for which she had been trained, that almost atones for the weakness of his position. The story is over-long, but some of the characters are excellent: the young man who was going to abolish the power of capital by making the interest illegal, and who always held that "women are different; the Jew who believed that the greatest compliment he could pay his daughter was to say that she ought to have been born a boy; the peer who wanted to share in the Common Lot, and got it—in the shape of a life of toil and a drunken wife—these are worthy newcomers in the large gallery of characters which Mr. Besant is creating.

BLACK, WILLIAM. *In Far Lochaber.* (Sampson Low.) Crown 8vo. Cloth. Pp. 393. 2s. 6d. New edition.

BONTE, ANNE. *The Tenant of Wildfell Hall.* (J. M. Dent and Co.) Two volumes. Fcap. 8vo. Cloth. Pp. 267 and 268. 5s. net. New edition. Illustrated.

UBOIS, M. A. *The Romance of a County: A Masque.* (T. Fisher Unwin.) Two volumes. 21s.

Judged as a work of sustained and unusually powerful, if somewhat sombre, imagination, rather than as a conventional novel, Miss Curteis' new work deserves a considerable success. As a novel it is interesting, often exciting, and containing here and there passages of great strength and beauty, not it is as a masque, a fantasy, an allegory somewhat reminiscent of Gulliver's Travels, or "The Pilgrim's Progress," that it should be viewed. It readers it must have; it is to be hoped that they will not be few, for the author of "Jenny" deserves to be better known and to be more widely read.

DOVONAN, DICK. *From Chase to Capture: A Series of Thrilling Detective Stories.* (Hutchinson.) Crown 8vo. Cloth. Pp. 320. 3s. 6d. Illustrated by Mr. Paul Hardy and others.

DODNEY, SARAH. *A Romance of Lincoln's Inn.* (Hutchinson.) Two volumes. 21s.

Your lady novelist is nothing nowadays if not modern and up to date, and Miss Dodney in this her latest novel has wisely seized upon the phenomenon of crystal-gazing, weaving it into her interesting story with great skill and tact. She has treated the episode seriously and cleverly, and the result is that she has made convincing a scene which in more clumsy hands might have died completely to impress the reader. "A Romance of Lincoln's Inn" is distinctly a clever story, and one to order from the library.

BERAND, SIR MORTIMER, K.C.I.E. *Helen Trevelyan; or, The Ruling Race.* (Macmillan.) Crown 8vo. Cloth. Pp. 487. 3s. 6d.

A new edition of a novel which acquires additional interest from the fact that Sir Mortimer Durand is at the present time our British Indian envoy at Kabul, and that many of the scenes of the story are laid in Afghanistan and India.

EDGEWORTH, MARIA. *Leonora, Emmu, Vivian, and The Absentees.* (J. M. Dent and Co.) Fcap. 8vo. Cloth. Pp. 225, 247, 257, and 333. 2s. 6d. each, net.

Four new volumes of this delightful edition of the most important of Miss Edgeworth's novels and tales, reprinted with the original illustrations. "Emmu" is the first of the "Tales of Fashionable Life," of which it is at present only intended to reprint the largest. The fifth and sixth volumes in this pretty new edition of Miss Edgeworth's best novels form part of the "Tales of Fashionable Life." "The Absentee" being the last, and perhaps the best, to appear, and both are illustrated from Harvey's original plates.

FRAPAN, ILSE. *God's Will and Other Stories.* (T. Fisher Unwin.) Long Fcap. 8vo. Paper Covers. Pp. 214. 1s. 6d.

A very pleasing and natural collection of short stories, translated by Mrs. Frapan, and now forming a volume of the Pseudonym Library, which has before given welcome to Miss Frapan. Certainly the six stories now selected are worth reading.

HALTON, GWENDOLEN DOUGLAS. *A Step Aside.* (Horace Cox.) Three volumes. 31s. 6d.

A conventional and in no way original story, but one which is generally interesting and readable.

GINGOLD, HELEN E. A. *Seven Stories.* (Remington.) Crown 8vo. Cloth. Pp. 187.

Miss Gingold, seeing that short stories are "neglected by the rest of writers" (we believe that the output of short stories for the last year has been about three volumes a week), has written for "those sons and daughters of earth whose every hour is precious," seven tales. Certainly, to use her own words, her intentions are better than her work, for all seven stories are extremely ill-written, and although they are readable, they owe most of their interest to their naïf lack of skill.

HARDY, THOMAS. *Two on a Tower, and The Leodician.* (Sampson Low.) Crown 8vo. Cloth. 2s. 6d. each. New editions.

KRASZEWSKI, JOSEPH IGNATIUS. *The Jew.* (William Heinemann.) Crown 8vo. Cloth. Pp. 469. 3s. 6d. Paper Covers, 2s. 6d.

Translated from the Polish, and now forming a volume of the International Library. In his preface Mr. Gosse tells the reader enough about Kraszewski to enable him to see that, even if his work is somewhat too diffuse and untrained, it is of surpassing moment, his personality at least was one of curious interest. As regards the bulk and volume of his writings, Mr. Gosse says he was of the mood of giants, "to be thought of with Lope de Vega, with Voltaire, with Alexander Dumas." An incomplete list of his works records the names of more than four hundred and fifty volumes!

NISBET, HUME. *The Queen's Desire: A Romance of the Indian Mutiny.* (F. V. White.) Crown 8vo. Cloth. Pp. 312.

Mr. Nisbet's fervid imagination has again served him in good stead. Few so genuinely interesting sensational novels have appeared this year than this

exciting romance, in which is traced with great vividness many of the most important episodes of the Indian Mutiny. Mr. Nisbet's characters are hardly sympathetic, but their adventures are thrilling.

OTTOLENGUI, RODRIGUES. *A Conflict of Evidence.* [(G. P. Putnam's Sons.) Paper boards. Pp. 317. 2s.

This story fulfils the first qualification of a good detective novel: it thoroughly succeeds in hoodwinking its readers. As one progresses one gets some faint glimmerings of the truth, but when the ingenuity of Mr. Barnes—the same detective who figured in "An Artist in Crime"—unravels the mystery of the murder, one is thoroughly surprised. But it cannot be called a very good specimen of its kind, for its characters are totally unreal and unconvincing.

PAYN, JAMES. *A Stumble on the Threshold.* (Horace Cox.) Crown 8vo. Cloth. Pp. 329. New edition, illustrated by Mr. Hal Ludlow.

PARKEE, MRS. HADDEN. *Ermengarde: A Story of Romney Marsh in the Thirteenth Century.* (Elliot Stock.) Crown 8vo. Cloth. Pp. 247. Illustrated.

An interesting historical romance of the times of the Crusaders. The heroine is the daughter of one of the family of the Counts of Toulouse. The mother is an Albigensian, who on the outbreak of persecution is compelled to fly from Provence to England, where she dies, leaving her child to grow up ignorant of her birth and station. Her identity is at last established by the dying statement of a repentant enemy, and the girl is restored to her father and her rank.

READE, CHARLES. *Peg Woffington and Christie Johnson.* (Chatto and Windus.) 8vo. Paper Covers. Pp. 125. 6d.

At last it seems as if the public were awakening to the fact of what a great writer they were slighting when they allowed the novels of Charles Reade to sink into comparative obscurity. Uniform with the sixpenny edition of "It's Never Too Late to Mend," with Messrs. Chatto and Windus lately produced, this edition of two of Reade's best known stories should do much to popularise the work of one of the very cleverest and most powerful novelists of the century.

REANEY, MRS. G. S. *Dr. Grey's Patient.* (Bliss, Sands and Foster.) Three volumes. 31s. 6d.

Upon her first attempt at serious fiction Mrs. Reaney is certainly to be congratulated: she has not allowed "the very definite purpose of its telling," of which she speaks in her preface, to interfere with the proper progress of her story; and she has almost entirely resisted the temptation to moralise upon its different incidents. "Dr. Grey's Patient" is the story of a young girl's life and of her difficulties from the moment of her doubtful birth to her marriage. In many ways it is sad reading, but it is full of reality, and it is certainly likely to fulfil with its readers the mission which its authoress set herself of helping to warn in time the many girls "who start on life's journey without any conception of its pitfalls." The one or two risky situations which such a story must hold Mrs. Reaney has treated with great delicacy.

RHOADES, WALTER C. *The Story of John Trevennick.* (Macmillan.) Crown 8vo. Cloth. Pp. 421. 3s. 6d. New edition.

RUSSELL, W. CLARK. *The Wreck of the "Graysvorn."* (Sampson Low.) Crown 8vo. Cloth. Pp. 382. 2s. 6d.

The first volume of the new edition of Mr. Clark Russell's novels, uniform with the editions of Mr. William Black, Mr. Thomas Hardy, and Mr. R. D. Blackmore, that Messrs. Sampson Low are now publishing. The present volume contains as frontispiece a colotype portrait of Mr. Clark Russell as a merchant sailor at the age of seventeen. It is a pity that the publishers throughout these new editions have not adopted Messrs. Macmillan's excellent plan of printing on the fly leaf of each volume the dates of previous editions.

SAINTSBURY, GEORGE (Editor). *Henry Fielding's "Amelia."* (J. M. Dent and Co.) Three volumes. Fcap. 8vo. Cloth. 7s. 6d. net. Illustrated.

In his introduction, Mr. Saintsbury defends "Amelia" against the charges of those critics who have pronounced it inferior to Fielding's two earlier novels, and says that "if we ask ourselves whether it is not as good as 'Joseph Andrews' or 'Tom Jones,' we shall, I think, be inclined to answer rather in the affirmative than the negative." We have already praised the general appearance of this edition.

SAINTSBURY, GEORGE (Editor). *Henry Fielding's "The History of the Late Mr. Jonathan Wild the Great."* (J. M. Dent and Co.) Fcap. 8vo. Cloth. Pp. 227. 2s. 6d. net.

The tenth volume in Messrs. J. M. Dent's edition of Fielding's works. In his enthusiastic introduction Mr. Saintsbury considers the influences which have worked against the popularity of "Jonathan Wild," and says that he would rank it in its own class only second to "The Tale of a Tub." "Fielding has written no greater book." It is one of those books, he says, which must find fit readers or none: not to every one is it granted to appreciate its intense irony and its truth to life. It appears that the publishers had not at first intended to include it in this edition, and it was only upon Mr. Saintsbury's earnest representations that they were induced to do so.

SAVILLE-CLARKE, CLARA. *The World's Pleasures.* (Bliss, Sands and Foster.) Paper covers. 1s. 6d.

The Modern Library with which Messrs. Bliss, Sands and Foster have started their career as publishers is certainly to be very modern indeed if it is to con-

tain many volumes written after the pattern of "The World's Pleasures." Not that Miss Saville-Clarke's material or method of treatment is particularly novel or modern, but one feels that in these five little sketches she has done her best to present various phases of modern life as she sees them, and that any weakness of handling and unskilful grouping is due not so much to carelessness as to inexperience. The book is at least an earnest attempt, and although all five sketches are depressing—the book's title is not a success; it is only clumsily satirical, for it is of disenchantment with life that Miss Saville-Clarke writes—one reads them with a pleasing sense that the author has a serious aim which is likely to gain fuller expression in future volumes.

SCOTT, SIR WALTER, BART. *The Pirate*. (A. and C. Black.) 8vo. Cloth. Pp. 478. 5s. Dryburgh edition.

THEODOLI, MARCHESSA. *Under Pressure: Scenes from Roman Life*. (Macmillan.) Crown 8vo. Cloth. Pp. 397. 3s. 6d. New edition.

VEITCH, SOPHIE F. F. *Margaret Drummond, Millionaire*. (A. and C. Black.) Three volumes. 31s. 6d.

Miss Veitch is to be congratulated; she has produced a novel which, if somewhat over-long and here and there suspiciously didactic, is a original in scene and treatment, and which hardly ever fails to hold fast the interest of the reader. Miss Drummond is an English girl who, through the death of a distant relation, unexpectedly comes into a large fortune and a small but fully inhabitable island off the west coast of Scotland. She takes her mission as a millionaire seriously, and decides, not like Lady Sitcey Nestor, to found a newspaper, but to devote both her life and her money to improving her property and rendering happier the lives of her tenants. The rough Scotch folk, however, look upon her well-meant efforts with disfavour, and as she happens to have upon her land one or two of the greatest rogues and hypocrites in Scotland, she has to put up with much opposition, misrepresentation, and ill-natured gossip, before she has, at last, to give up waging her fight singly and to take refuge in marriage with a middle-aged Scotch colonel. Some of the characters are excellent: there is a touch of tragedy in the dour Presbyterian clergyman, whose love for Miss Drummond drives him into insanity; and Matthewson, the independent oil fisherman, is well drawn, although it is difficult to understand his behaviour when he finds, at last, that Miss Drummond's plans will interfere with his own projects.

HISTORY.

A'BECKETT, GILBERT ABBOTT. *The Comic History of England from Julius Cæsar to George II.* (Dicks.) 8vo. Cloth. Pp. 339. 2s. Paper covers, 1s.

An exceedingly cheap and well printed edition, with all John Lee's original illustrations, of this very amusing history. Certainly its production for a shilling is little short of marvellous.

ALLEGROFF, A. H., M.A. *The Making of a Monarchy: A History of Rome, 76-31 B.C.* (W. B. Clive.) Crown 8vo. Cloth. Pp. 244. 4s. 6d. University Correspondence College Tutorial Series.

A clearly written summary of the chief events in Roman history between the death of Sulla and Octavian's defeat of Antullus. For so small a book it contains a great deal of information; but 31 B.C. is not the date when the monarchy, that is to say the principate, was "made." If a single date must be given for this it should be 27 B.C.

DUFFY, SIR CHARLES GAVAN (Editor). *Thomas Davis's "The Patriot: Parliament of 1869."* (T. Fisher Unwin.) 16mo. Paper covers. Pp. xciv., 172. 1s.

The first volume of the New Irish Library, including a lengthy introduction upon Thomas Davis's work by the editor.

O'CONNOR, T. P., M.P. *Sketches in the House: The Story of a Memorable Session*. (Ward, Lock and Bowden.) Paper covers. Pp. 288. 1s.

A reprint of the vivid and, in many ways, admirable parliamentary sketches which appeared week by week in the *Week's Sun*, during the past session, under the title "At the Bar of the House."

MISCELLANEOUS.

A *Manual of the Typewriter: A Practical Guide to Commercial, Literary, Legal, Dramatic, and all Classes of Typewriting Work*. (Isaacs Pitman.) 8vo. Cloth. Pp. 93. 3s. 6d. With plates.

BARRETT, THOMAS SQUIRE. *Magic Squares: An Introduction to the Study of their Formation*. (Slater, Berkhamsted.) Crown 8vo. Cloth. Pp. 32. 1s. 6d.

BURDETT, HENRY C. *The Uniform System of Accounts: Audit and Tenders for Hospitals and Institutions*. (Scientific Press.) 8vo. Cloth. Pp. 76. 6s.

Classified Digest of the Records of the Society for the Propagation of the Gospel in Foreign Parts, 1701-1892. (19, Delahay Street, Westminster.) 8vo. Cloth. Pp. 980. With portraits.

Laundry Wrinkles for the House and Factory. (Laundry Journal Office, 29, Ludgate Hill.) 8vo. Paper Boards. Pp. xiv., 79. 2s. 6d.

NOAKE, SERGT.-MAJOR S. G. *A System of Free Gymnastics and Light Dumb Bell Drill*. (Gale and Polden.) Small square. Cloth. Pp. 76. 1s. 6d. With plates.

SALIS, MRS. DE. *Dogs: A Manual for Amateurs*. (Longman.) Half cloth. Pp. 120. 1s. 6d.

The Art of Projection and Complete Magic Lantern Manual. (E. A. Beckett, 111, Kingsland Road, N.E.) 8vo. Cloth. Pp. 170. 4s. 6d.

The Insurance-File, 1893. (W. J. West, 21, Godliman Street.) Paper Boards. Pp. 237. 2s.

This annual reproduces by photography all the reports and accounts annually published by the different life assurance companies in Great Britain.

TOPHAM, JOHN. *The Temperance Science Reading Book*. (Jarrold.) Crown 8vo. Cloth. Pp. 245. 1s. 6d. Illustrated.

POETRY, MUSIC AND THE DRAMA.

BARROW, SIR JOHN CROKER, BART. *The Seven Cities of the Dair, and Other Poems, Lyrics, and Sonnets*. (Longman.) Crown 8vo. Cloth. Pp. 136.

There is a good deal of imaginative power and some little skill in the lengthy title-piece of this volume, but we fear that Sir John Barrow is hardly justified in giving to the rest of the collection the broad title of "Poems."

GRAY, ALAN. *Rock-Buoys Bell*. (Novello.) 8vo. Paper covers. Pp. 80. 1s.

Ballad for chorus and orchestra, with words by Susan K. Phillips.

PARRY, DR. C. HUBERT H. *Summary of Musical History*. (Novello.) Paper covers. Pp. 116. 2s.

An interesting volume in the series of *Musical Primers* edited by Sir John Stainer. Being a summary of the history and development of modern European music, it contains many useful notes on the great composers, but alas! there is no index!

ROBERTSON-HICKS, MAUDE. *Flowers from Overseas and Other Verses*. (George E. Over, Rugby.) 18mo. Paper boards. Pp. 69.

In this dainty little volume six pieces at most there are worth printing; the remainder, with but few exceptions, are of the most trifling description; one feels that the authoress would have been far better advised to have postponed her appeal until she could have included more poems as charming as "Lilac," "April," and "A Mystery." That she admires "A Country Wife" is certain, but the tinge of imitation sits gracefully upon her best verses, and the reader is not dissatisfied. "In a Volume of Amy Levy's Poems" is a feeling and of the right kind of sympathy, and is one of the most successful pieces in a book in which the verses which are of promise are almost hidden by the which did not deserve printing.

SAINTSBURY, GEORGE (Editor). *The Poetical Works of John Herick*. (George Bell and Sons.) Two volumes. Fcap. 8vo. Cloth. Pp. liii., 293, 308. 2s. 6d. each, net.

It might have been thought that after Mr. A. W. Pollard's delightful scholarly edition of Herrick, to which Mr. Swinburne contributed a critical introduction, in the Museum Library, there was no need for a further excursion into the same field, even by an editor so fit and so accomplished as Mr. George Saintsbury. The All the Edition of the British Poets, however, has been incomplete without Herrick, and after all Mr. Saintsbury is an excellent critic that even though one has Mr. Pollard's, one is glad of additional information to be found in this new edition. Mr. Saintsbury has adopted Mr. Pollard's plan of separating the epigrams of a certain class from Herrick's better work, but has printed them in the original order, and has included an appendix containing the poems attributed to Herrick, but published in "Heperiles," an appendix of variants, and an excellent list of first lines. His introduction is, as might have been expected, a model of sense and critical ability, and the annotation "has been designedly kept out of its lowest terms."

SIGERSON, DORA. *Verses*. (Elliot Stock.) Crown 8vo. Cloth. Pp. 131.

As the first venture of a new writer, this collection certainly deserves a place among the promising minor poetry of the year. The genius of Miss Sigerson's subtle and sympathetic is considerable, her command over words not inconsiderable, and there is more than one poem in the volume which deserves re-reading. "The Leper's Betrothal," for instance, is powerful, imaginative, and alone marks Miss Sigerson's future books out as worth watching for.

Tom Hood's Complete Poems. (John Dicks.) Crown 8vo. Pp. 237. Paper covers, 61. Cloth, 1s.

All things considered, this is an exceedingly cheap and creditable edition of Hood's poems. The print, of course, is small, but it is fairly clear, and

large number of illustrations by Hood himself, D. H. Friston, and George Cruikshank have been reprinted with the text.

TOURS, BERTHOLD. A Festival Ode. (Novello.) 8vo. Paper Covers. Pp. 20. 1s.

A setting of an ode by Canon Bell, produced at the recent Cheltenham Festival.

SCIENCE, NATURAL HISTORY AND PHILOSOPHY.

COOKE, C. J. BOWEN. British Locomotives: Their History, Construction, and Modern Development. (Whittaker.) Crown 8vo. Cloth. Pp. 381.

This volume is addressed particularly to the large class of people who, without being connected with this particular branch of engineering, take an interest in railway working and locomotives. Mr. Cooke has attempted to strike a mean between those books which have already appeared and which are technical and purely scientific in character, and those which, treating the subject from a non-professional point of view, do not give much idea of the principles of working or construction. The book is very admirably and very profusely illustrated, both in black and white and in colours, modern locomotives particularly being well represented, and it contains an index.

GORE, J. E., F.R.A.S., M.R.I.A. An Astronomical Glossary: or, Dictionary of Terms used in Astronomy. (Lockwood.) Fcap. 8vo. Cloth. Pp. 139.

Contains also tables showing the latest values of astronomical constants, details of the planets and satellites of the solar system, and lists of remarkable red, variable, and binary stars.

FAWCETT, EDWARD DOUGLAS. The Riddle of the Universe: an Attempt to Determine the First Principles of Metaphysics, Considered as an Enquiry into the Conditions and Import of Consciousness. (Edward Arnold.) 8vo. Cloth. Pp. 410. 14s.

Mr. Fawcett proposes to find in metaphysics an answer to a question which, he considers, religion and philosophy have alike failed to solve: With what end or meaning is fraught the evolution of man and animals? and of what metaphysical significance are these myths, often so terribly misinterpreted by events? The book is divided into two parts: the first, critical and historical; the second, constructive. The philosophy with which it deals is that of the German School, and is mostly post-Kantian; where classical or oriental metaphysics are touched upon they are treated in the form of popular and modern restatement.

JAPP, ALEXANDER H., LL.D. Hours in My Garden and Other Nature Sketches. (Hogg.) Crown 8vo. Cloth. Pp. 340. 6s.

Dr. Japp expresses a hope in his preface that young folks may derive from his pages some stimulus to a systematic study of nature. The book contains nearly a hundred and fifty illustrations by Mr. W. H. J. Boot and others.

NICHOLSON, J. SHIELD, M.A., D.Sc. Principles of Political Economy. Volume I. (A. and C. Black.) 8vo. Cloth. Pp. 451. 15s.

This work is intended, says Professor Nicholson, "to cover the same ground as that of Mill, and whilst presenting the older doctrines takes account also of subsequent modifications." He also says in his preface that it must be regarded not so much as an abstract of the opinions of others as an independent attempt to recast the subject in the light of these opinions; and that he owes far more to Adam Smith than to Mill.

THEOLOGY.

BROOKS, RT. REV. PHILLIPS, D.D. The Mystery of Iniquity and Other Sermons. (Macmillan.) Crown 8vo. Cloth. Pp. 362. 6s.

Twenty sermons by the late Bishop of the Diocese of Massachusetts.

Common Sense Theology: A Second Series of Tracts for the Times. (British and Foreign Unitarian Association.) Crown 8vo. Cloth. Pp. 161. 2s.

Inspired by the success of the first series of "Tracts for the Times," the Unitarian Association decided to publish the second series. Among other papers are three by the Rev. Stopford A. Brooke, on "The Resurrection of Jesus," "The Universal Pentecost," and "The Main Lines of Religion as Held by Unitarians."

EXELL, REV. JOSEPH S., M.A. The Biblical Illustrator: The Acts. Volume II. (Nisbet.) 8vo. Cloth. Pp. 639. 7s. 6d.

FARRAR, FREDERIC W., D.D., F.R.S. The Lord's Prayer and other Sermons. (Isbister.) Crown 8vo. Cloth. 3s. 6d.

This series of eighteen characteristic sermons has a preliminary discourse on prayer in general, taking afterwards the Prayer itself clause by clause. The petition "Deliver us from evil" affords matter for no fewer than four sermons, dealing with the reality and the root of evil, and the means of delivery; and two are occupied with the word Amen—its meaning and its congregational use. With great variety of diction, of quotation, and of anecdote, with special use of the weapons of scorn and denunciation, and indeed with the whole armoury of rhetoric, Dr. Farrar forces on us the simple lesson that "religion is neither a petty ceremonialism nor an ecclesiastical system, but a good heart and a good life."

FLETCHER, REGINALD J., M.A. The Old Law and the New Age. (Bell.) Crown 8vo. Cloth. Pp. 140. 3s. 6d. net.

Ten sermons which were preached in the church of St. Saviour, South Hampstead, on such subjects as Irreverence, The Lord's Day, The Family, Staling, The Unruly Member.

Our English Ministers. (Isbister.) Crown 8vo. Cloth. 3s. 6d.

A first impression of this book is that of incompleteness, as it deals with only seven of our many famous churches. Those are, however, described most thoroughly. The preface states that the publishers hope to continue the list, and issue a second volume. Naturally, Westminster Abbey takes the place of honour, and of course the paper falls to the lot of Archbishop Farrar. The chief harm of this most interesting paper lies in the fact that the writer has carefully avoided the repetition of such facts as may be gleaned from the guide-books, and has sought rather to draw attention to those hidden links in the chain which too often pass unnoticed. The book is profusely illustrated.

SALMOND, PROFESSOR, D.D. The Parables of Our Lord. (T. and T. Clark, Edinburgh.) 18mo. Paper Covers. 6d. Bible Class Primers.

SHEARMAN, REV. J. N., A.B. Gradual Catechising. (Griffith and Farran.) Crown 8vo. Cloth. Pp. 287. 2s. 6d.

WESTCOTT, REV. ARTHUR, M.A., and REV. JOHN WATT, D.D. Concise Bible Dictionary: A Supplement to "Book by Book." (Isbister.) Crown 8vo. Cloth. Pp. 175. 2s. 6d.

TRAVEL, GEOGRAPHY AND TOPOGRAPHY.

BACON, G. W., F.R.G.S. Illustrated Guide to London and the Suburbs. (G. W. Bacon.) Paper Covers. Pp. 98. 6d. With large map.

BARTHOLOMEW, JOHN, F.R.G.S. Gazetteer of the British Isles, Statistical and Topographical. (Bartholomew, Edinburgh.) Royal 8vo. Cloth. Pp. 879. 12s. 6d.

A cheaper edition, including as a supplement the results of the 1891 census and several new statistical appendices. It is in every way a very admirable gazetteer.

BROWNE, EDWARD G., M.A., M.B. A Year Amongst the Persians. (A. and C. Black.) 8vo. Cloth. Pp. 594. 21s.

A series of impressions as to the life, character, and thought of the people of Persia, received during twelve months' residence in that country in the years 1887-8. The book contains a coloured map of Persia and an index.

COUSINS, GEORGE. From Island to Island in the South Seas; or, The Work of a Missionary Ship. (Snow.) Crown 8vo. Cloth. Pp. 128. 1s. Illustrated.

HARRIS, GEORGE W. The Practical Guide to Algiers. (Philip.) Fcap. 8vo. Cloth. Pp. 176. 3s. 6d. Fourth edition, revised. With maps and illustrations.

JOHNSON, W., B.A. City, Rice-Swamp, and Hill. (Snow.) Crown 8vo. Cloth. Pp. 224. 2s.

One of the series of Missionary Manuals, containing numerous illustrations.

LEES, G. ROBINSON, F.R.G.S. Jerusalem Illustrated. (Gay and Bird.) 8vo. Cloth. Pp. 163.

This is the first English book to be printed and published in Jerusalem, the illustrations, which are excellent, being from photographs taken by the author himself. A short commendatory preface is by the Right Rev. Bishop Blyth, of Jerusalem.

WILLIAMS, MONTAGU, Q.C. Round London, Down East, and Up West. (Macmillan.) Crown 8vo. Cloth. Pp. 244. 3s. 6d. New edition.

NOTICE.—For the convenience of such of our readers as may live at a distance from a bookseller, any Book they may require, mentioned in the previous List, will be forwarded post free to any part of the United Kingdom, from the Publishing Office of the REVIEW OF REVIEWS, 125, Fleet Street, on receipt of Postal Order for the published price of the Book ordered.

CONTENTS OF REVIEWS AND MAGAZINES.

ENGLISH AND AMERICAN.

Altruistic Review.—21, Quincy Street, Chicago. October 15. 20 cents
John Cramer. Hazlitt A. Cuppy.
Hull House: A Chicago University Settlement.

Amateur Work.—Ward, Lock, Salisbury Square. November. 61.
The Reflecting Telescope. Illustrated. E. A. Francis.

MR. GLADSTONE AND HIS GRANDCHILD DOROTHY.

(From a photograph taken at Hawarden on October 13, 1893, by Messrs. Valentine and Sons.)

THE PROGRESS OF THE WORLD.

LONDON, *December 1, 1893.*

Fleet Street and South Africa. The progress of events in Matabeleland last month has naturally been followed with keen anxiety by the public at home. It is to be regretted that in the case of many of the more forward of commentators, intelligence has by no means kept step with interests. The jabbering of monkeys in a bamboo tope could hardly be more inane than most of the comment which has been printed in Fleet Street upon South African affairs. Fortunately, the chatter of the simian race is not one of the determining factors in the evolution of our Imperial destinies. John Bull having, by rare good fortune, secured the presence of the ablest of his sons in the position of danger and responsibility, is not such an idiot as to interfere with him because of the cluttering crew of irresponsible carpers in Fleet Street.

Free Hand for Mr. Rhodes. It is necessary to speak out clearly and with emphasis in this matter. Mr. Rhodes is the ablest man in South Africa. For my own part, I have long ago recognised him as an abler Imperial statesman than any man whom I have ever met—bar none—at home or abroad. But not even his bitterest enemies will deny that in South Africa he is absolutely without a rival for ability, for a knowledge of the facts, and for what is still more important, a knowledge of his own mind. But Mr. Rhodes is not only a supremely able man. He is the man of all others who is most weighed down by responsibility. He is bound over to keep the peace, and to avoid any war that can possibly be avoided by obligations, both public and private, as weighty as ever were imposed upon a statesman. His own personal and public interests coincide with our interest. He is at the front. He knows his facts.

He knows his men. He knows to a nicety his resources and his limitations. Why, then, in the name of common sense can we not leave him alone, instead of screaming ourselves hoarse at a distance of thousands of miles lest he should do something of which in our necessary ignorance and irresponsibility we might haply disapprove?

The only True Policy. The question involved in this *charivari* of carping criticism goes to the root of the whole problem of empire. It is much wider than the mere local issue in Matabeleland. Fleet Street has yet to make up its mind, once for all, that the only way in which the Empire can be maintained and defended, before it could be extended, is by a resolute refusal on the part of ill-informed irresponsible critics at the rear to interfere with the freedom of action of our well-informed responsible representatives at the front. Choose your ablest man, lay down the general outline of the policy which you wish to be pursued, saddle him with the full burden of responsibility, and then—leave him alone to deal with the crisis which you in your editorial sanctum cannot cope with, no—not although you print acres of leading articles and waste oceans of printer's ink. Get your ablest man, agree with him as to your policy, and then in the name of common sense give him a free hand and all the backing that he needs. The opposite course was tried at Khartoum, with results which still sting and burn in the memory of our race. Do not let us make criminal idiots of ourselves a second time by worrying Mr. Rhodes in Matabeleland.

The Real Difficulty in Matabeleland. The real difficulty in these regions is not the overbearing, dictatorial power of Mr. Rhodes, but the fact that Mr. Rhodes with all his power is of necessity compara-

tively impotent. Mr. Rhodes, if he could, would have prevented the Matabele war. His interest was peace. But just as the impi forced the hand of Lobengula, so the forces at the front rendered it impossible for Mr. Rhodes to avert the outbreak of hostilities which he had honestly and anxiously striven to avert. It was his obvious interest to avoid fighting. How obvious will appear much more clearly when the real difficulties of the situation disclose themselves. If he can even now capture or make terms with Lobengula, he may emerge from the campaign with flying colours. If, on the other hand, he should have to retire before the rains which render the country impassable, with every prospect of having to renew the campaign in the Spring, his position will be one of such difficulty,

who left 1000 dead on the field, and the flight northward of Lobengula. On the 2nd the victors, who had lost in both battles very few men, entered Buluwayo and found it deserted, the Royal kraals having been burned and the Royal magazine blown up—by order of the retreating monarch. Meantime the Imperial troops under Major Goold-Adams, who were moving on the same centre, had a slight skirmish with another impi, after which King Khama with his 1700 men turned back to Palapye, on the plea that smallpox had broken out. Major Adams reached Buluwayo on the 13th, and joined there the Company's forces. Dr. Jameson reported on the 18th that the Matabele were "entirely broken up," and that the capture of Lobengula, after whom a special detachment had gone in pursuit, was expected every

MAJOR GOOLD-ADAMS.

DR. C. S. JAMESON.

COLONEL SIR F. CARRINGTON.

that it would be unpatriotic and ungenerous to the last degree to aggravate it by a campaign of slander at home. Every consideration of patriotism and of common sense should lead us to uphold the honour of the great Elizabethan Englishman who answers for South Africa in the counsels of the Empire.

Buluwayo taken.

The progress of the war may be shortly stated. On October 23rd the combined Fort Victoria and Fort Charter columns, numbering 1800 men, under command of Dr. Jameson, were attacked in laager near the Shangani river, thirty-five miles from the Matabele capital, by an impi of some 5000, who were defeated and driven back with a loss of 500 men. The Company's troops pressed forward towards Buluwayo, and on the 1st of November were assailed by the Royal army 7000 strong. The result was a total rout of the Matabele,

day. Subsequent rumours of capture have been frequent. On the 27th the Bechuanaland police left Buluwayo to prevent the king's brother-in-law, Gambo, who is at the head of 4000, joining the fugitive. More fighting is thus still possible.

One pleasing proof that the Imperial Our Naval Supremacy. temper has not quite died out amongst us is the unanimity with which all parties

insist, at least in words, on the maintenance of our naval supremacy. The approaching expiry of the Naval Defence Act; the apprehensions aroused by the Franco-Russian Alliance, and the opening of French harbours in the Mediterranean to Russian men-of-war, together with the comparative weakness of our fleet in those waters, has given rise to a vigorous agitation with a view to making our Navy what it should be. The absolute necessity of our maintaining the command of all

the seas is happily becoming more and more evident, even to minds not generally suspected of Imperial enthusiasm. Mr. John Morley, speaking at Manchester, declared that we must maintain an "all-powerful" navy. Lord Charles Beresford requires as the minimum standard of efficiency that we should possess a fleet one-third greater than any possible combination of two hostile fleets. At present we are far below that point. To reach it we shall require an outlay of several millions. Mr. Gladstone expresses himself perfectly satisfied with the capacity and adequacy of our present fleet. It remains for all those who value our Empire and our trade, with all that these involve for the future of mankind, to insist that the aspirations expressed by Lord Spencer on the one hand, and Mr. John Morley on the other, are fulfilled to the letter.

The death of Sir Robert Morier, who **The Vacant Embassy.** has for so many years represented Britain at St. Petersburg, is a great loss to the cause of European peace. Sir Robert Morier was trusted by the Tzar (who, as it is now generally admitted, is the real keeper of the peace of the Continent), more than any British Ambassador who has been sent to Russia since he came to the throne. It will be most difficult to replace Sir Robert. Even if the best man were secured, he could not step at once into the position which his predecessor had won by years of honest, sturdy, straightforward diplomacy. The peace of the world depends on the Tzar, and it is of supreme importance that the man who speaks for England in the Russian Court should have his confidence, and should be a man of transparent honesty and simple truthfulness. Sir Robert was any thing but a diplomat in the usual sense of the term; he was often a very clumsy bull in a very crowded china-shop; but he was a man of his word. He had brains enough to understand where the truth lay, and courage enough to speak plainly when occasion arose. The selection of his successor will be the most difficult and delicate task that has fallen to Lord Rosebery's lot since he became Foreign Minister.

Sir Robert Morier. Of Sir Robert Morier personally, I find it difficult to write without genuine emotion. He was a man who alike for his qualities and for his defects left a very deep and lasting impression upon the minds of all his friends. The late Lord Derby told me that Sir Robert had more knowledge of men and affairs in modern Europe in his little finger than all the rest of the diplomatic corps possessed in their combined heads. Although

this was an exaggeration there was some truth in it. Night after night I have sat up till two and three

SIR ROBERT MORIER.
(From a photograph by Walery.)

o'clock in the morning at the Embassy on the Neva, hearing this extraordinary man discourse in unending monologue upon the events of the last quarter of a century, and every time that I left the Embassy I felt that his immense store of information had but been sampled. For Sir Robert Morier had studied the transformation of modern Europe from behind the scenes. He knew everyone, had been everywhere, and could throw a flood of vivid light upon almost all the incidents of modern history. Not dry light, or colourless light, by any means; for Sir Robert was a man of fierce antipathies and strong predilections. He was a Berserker of a man in some things. His language, when he let himself go, was something to remember rather than to repeat; but these idiosyncrasies added to the fascination of his discourse. Like many men of his type, he was a pessimist in Home Politics. Home Rule made him foam at the mouth; but he loved his country with a passionate devotion, and almost to the last he cherished hopes that he might be able to serve her in the Senate. He was a man bursting with information, and he inundated his chiefs with despatches which were often too long for the patience of

the Foreign Secretary, who as a rule does not care for encyclopedic knowledge served up in despatches. Sir Robert was by nature a journalist rather than a diplomatist, and he very narrowly escaped being an editor instead of an ambassador. In St. Petersburg he recognised the opportunity his position afforded him of promoting the peace of the world and the overthrow of Prince Bismarck, and before he died he had the rare satisfaction of feeling that in both objects he

THE LATE PRINCE ALEXANDER.

(From a photograph by Carl Bachofen, Darmstadt.)

had been completely successful. The same month which records the death of the Ambassador who has done so much to promote friendly feeling between Russia and England, has witnessed the decease of the brilliant young adventurer, Prince Alexander of Bulgaria, whose personal influence among British Royalty it was once feared might have involved this country in hostilities with the Tzar.

The Close of the Coal War. At last, after a civil war of sixteen weeks' duration, peace reigns throughout coal-getting England. The settlement was most welcome, but even more satisfactory was

the final method of settlement. The closing stages of what has proved to be one of the greatest industrial struggles of the generation need to be stated with some detail. The first attempt made during the month to put a stop to the strife ended in failure. Representatives of miners and mine-owners met at the Westminster Palace Hotel on the 3rd and 4th, only to part without achieving agreement. The masters proposed the formation of a Board of Conciliation to decide the rate of wages, the immediate resumption of work by the men at a reduction of fifteen per cent., and the payment of this fifteen per cent. into a bank, pending the decision of the Board, to be made over to the men or to the masters as the Board should decide. The miners agreed to the formation of a Conciliation Board, and to its fixing the wages to be paid after the first of April next, but insisted that in the interim work should be resumed at the old rate of wages, and that the Board should be precluded from making a greater reduction than that of ten per cent. Thus the dispute had narrowed. The negotiable limits were now, on the one side, the coal-owners' fifteen per cent. forthwith, and, on the other, the miners' ten per cent. from April 1st. But neither party would yield the intervening five months and five per cent. The deadlock remained as grim as ever. Winter was coming on. The area of dominant hunger and cold spread far beyond the mining districts. The enormous rise in the price of coal meant misery to the poor everywhere, and the scarcity of fuel involved general dislocation of national industry. For nine days the outlook was very black.

The Good Offices of the Government. Then, "at last, though late," Government awoke to a sense of its functions. The primary duty of Government is, after all, not to win partisan triumphs over fellow-citizens, but to maintain civil peace and to protect the nation as a whole from being sacrificed to private cupidity or stupidity. If two men try to settle their quarrel by the help of bludgeons, the State intervenes at once; but a conflict directly involving hundreds of thousands of citizens, and waged with the deadly weapons of starvation and resolute inaction, constitutes a much more serious breach of social order. Long before a privateer had inflicted on the national commerce an infinitesimal proportion of the damage which has resulted to it from this Coal War, the Government cruisers would have been on her track. But a third of a year of intense national suffering must elapse before either Government or people are ready to allow the State

to interpose as industrial peacemaker. However, "better late than never." Mr. Gladstone's letter of the 13th ult. caught the psychological if not the logical moment. His wisely-worded proffer of Lord Rosebery's good offices, not as umpire or arbitrator, but simply as friendly host and presiding mediator, evoked general and enthusiastic approval. The Miners' Federation and the Federated Coalowners

ARTHUR MARSHALL CHAMBERS, CHAIRMAN OF THE COALOWNERS' FEDERATION.

(From a photograph by Haenisch, Vienna.)

promptly acceded to an "invitation," which virtually embodied a national command. The Conference at the Foreign Office on the 17th was as fortunate in issue as in inception. A single day under Government influence sufficed to effect what had been fruitlessly attempted in a long series of local and municipal negotiations.

The agreement arrived at is marked by mutual concession. The miners won the immediate and manifest victory of resuming work at the old rate of wages, pending the decision of the Board of Conciliation. But the men conceded that the Board's decision should take effect from February 1st, and not, as they had urged, from April 1st. The masters, that is, yielded two-and-a-half months, the men only two months, of the period in dispute. The balance of victory on the side of the men thus amounts, when measured in time, to barely half a month. On the other hand, the men gave up what had been declared to be the very backbone of their contention, the prescribing to the Board of a minimum wage. There is not a

word about the minimum wage in the Rosebery settlement. Its terms leave the Board free to fix the miners' wage without predetermined limit, either upward or downward. No doubt the stand which the miners have made for what they take to be "the living wage" will have its moral influence on the deliberations of the Board; but "the living wage" has found no express acknowledgment in the terms of the treaty.

Arbitration The result is a twofold triumph. It is **Victorious at Last.** a triumph of the principle of arbitration. The fourteen representatives from each side in selecting a neutral chairman virtually appoint an arbitrator. It is a triumph of the further principle that the promotion of industrial peace is one of the duties of the State. The possible nomination of chairman by the Speaker is a picturesque reminder of the fact that the State is not less interested in maintaining order amid the economic than among the political disputes of the nation. The precedent is certain to be largely followed. Already trade organisations have begun to ask for its systematic adoption by the Labour department. Some day, the Coal War of 1893 will seem as much a piece of civil barbarism as the Wars of the Roses. How largely popular sympathy has gone with the miners may be inferred from the amounts which have been subscribed for their relief. The *Daily Chronicle* alone has won from its readers more than eighteen thousand pounds.

The Church and the Labourer. By their straightforward and resolute use of the opportunity the Government have gained almost as much as the Churches lost by the halting and pusillanimous conduct of the Jerusalem Chamber conference on the 14th. The Conference at Holborn Town Hall on the 29th, even though it met nearly a fortnight after the termination of the coal struggle, did something to remove the stigma of cowardice. To insist on "a living wage," to interpret that term to mean "such a wage as shall enable the workers to maintain healthy and human homes," and to invoke for the help of Boards of Conciliation "the best conscience of the community," were excellent steps to take; but they impose upon the churches adopting them the further duty of specifying more precisely their meaning for different industries and different districts. To get this done there will have to be a vigorous and extensive adoption of the idea of the Civic Church. Whether or not the religious bodies will so far forget their differences as to unite in promoting "the Christian organisation of industry,"

their interest in these questions is undoubtedly deepening. It has received picturesque illustration in the fact that Mr. Tom Mann has seriously contemplated taking orders in the Church of England. His idea was, if possible, to capture the Church for the Labour movement and the Labour movement for religion; but, though personally approached by the Archbishop of Canterbury, Mr. Mann has wisely decided not to become a priest. He will probably devote himself to Labour politics, which offer a freer and, possibly, a more exciting career. The Independent Labour Party have

officially abjured both of the historic parties. The Fabian Society has distinguished itself by a manifesto similar in substance, but—thanks to the literary gifts of Messrs. Bernard Shaw and Sidney Webb—more polished in form. These threats of revolt, whatever their ultimate effect, may in the meantime help to quicken the pace of social legislation.

Liability of Employers. The Employers' Liability Bill, in spite of alleged obstruction, has safely passed through all stages in the Commons. The

chief interest of the debates centred in Mr. W. McLaren's amendment to allow employers and employed, under carefully specified conditions, the

liberty of "contracting out."

It was stated that the vast majority of the workmen now covered by the mutual insurance arrangements of certain great railway and other companies had voted or petitioned for exemption from the proposed law. But the Commons held, by 236 votes to 217, that citizens, however much they desire to do so, may not

MR. WALTER MCLAREN, M.P.

relieve the State of its obligation to secure for them

that compensation for injury, and that consequent protection from injury, which the Bill has in view. A great landlord undertaking, with the consent of his tenants, to defend their life and property from aggression, might as logically expect to contract himself and his estates out of the

jurisdiction of the police. Mr. Chamberlain got back from America just in time to speak against the Bill on its third reading. His speech will possibly be best remembered by its ingenuous allusion to "his Radical days" and the explanatory confession, "I was a Radical once." It remains to be seen

MR. SIDNEY WEBB.
(Photo by Stereoscopic Co.)

whether the covert obstruction of his present allies will prevent the passage through the Commons of the other measure down for the Autumn Session,—the Parish Councils Bill. What fate either or both of these measures will meet in the Lords is also uncertain. The nearness of Christmas and the tone of Lord Salisbury's remarks at Cardiff on the 28th and 29th discourage any sanguine hopes of much legislative result accruing from this year's session, although it is already the longest Parliamentary year on record.

Growth of Civic Spirit. His disparagement of civic life in its rural developments, and the refusal of certain provincial town councillors, even in face

of fine, to accept the proffered Mayoralty, seem to indicate that the "municipalisation of the individual"—in a sense different from that given to the phrase at the opening of Battersea Town Hall—is by no means complete. The renaissance of municipal London to which Lord Rosebery referred sheds a pathetic interest over the installation of the new Lord Mayor of London, as it certainly deprived the banquet at the Mansion House of some of its glory. How long will it be before the historic "City" loses its life to find it in the larger whole? The same quickened sense of local self-government as is working such a transformation in the metropolis, was disclosed also in the recent quarrel between

the rank and file of the Gladstonian Commons and the Lord Chancellor. The excessive preponderance of one party, or one sect, or one social grade on the County Bench, has not merely weakened public confidence in the impartiality of the administration of justice; it has affronted also that feeling of local responsibility which is the salvation of democratic institutions. Apparently the property-qualification for holding office as a magistrate requires to be reduced by legislation before suitable justices of the peace can be drawn from all classes.

A Perennial Problem.

The local authorities, and the local authorities alone, are, by Mr. Gladstone's reply to Mr. Keir Hardie on the 28th, left to deal with the ever-more obtrusive problem of the unemployed. The national Government is to limit itself to issuing circulars and Blue-books. In the beginning of the month a Blue-book was published by the Labour Department of the Board of Trade containing much valuable information about methods for dealing with the unemployed, but practically going no further than negative or suspensive criticism; and at the end of the month we are promised a report on the same subject from the Labour Commission.

German Socialism advancing.

The wants and woes of the working man are not the preoccupation of the hour to Great Britain alone. The official statistics of the elections to the Reichstag which was opened in Berlin on the 16th, showed that the Social Democrats had polled more votes than were cast for any other party, and had increased their total in three years by one-third of a million. The Social Democrats have also won further victories in the Berlin municipal elections. The German Emperor, with his genius for dramatic contrast, may hurry from opening the Diet, elected on a wide popular suffrage, to tell 12,000 soldiers freshly sworn, "You must have but one will, and that my will;" but all this parade of military autocracy fails to lay the menacing spectre of the Social Democracy.

The Austrian Crisis.

The crisis brought about by Count Taaffe's valiant endeavour to enfranchise the Austrian working man has ended in the formation of a coalition Ministry composed of Conservatives, German Liberals, and Poles, under Prince Windischgrätz as Premier; but even they have been compelled to admit that an extension of the franchise is inevitable, and to prepare Bills accordingly. The Royal assent to the Hungarian Civil Marriage Bill marks the breaking of another bar to progress in the bi-partite realm.

The Fall of the French Ministry.

But the crisis in France supplies perhaps the most startling illustration of the power of the new Labour or Collectivist movement. The Chambers assembled on the 14th, with a clear majority of 100 for the Moderate Republicans. Against their 325, the Socialists numbered only 50, Radicals and Socialists together only 185. The Ministerial programme was announced on the 21st by M. Dupuy, and wore a strongly anti-Collectivist complexion. He "repudiated all doctrines claiming to substitute the impersonal tyranny of the State for individual initiative," and he would have nothing to do with a progressive income tax, separation of Church and

PRINCE WINDISCHGRATZ.

State, or revision of the Constitution. But the new leaven was at work in his own Cabinet—M. Peytral, the Finance Minister, being wedded to the project of a progressive income tax—and the vigorous Radical criticism in the Chamber coming on the top of the Ministerial dissensions, led to the resignation of Ministers in a body, their majority in the Chamber notwithstanding. M. Spuller, a great friend of Gambetta, who is said not particularly to favour the Russian alliance, was asked to form a new Ministry. Eventually, however, M. Casimir Périer has become Premier and Minister of Foreign Affairs, with M. Spuller as Minister of Public Instruction.

Greece gone Bankrupt.

There has been quite an epidemic of ministerial crises during the month. Austria, Greece, Italy and France have all succumbed. Spain and Portugal have been threatened. The Greek Chamber was opened on the

8th, with the announcement of a certain funding scheme as the only way of escape from financial collapse. Next day the Government was defeated by a majority of more than two to one, and the King, on receiving their resignations, called M. Tricoupis back to power. But not even the new Premier's abilities could cope with the situation. He has had to declare that Greece could no longer fulfil her foreign engagements, and desired therefore to come to "an honourable compromise with her creditors, offering them such terms as the state of the country would permit." The smallness of the Hellenic kingdom does not destroy the importance of the fact that in a continent overburdened with debt the precedent of national bankruptcy has been revived.

THE RIGHT HON. SIR CLARE FORD.
(From a photograph by Maull and Fox.)

Crisis in
Italy.

Greece has fallen into the abyss of insolvency; Italy still reels on the brink. The assistance lent her by German financiers has only postponed the evil day: and an ex-Minister has gone so far as to suggest war as the only way out—a desperate plunge to bring the present tension to an end, which has long been apprehended. Even if the public honour of the Government was unscathed, the private honour of its members was not above suspicion. When the Chamber met on the 23rd, the report of the Committee appointed to inquire into the charges revealed grave irregularities in the dealings of Ministers with the banks. The violent debate which ensued next day, and in which the Premier, Giollitti, was personally denounced, ended in the resignation

of the Ministry. After four days' negotiation, Signor Zanardelli was entrusted with the formation of a new Cabinet. The Right Hon. Sir Clare Ford, G.C.B., has been appointed Ambassador to Rome in place of the late Lord Vivian.

The third Mediterranean peninsula is *The Sorrows of Spain.* also in deep trouble. The sensitive

Spanish honour calls for vengeance on the Riff tribes for their attack on the forts at Melilla. The Sultan of Morocco has tried to preach down the rebellious tribes and to mollify

THE INFANT KING OF SPAIN.
(From "Vanity Fair.")

Spain. But in vain. The Spanish Government has called out the reserves, and to relieve the financial embarrassment voluntary subscriptions have been solicited. The tribesmen are proclaiming a holy war of Moslems against the Nazarenes, and the Spanish clergy seem to be returning the compliment. As Marshal Campos, who has been put in command of the Spanish forces, has arrived at Melilla, bent on vigorous measures, we may soon expect to have sanguinary news. This little war has lasted too long, and lies too near the open gunpowder mine of Europe, not to suggest unpleasant possibilities.

Anarchy Militant. But Spain has worse enemies than the Kabyle hordes. Within her own borders is encamped the army of despair whose strategy is secrecy, and whose weapons are dynamite. The bomb outrages at Barcelona and Granada, as well as the stores of explosives later discovered by the police, attest the activity of the Anarchists. A wave of anarchic passion seems to have been passing over the lands. A bomb was exploded at Marseilles barracks on the 15th. In Paris, on the 20th, a workless man stabbed M. Georgevitch, the Servian Minister—in revenge on Society for allowing him to starve! Infernal machines were despatched on the 23rd, ostensibly from Orleans, to the German Emperor and his Chancellor, von Caprivi, but were fortunately detected in time. In Dublin, a dynamite-box with spent fuse was found on the 26th; a man was arrested with a canister of detonators in his possession, and a suspected informer was shot in the streets. Even in Montreal, three militia officers, one the son of an ex-Premier of Quebec, were detected on the 20th carrying dynamite, presumably for the purpose of blowing up the Nelson Monument. Boyish freakishness, anti-British sentiment, horror of Nelson's immoralities are alleged as cause. An attempt to raise a panic in London on the ground of an Anarchist meeting in Trafalgar Square, which burned the Homo Secretary in effigy, was promptly squashed by the real Mr. Asquith.

The Cabul Mission. The anarchy, tempered by united antagonism to British influence, which was once too largely characteristic of Afghanistan, seems to be developing into stability and friendly alliance. The Cabul Mission has ended happily. Sir Mortimer Durand, after being handsomely entertained and publicly honoured by the Ameer, has returned in safety to British soil. The Afghan ruler has consented to the rectification of a long disputed frontier, and has received in return an increase of fifty per cent. in his annual subsidy.

If the very different mission of Mr. Scott to the Siamese capital only results as pleasantly, the new Viceroy, free from frontier anxieties on East and West, will be able to devote his energies to the enormous internal problems of India. Of these we have been reminded by the Opium Commission, now sitting in Calcutta,—by the minute of Sir A. P. MacDonnell on the tremendous loss suffered by the State in consequence of the present Zemindar system (which turned collectors of Government rents into landlords),—and by the religious dissensions which have made the Moham-medans of the Punjab publicly abjure the Indian National Congress. Lord Elgin will need all the resources of his statesmanship.

THE AMEER OF AFGHANISTAN.

SIR H. MORTIMER DURAND, K.C.I.E.
(From a photograph by Cowell, of Simla.)

Undoing the McKinley Policy. The Silver Crisis which our Indian Government precipitated in the United States, being now allayed by the Repeal of the Sherman Act, the American people are proceeding steadily, if not very blithely, in the pathway of reform. Of the State elections this month which have resulted in great Republican gains, the most cheering are those in New York State, where Independent Democrats united with Republicans in a successful revolt against "Ring-rule" and a corrupt judicature. The Bill for the Revision of the Tariff, which was submitted on the 27th ult., proposes changes which will, it is said, result in a reduction of the revenue to the extent of 50,000,000 dollars. It practically involves the abandonment of the McKinley policy. The effect on the world's trade if the new fiscal tendency is allowed to fulfil itself will be something almost stupendous. The shrewdness of the German Emperor, who encouraged his subjects to exhibit largely at the World's Fair, with the result that they have won a third of the honours divided among sixty-eight competing nations, will doubtless have its reward. The moment seems a favourable one for the negotiations which the Canadian Government has set on foot at Washing-

THE EARL OF ELGIN.
(From a photograph by J. Thomson.)

ton for promoting freer trade relations between the two countries.

This is not the only direction in which Canada and Canada has been fulfilling her destiny as Australasia. mediator of unity among the English-speaking peoples. She has taken the initiative in the admirable policy of establishing closer relations between herself and Australasia. The mission of Mr. Mackenzie Bowell, the Canadian Minister of

SIR THOMAS MCLLWRAITH.

Commerce, to the Governments of the Australian Colonies has evoked gratifying response. As a result, a conference will, it is understood, shortly assemble in Canada to promote trade and to arrange for a cable between the two great Colonial continents. Of the alternative routes proposed for this cable—

HON. HUGH MUIR NELSON.

the shorter crossing French territory and the longer touching British possessions only—the latter alone ought to be considered. The electric link—symbol of what we all hope will become an ever stronger tie—connecting the Dominion and the nascent Commonwealth is much too precious to be exposed for the length of a single inch to the control and caprices of any foreign Power. That Australians are not behind Canadians in the new enterprise is evident from the statement that Sir Thomas McIlwraith has yielded the premiership of Queensland to Mr. Muir Nelson in order to find time for a journey to Canada on this business. The new Premier, who still has Sir Thomas in his Cabinet, is faced with a recrudescence of the separation movement in the north.

How much we in the home country have to learn from these daughter-states was strikingly illustrated last Tuesday, the 28th ult. Then, for the first time, if we mistake not, in the history of the British Empire, women exercised the full political franchise. The electoral law which came into force on September 19th established woman's suffrage in New Zealand. Our Antipodean sisters have shown great promptness in getting their names on the register. On the day of election they voted eagerly, and were welcomed at the polls with enthusiasm. Properly enough the Ministry which enfranchised them has

Woman
Triumphant.

been maintained in power. This is not the only woman's victory which claims record here. Far away to the West, the citizens of Colorado have adopted the franchise for women by a majority of 4,000. This is not so complete a novelty in the Republic as the case of New Zealand is in the Empire, but it is another confirmation of the inevitable tendency of the English-speaking folk. Even in the Old Country, this November, which has been so favourable to the advance of woman, has not passed without its trophies. In the House of Commons, on the 16th ult., on a refusal to accept Mr. W. McLaren's instruction—empowering the Committee to add to the Parish Councils Bill a clause giving the parochial vote to all women, whether married or single, who would, if men, possess the municipal or parliamentary franchise—the Government were defeated by 147 to 126. Accordingly on the 21st Mr. Fowler promised to insert a clause conferring a yet wider franchise: "that no person should be disqualified by sex or marriage from being on *any* local government register of electors or from being an elector for *any* local authority." To this innovation all parties agreed.

The position which the late Prof. Jowett held in the general regard makes the appointment of his successors a matter of national importance. Mr. Ingram Bywater has become Regius Professor of Greek, and Dr. Edward Caird, Professor of Moral Philosophy in Glasgow University, has been elected Master of

PROFESSOR EDWARD CAIRD.
(From a photograph by J. Stuart, Glasgow.)

Balliol. The latter selection especially may be hailed as another indication of the effort the stronger men in Oxford are making to lift their university out of an almost parochial exclusiveness into something like national and catholic life.

DIARY FOR NOVEMBER.

EVENTS OF THE MONTH.

O. & 31. Conference of the Free Labour Association at Clerkenwell.

Conference at the Mansion House on the Unemployed Question.

Mr. Spencer Walpole appointed Secretary to the Post Office.

Council Meeting of the Central and Associated Chambers of Agriculture at the Society of Arts.

Elections to the Prussian Diet.

Resignation of the Austrian Cabinet.

Nov. 1. Municipal Elections throughout England and Wales.

News received of a defeat of the Matabele.

Conference of Liberals, at the National Liberal Club, to consider the Coal Crisis.

Silver Purchase Repeal Bill passed by the United States House of Representatives.

Sentences on Eight Persons accused of Illegal Gambling in Germany.

Conference, at the Westminster Town Hall, on the State Regulation of Vice in India.

Meeting of Postal Telegraph Clerks at the Memorial Hall, Farringdon Street.

2. Shock of Earthquake in Wales and Cornwall.

Cutlers' Feast at Sheffield.

Meeting of the Lower House of Convocation, at Westminster, to discuss the Parish Councils Bill.

Floods in Japan reported.

3. Meeting of Representatives of the Coalowners' and Miners' Federations at Westminster.

Discussion, in the Upper House of Convocation, on the Parish Councils Bill.

Socialist Riots at Vienna.

Captain Williams reported missing from the Chartered Company's Forces.

Fatal Dynamite Explosion at Santander, in Spain.

Armut Rising in Turkey.

4. Gunpowder Explosion at Rio de Janeiro; 2 killed.

End of the French Miners' Strike.

Close of the Conference of Coalowners and Miners; no settlement effected.

Strike of Tramway Employees at Marseilles.

7. Deputation, to Mr. Gladstone, from the Central Committee of the Poor Law Conference on the Parish Councils Bill.

Launch of the *Hermione* at Devonport.

Report received of an Attack on a British Missionary in the Shire Country.

Meeting of the Council of the Liberation Society at the National Liberal Club.

Meeting of Women, at St. James's Hall, in aid of the Miners' Wives and Children.

Central Conference of Women Workers opened at Leeds.

End of the Prussian Elections.

State Elections in America.

8. News of Further Fighting in Matabeleland.

Bomb Outrage at Marseilles; thirty killed.

Opening of the Greek Chamber by the King.

Opening of an Institute of Arts and Science at Carlisle.

Annual Central Conference of Representatives of Poor Law Guardians at St. Martin's Town Hall.

9. Lord Mayor's Day in London.

Banquet at the Guildhall: Speeches by Earl Spencer, Lord Kimberley, Count Torioli, and others.

Resignation of the Greek Ministry.

News of the Complete Defeat of the Matabele.

10. Meeting, at St. James's Hall, in Support of Woman Suffrage.

11. Formation of the New Greek Cabinet with M. Tricoups as Premier.

Gates and Bars removed from Twenty-one London Thoroughfares.

12. Formation of the New Austrian Cabinet with Prince Alfred Windischgrätz as Premier.

13. Sir Clare Ford appointed British Ambassador to Italy.

Colston Banquets at Bristol: Speeches by Mr. Arnold Mori, Sir Michael Hicks-Beach, and others.

Annual Congress of the Sailors' and Firemen's Union.

Public Durbar at Cabul to the Members of the British Mission.

14. Publication of the Final Convention between Great Britain and the Transvaal for the Cession of Swaziland to the Transvaal.

17. The Son of the Comte d'Eu proclaimed Emperor of Brazil.

Settlement of the Coal Trade Dispute.

Deputation, to Sir William Harcourt, from the Friendly Societies' Conference with reference to the Stamp Duty.

18. Disastrous Gales: many lives lost.

Lord Roberts presented with the Freedom of the City of Edinburgh.

Marquis of Huntly elected Lord Rector of Aberdeen University.

First Sitting of the Opium Commission at Calcutta.

19. Municipal Elections in Spain.

Attempted Dynamite Outrage at Montreal.

20. Opening of the St. Bride's Foundation Institute by the Prince of Wales.

Special Meeting of the British South Africa Company at the Cannon Street Hotel.

21. Deputation, to Sir William Harcourt, of Representatives of University Colleges on Government Grants.

Annual Meeting of the Allotments and Small Holdings Association at the National Liberal Club.

Annual Meeting of the Society for Promoting the Return of Women as Poor Law Guardians.

22. Special Meeting of the Court of Common Council to discuss the Unification of London.

Brazilian Rebel Jaxary Inoculated.

23. Deputation from the London Reform Union, to Mr. Campbell-Bannerman, on the Work at the Government Factories.

Budget Statement at the London School Board.

Opening of the Italian Chamber: Parliamentary Report on the Banks.

Lord Roberts presented with the Freedom of the City of Dundee.

Opening of the Austrian Reichstag.

Coal Strike in the West of Scotland began.

The Egyptian Budget passed by the Council of Ministers.

Dispersal of the Matabele.

24. Deputation of railway workers, to Lord Salisbury, on the Employers' Liability Bill.

Sir J. West Ridgway appointed Governor of the Isle of Man.

Resignation of the Italian Cabinet.

25. County Council Bye-Election in North Islington: Mr. T. E. Napier (Progressive) elected.

Resignation of the Serbian Cabinet.

Fall of the French Ministry.

Statement by M. Tricoups on the Financial Situation in Greece.

Mr. Reitz re-elected President of the Orange Free State.

26. Museum Sunday.

Separate Court granted to Hungary.

Funeral of Prince Alexander of Battenberg at Sofia.

27. Opening of the Roumanian Parliament.

MR. EDISON.

[V. Daireaux, Paris]

CHARACTER SKETCH.

THOMAS ALVA EDISON.

IN the World's Fair year, we Americans may be forgiven an excess of national self-consciousness which leads us to ask where we stand among the peoples of the earth; to cast about for the significance of this young trans-Atlantic civilisation.

The answer is writ large over the length and breadth of the continent in our huge railway systems, containing more than half the track mileage of the entire world; in the telegraph lines beside them; in the network of wires over and under our great cities; in the trans-oceanic cables with which, a quarter of a century ago, the Old World was brought within speaking distance of the New, and in the strange machines—telephones, photographs, dynamos,—which have revolutionised our industries and which will certainly revolutionise our whole society. In short, we are a nation of mechanics and inventors.

AN AGE OF ELECTRICITY,
AND EDISON IS ITS PROPHET.

But half a century ago one might have felt secure in asserting that the great engineering triumphs of the age had come through the application of steam. And now, already, the more subtle agency of electricity has thrown the work of Watt and Stephenson and Fulton from the category of marvels and bids fair to supersede it altogether. Steam came but to prepare the way for the ever-present, all-powerful "fluid," and we are being ushered into an age of electricity.

In America there is one unassuming citizen who sums up in his personality and achievements this genius of the American race. If one were to ask what individual best symbolises this industrial regeneration it would be marvellously easy to answer, Thomas Alva Edison. The precocious self-reliance and restless energy of the New World; its brilliant defiance of traditions; the immediate adaptation of means to ends; and, above all, the distinctive inventive faculty reach in him their apogee.

The mere mass of this extraordinary man's work gives in itself a striking idea of the force which he exerts in our material progress. Up to a few days ago the government had granted Edison no less than seven hundred and twenty patents, while he had in addition one hundred and fifty applications on file. And this during a working period that has not yet brought him within many years of the grand climacteric, and much of it accomplished in the face of discouraging financial obstacles.

THE BOYHOOD OF A GENIUS.

For Mr. Edison is but forty-six years of age. He comes of Dutch parentage, the family having emigrated to America in 1730. His great-grandfather was a banker of high standing in New York. Thomas Edison was born in Erie County, Ohio. When he was but a child of seven the family fortunes suffered reverses so serious as to make it necessary that he should become a wage-earner at an unusually early age, and that the family should move from his birthplace to Michigan.

Only four years later the boy was reading Newton's "Principia," with the entirely logical result of becoming deeply and permanently disgusted with pure mathematics. Indeed, he seems to have displayed all the due precocity of genius, one of his notable feats about this time being an attempt to read through the entire Free Library of Detroit!

NEWSBOY, EDITOR, AND
CHEMIST AT FIFTEEN.

Nor was he by any means a youthful bookworm and dreamer. The distinctly practical bent of his character was shown in his operations as newsboy on the Grand Trunk Railway—especially in the brilliant coup by which in 1869 he bought up on "futures" a thousand copies of the *Detroit Free Press* containing important war news, and, gaining a little time on his rivals, sold the entire batch like hot cakes, so that

the price reached twenty-five cents a paper before the end of his route. It was at this period, too, that he was posing as editor of the *Grand Trunk Herald*, a weekly periodical of very modest proportions issued from the train on which he travelled.

He had also begun to dabble in chemistry, and fitted up to that end a small itinerant laboratory. During the progress of some occult experiments in this workshop certain complications ensued in which a jolted and broken bottle of sulphuric acid attracted the attention of the conductor. He, who had been long-suffering in the matter of unearthly odours, promptly ejected the young devotee and all his works. This incident would have been only amusing, had it not been rendered deplorable from the lasting deafness which resulted from a box on the ear, administered by the irate conductor in the course of the young scientist's begonia.

Edison transferred the laboratory to his father's cellar,

MR. EDISON AT FOURTEEN.

and diligently studied telegraphy, establishing a line between his home and a boy partner's, with the help of an old river cable, sundry lengths of stove-pipe wire and glass bottle insulators.

A HEROIC TUITION FEE.

Dramatic situations appear at every turn of this man's life, though from his temperament he would be the last to seek them. He seems to be continually arriving on the scene at critical moments to take the conduct of affairs into his own hands. It was on one of these occasions, when he snatched a station-master's child from before an approaching train, that he earned his first lessons in telegraphy from the father. So apt a pupil was he that the railroad company soon gave him regular employment, and at seventeen he had become one of the most expert operators on the road.

NOT A PRIG BY ANY MEANS.

There was a saving human quality of error in the boy to redeem him amply from the colourless perfection of the story-book model. One is almost glad to hear that he was not by any means a paragon as an operator, and that he played tricks on the company by inventing a device which would automatically send in the signal to show he was awake at his post, while he comfortably snored in the corner. Some such boyish mischief soon sent him in disgrace over the line to Canada. The heavy winter had cut off telegraphic connections and all other means of communication between the place in which he was sojourning and the American town of Sarnier. With characteristic promptness and originality Edison mounted a locomotive and tooted a telegraphic message again and again across the river until the Americans understood and answered in kind.

AMONG THE TRAMP TELEGRAPHERS.

For the next few years Edison was successively in charge of important wires in Memphis, Cincinnati, New Orleans, and Louisville. He lived in the free and easy atmosphere of the tramp operators—a boon companion with them, yet absolutely refusing to join in the dissipations to which they were professionally addicted. He has always been a total abstainer and a singularly moderate man in everything but work, for which he is a perfect glutton. Many are the stories current of the timely aid given his rollicking colleagues when their potations had led them into trouble. It was their custom, when a spree was on the tapis, to make him the custodian of those funds which they felt obliged to save. On a more than usually hilarious occasion one of them returned rather the worse for the wear, and knocked the treasurer down on his refusal to deliver the trust money; the other depositors, we are glad to say, gave the ungentlemanly tippler a sound thrashing. But, though Edison could be trusted with his colleagues' money, he was himself in a chronic state of penury, since he devoted every cent, regardless of future needs, to scientific books and materials for experiments. Nor was he in any great favour with his employers; they wanted operators, not inventors, so they—not unreasonably—said.

THE LOUISVILLE PRESS GIVES HIM A STATE DINNER.

At one time he was in such straits that a necessary journey from Memphis to Louisville had to be performed on foot. At the Louisville station he was offered excel-

lent chances to put his extraordinary skill to use. He had perfected a style of handwriting which would allow him to take from the wire in very legible longhand forty-seven and even fifty-four words a minute. As he was but a moderately rapid sender, he invented an automatic help which enabled him to record the matter at leisure and send it off as fast as it was needed. Of this Louisville stay, one of his biographers says:—

True to his dominant instincts, he was not long in gathering around him a laboratory, printing office and machine shop. He took press reports during his whole stay, including on one occasion the Presidential message and veto of the District of Columbia by Andrew Johnson, and this at one sitting, from 3.30 p.m. to 4.30 a.m. He then paragraphed the matter received over the wires, so that each printer had exactly three lines, thus enabling a column to be set up in two or three minutes' time. For this he was allowed all the exchanges he desired, and the Louisville press gave him a state dinner.

HIS FIRST PATENT. IT WORKED TOO WELL.

A little later Edison received his first patent—a machine for recording votes, and designed to be used in the State Legislature. It was an ingenious device, by which the votes were clearly printed and shown on a roll of paper by a small machine attached to the desk of each

I have my own ideas, and I take my stand upon them, you know. A man who does that is always charged with eccentricity, inconsistency, and that kind of thing.
Middlemarch

MR. EDISON'S HANDWRITING.

member. The invention was never used, and Mr. Edison tells with a comical twinkle in his eyes how amazed he was to hear, on presenting it to the authorities, that such an innovation was out of the question; that the better it worked the more impossible it would be, for its use would destroy the most precious right of the minority—that of filibustering. The inventor thinks, however, that he received quite the worth of his trouble in the lesson taught him to make sure of the practical need of and demand for a machine before spending his energies on it.

ASTRAY IN THE STREETS OF NEW YORK.

In this same year, Edison came to New York friendless and in debt on account of the expenses of his experiments. For several weeks he wandered about the town with actual hunger staring him in the face. It was a time of great financial excitement, and with that strange quality of opportunism which one would think had been woven into his destiny, he entered the establishment of the Law Gold Reporting Company just as their entire plant had shut down on account of an accident in the machinery that could not be located. The heads of the firm were anxious and excited to the last degree, and a crowd of the Wall Street fraternity waited about for the news which came not. The shabby stranger put his finger on the difficulty at once, and was given lucrative employment. In the rush of the metropolis a man finds

his true level without delay, especially when his talents are of so practical and brilliant a nature as were this young telegrapher's. It would be an absurdity to imagine an Edison hidden in New York. Within a short time he was presented with a cheque for \$40,000, as his share of a single invention—an improved stock printer. From this time a national reputation was assured him. He was, too, now engaged on the duplex and quadruplex systems, which were almost to inaugurate a new era in telegraphy.

WORKING TWENTY HOURS DAILY FOR FIFTEEN YEARS.

"Do you have regular hours, Mr. Edison?" I asked not long ago. "Oh," he said, "I do not work hard now. I come to the laboratory about eight o'clock every day and go home to tea at six, and then I study or work on some problem until eleven, which is my hour for bed."

"Fourteen or fifteen hours a day can scarcely be called loafing," I suggested.

"Well," he replied, "for fifteen years I have worked on an average twenty hours a day."

This astonishing brain has been known to puzzle for sixty successive hours over a refractory problem, its owner dropping quietly off into a long sleep when the job was done, to awake perfectly refreshed and ready for another siege. Mr. Dickson, a neighbour and familiar, gives an anecdote, told by Edison which well illustrates his untiring energy and phenomenal endurance. In describing his Boston experience Edison said he bought Faraday's works on electricity, commenced to read them at three o'clock in the morning, and continued until his room-mate arose, when they started on their long walk to get breakfast. That end, however, was entirely subordinated in Edison's mind to Faraday, and he suddenly remarked to his friend: "'Adams, I have got so much to do and life is so short, that I have got to hustle,' and with that I started off on a dead run for my breakfast."

MENS SANA IN CORPORE SANO.

Mr. Edison's fine gray eye is the clearest I ever looked into, and his fresh, wholesome complexion and substantial, though not by any means corpulent figure, are not better described than by the stock phrase "the picture of health." There is none of the lean and hungry look of the overworked student about him. His face, though strongly, even magnificently chiselled, is almost boyish in its smoothness, and in his manner there is that flavour of perfect simplicity and cheery good will given only to the very great. He is one of the most accessible of men, and only reluctantly allows himself to be hedged in from certain interviewers of the baser sort. "Mr. Edison is always glad to see any visitor," said a gentleman who is continually with him, "except when he is hot on the trail for something he has been working for, and then it is as much as a man's head is worth to come in on him."

The inventor describes himself as possessing only a fair amount of manual dexterity in the manipulation of machinery. Yet he generally controls with his own fingers the mechanism of his experiments. There have been associated with him during his working history two or three gentlemen who have materially aided him, where a second brain and hand are needed. These co-operative experiments have been carried on in a very pleasant atmosphere of camaraderie.

HOW MR. EDISON INVENTS.

His genius comes near to justifying that definition of the word which makes it an infinite capacity for taking

pains. "Are your discoveries often brilliant intuitions? Do they come to you while you are 'lying awake nights?'" I asked him.

"I never did anything worth doing by accident," he replied, "nor did any of my inventions come indirectly through accident, except the phonograph. No, when I have fully decided that a result is worth getting, I go ahead on it and make trial after trial until it comes."

"I have always kept," continued Mr. Edison, "strictly within the lines of commercially useful inventions. I have never had any time to put on electrical wonders, valuable simply as novelties to catch the popular fancy." And he named in distinction some noted electricians who had made their reputations through the pyrotechnics of the profession.

HE HATES A TELEPHONE.

"What makes you work?" I asked with real curiosity. "What impels you to this constant, tireless struggle?"

AT TWENTY-ONE.

You have shown that you care comparatively nothing for the money it makes, and you have no particular enthusiasm in the attending fame."

"I like it," he answered, after a moment of puzzled expression, and then he repeated his reply several times as if mine was a proposition that had not occurred to him before. "I like it. I don't know any other reason. You know some people like to collect stamps. Anything I have begun is always on my mind, and I am not easy while away from it until it is finished. And then I hate it."

"Hate it?" I asked, struck by his emphatic tones.

"Yes," he affirmed, "when it is all done and is a success, I can't bear the sight of it. I haven't used a telephone in ten years, and I would go out of my way any day to miss an incandescent light."

THE INVENTOR VERSUS THE PATENT PIRATE.

Mr. Edison waxes eloquent and righteously indignant over the treatment which the inventor is only too apt to

MR. EDISON AND HIS PHONOGRAPH.

receive. He thinks that it is flying in the face of providence to patent an important discovery; for a race of professional sharks has arisen to dispute, with absolute disregard of facts, priority of claim to valuable patents. The better known the patentee, the more liable are they to swarm about with suborned witnesses. Mr. Edison has no fault to find with the patent law in this matter, but condemns strongly the practice of the United States Circuit Court in issuing injunctions forbidding an inventor to use his discovery until the case is decided—a period often covering years. He maintains that this works great injustice to the honest parties to a suit, and that there is “no protection in patents at all.”

“However, I am glad to see that Bradstreet rates your credit at \$3,000,000 (£600,000),” I remarked.

“It did not come from my inventions,” he said quickly, “I never made money as a professional inventor. What property I own has been accumulated since I began to do business and manufacture the machines in my own shop. That is the only hope of the inventor. He will starve if he depends on his patents.”

Those who have been associated with Mr. Edison add that he has been fleeced by unscrupulous lawyers and patent sharks so unmercifully that it is to be wondered he has any faith left in mankind.

In the Orange mountains Mr. Edison has a pretty home, presided over by a charming wife—his second—and three children, of whom the eldest boy is beginning an apprenticeship in his father's work.

THE ESTIMATE OF A TWENTY YEARS' ASSOCIATE.

Perhaps no one is in a position to give a truer estimate of the inventor as he appears beyond the threshold of his laboratory than Mr. Edward H. Johnson, who was associated with him in the disillusionizing atmosphere of business for twenty years. Mr. Johnson himself is an American of a type which is a necessary complement to creative genius such as Edison's. He has shown a masterly ability to comprehend the intricate problems of organising and conducting the great companies, by whose agency inventions such as the incandescent light and the phonograph could be brought to the people all over America—a work than which affairs of state themselves call for scarcely less breadth of view, talent for combination, and executive force.

He characterises Edison as genial and even frolicsome, with a temperament which might even be called boyish. “In the whole course of our connection,” says Mr. Johnson, “and notwithstanding the many strains on his temper and the injustices which he suffered from unscrupulous business antagonists, we have had but one ‘difference.’ That was based on a pure misunderstanding and has long since died a natural death. My association with him has been of the greatest profit and pleasure to me. Our active friendship will end only with the death of one of us, though our business relations have ceased in the course of the natural ramification of the electric light and power industries,

with which I became more intimately identified than did his other laboratory associates."

HE IS A RELUCTANT LION.

Though Mr. Edison is social in his nature even to the point of jollity, he is thoroughly averse to the formulas of a conventional society. Can we expect men who work twenty hours a day to cultivate the more elaborate graces? This is in some sort to be regretted, especially from the point of view of the circles which, if he were otherwise minded, would be open to him; for he is really a brilliant conversationalist. But while society loses a lion, the world gains a genius. "He has often been heard," continued Mr. Johnson, in his courteous answers to my questions, "to express contempt for an inventor who, having produced a single invention, makes a tour of 'society' to receive its plaudits, and, finding the life so agreeable, pursues it permanently, to the destruction of his further ambition."

Mr. Johnson deprecates this hiding of Edison's delightful personality under the bushel of reserve, and wishes that he might be gently and tactfully lured into the social world, which, when once he had confidence in his command of its technicalities, he could not but greatly enjoy.

But perhaps it is well to remember that the fearful and wonderful thing we call "society" was made neither by nor for geniuses. And he is only a genius.

No, clearly the world is ready enough to grant him hero worship; but it is rather as we see him at noon

taking his workmanlike lunch basket on his knees, or as we hear of his being refused admittance to his own laboratory by a new porter, who sees nothing in him but a suspicious-looking person in a slouch hat—than as a candidate for initiation into the sartorial and other mysteries of the *beau monde*. As well as these may be in their way, they are utterly foreign to the most picturesque and lovable aspects of Edison.

THE INVENTOR AS A BUSINESS MAN.

It is told that in the halcyon days of Mr. Edison's earlier manufactories, he absolutely refused to have any system of book-keeping, and even kept no record at all of notes to be paid. When these fell due, he would drop everything and scurry around to raise the necessary funds—this on the principle, as he put it, that the notary's fee on the protested note was cheaper than keeping books! He has learned much since then in the stern *regime* of the business world; but it is still the unqualified opinion of many true friends that both the world and Mr. Edison would have been gainers if he had left the conduct of the purely business side of his affairs to associates of special commercial training and instincts. For the inventor has an intolerance of forms in business, as in society. He undertook an active part in the management of the industries he had created in consequence of his disappointment at the slow development of the electric lighting venture. Mr. Johnson gives him credit for fertility of resource and brilliancy of

PHONOGRAPH ROOM IN MR. EDISON'S LABORATORY AT ORANGE.

conception in his business management, but easily shows how little these avail in the exacting world of commerce when not backed by the patient pursuit of an established order.

This natural disregard for the forms and minutiae of business affairs has led to anything but a path of roses for Mr. Edison in his financial operations.

A SENSITIVE NATURE.

"He is frank and open to a degree," said Mr. Johnson, "and, despite many a sad experience, as well as oft-repeated expressions of cynicism under the sense of injustice, he is always ready with sympathy and an open hand. When he feels himself injured he is bitter for a time, but this passes away unless fed by the active hostility of an opponent.

"He is extremely sensitive to criticism of his motives, and is even too apt to interpret a light remark to mean a great disparagement. When he is robbed of money he will easily forget it; but if attainted in any moral sense he becomes relentless."

EDISON'S PLACE AMONG THE WORLD'S SCIENTISTS.

It might seem an infelicitous place for such a heading in the midst of a discussion of his business relations, but his achievements cannot be separated from commerce. He is an inventor, not a discoverer of underlying laws and mathematical formulas. The keynote of his work is commercial utility. He is willing to make mathematics, pure science, his servant; but, as an end in itself, he has no taste for it. He sees in every idea that ever taxed his brain a direct immediate worth to the people about him, though it may not be within the limits of human imagination to comprehend the extent of that worth. The masses of his fellows and their needs are regarded in every test, in every experiment, in the most daring new conception and in the most homely improvement alike. He asks himself when a new idea is suggested: "Will this be valuable from the industrial point of view? Will it do some important thing better than existing methods?" And then, if the answer is clearly affirmative, "Can I carry it out?" He is not so much a seeker after truth as he is a mighty engine for the application of scientific truths, through unexpected and marvellous channels, to the fight we are making "in the patient modern way." He is an inventor purely, and the greatest of his race. One might call him the Democrat of Science.

A WIZARD AT WORK.

It is a sign not to be passed over without thought, that the first chamber the visitor enters on invading Mr. Edison's workshop, at Orange, is a library with voluminous and closely packed shelves. It is the sumptuous room of the establishment, and with a further store of volumes at his home, contains one of the most costly and well-equipped scientific libraries in the world; the collection of writings on patent laws and patents, for instance, is absolutely exhaustive. It gives in a glance an idea of the breadth of thought and sympathy of this man who grew up with scarcely a common school education. Nor will one find this self-taught and self-made scientist only a gigantic specialist. He will respond to any topic of real interest and value, will talk intelligently, and quote appositely.

But while it is significant to note that Mr. Edison's sympathies have not been dwarfed by his early limitations, yet it is in the character of specialist, after all, that he enchains our attention; a more profound impression of him comes when he stands in his roomy, but topsy-turvy laboratory, with its two well-hung and well-locked doors, or when he is directing the assistants

and skilful workmen who follow his behest with something nearly akin to reverence. The inventor told me that in the huge system of electrical manufactories with which he is associated, no very large proportion of the best helpers come from the colleges, so many of which now have special courses in the new profession. The college training has the danger of spoiling them for the necessary rough manual labour. For a long time they used to apply a test here when a new man came in. He was told that one of his duties would be to sweep the floor in the morning—this, of course, only to try him. But if he bridled up and resented it as an insult, we knew that he could never be of much use as an electrician.

THE WEAPONS OF MAGIC.

Two centuries ago Edison would have had a poor chance to escape the stake if the good citizens of Salem had taken an awed peep at the uncanny materials of his stock-room. In these multitudinous drawers and shelves lurk unearthly relics of birds, beasts, plants and crawling things. The skins of snakes and fishes, the pelts of an extraordinary number of fur-bearing animals, some of them exceedingly rare, the hide and teeth of sharks and hippopotami, rhinoceros horns, the fibres of strange exotic plants, all manner of textile substances and precious stones from the uttermost parts of the earth, are there waiting to bridge over their destined gap in some important machine. Many of the great inventions have awaited a laborious trial of this infinite variety of material before they became practical. "That," said Mr. Edison, pointing to a globe enclosing the filament of the incandescent light, "never would work right, no matter how hard we tried, till the fibre of a particular kind of bamboo was put in"—the marvellously delicate, quivering elastic thread which we have all seen. The phonograph, too, was only perfected after finding the value of the hard sapphire stone for several of its parts—the reproducing ball, the recording knife, and others.

STORING UP A SYMPHONY CONCERT.

A later development of the musical phonograph is the last device which Mr. Edison has perfected; it is now on the point of being introduced to the world. The cylinders of this instrument can record the most elaborate musical instrumentation. We sat down before it with the inventor and listened for half an hour to various selections from popular composers. It is hard to believe, but the machine has been so delicately constructed that the very quality of tone in most instruments was preserved. This effect is its special value, which Mr. Edison has spent much work in attaining. One feels tempted to pinch one's self to break the dream when the violin's long drawn notes with their sympathy and pathos, the cello's marvellous tone, the firm, clear, reed sounds of the flute, and the cornet's blare, are ground out of this insignificant bundle of bolts and bars—the whole of which one might almost get into a peck measure. It is a sight to be remembered—the picture of Mr. Edison quietly listening with rapt enjoyment till the last strains of "Cavalleria Rusticana" had died away, only moving to put on a "new tune," or once in a while, with a slight touch, to try if increased pressure on some lever would improve the quality of the tone. He promises in time to have this phonograph reproducing all the harmonies of its musical record as well as the first tones.

A SINGLE INVENTION SAVES £3,000,000.

Perhaps it will give a better idea of what Mr. Edison's work means to the world than any generalisation or enume-

MR. EDISON AT WORK.

ration to simply state that the duplex and quadruplex systems of telegraphy begun by him in 1869, and finished after six years of work, have saved in America alone the enormous sum of \$15,000,000. By the duplex system two currents of different degrees of strength were sent over the wire in the same direction, thus doubling its efficiency, while the quadruplex arrangement became possible when it was discovered that these two currents could be sent in opposite directions at the same time—thus enabling one wire to transmit four simultaneous messages. Not satisfied with this, Mr. Edison is confident of attaining sextuplex and octuplex systems.

INSTRUMENTS OF MARVELLOUS DELICACY. MEASURING A MILLIONTH DEGREE FAHRENHEIT.

Through the mysterious qualities of a carbon button Mr. Edison has been able to construct a little machine called the tasimeter, which in different forms, measures degrees of heat, of moisture, and—in the odorscope and microphone—of odours and sound so small that it is difficult for the human mind to grasp the situation. The tasimeter will show a sensible deflection at the one-millionth of a degree of Fahrenheit. The heat from the human body standing eight feet away will be accurately registered; a lighted cigar held at the same distance will give a large deflection, as will the heat of a common gas jet *one hundred feet away*. When it is arranged to be sensitive to moisture, this astonishing instrument was deflected eleven degrees by a drop of water held on the finger five inches away. The microphone multiplies the intensity of sound by the hundred thousand, making the passage of the tiniest insect sound like a mighty deafening roar.

THE GREATEST TRIUMPHS ARE YET TO COME.

Electrical science is in its infancy. Those who are greatest in the march of mechanical progress confidently predict that future discoveries will be as incredible to us as the present science would be to our forbears of two centuries back. One single further secret won from nature will open a practically limitless field for electrical introduction, and will probably be more decided in its quantitative results, as the technicians say, than any invention the world has seen. It is the direct production of electricity from oxygen and coal (carbon). At present we burn coal to obtain steam, which is transmuted into mechanical energy and thence into electricity. Before the energy of the coal reaches the dynamo six-sevenths of its power are lost, even under the very best conditions, and afterwards one-tenth of the remainder. Find a way to dispense with the steam engine in this making of electricity, and we have multiplied several times the available mechanical energy of the world. Thousands of the brightest and most earnest engineers and chemists are now striving, generally in secret, to obtain this gigantic result—beside which the philosopher's stone was but a bauble. Edison has worked on it and confidently predicts that the discovery will come. He asserts that he is no longer troubling himself about it, but he has a very well-equipped chemical laboratory, in which, nowadays, he spends most of his time, and if he happens upon this secret we have no idea that he will let it pass by unnoticed.

When we shall have made this eternal saving in our fuel supply the Atlantic steamships will need only a snug little coal-bin for 250 tons of coal instead of one for 2,500 tons. There will be no more forced draughts, and grimy, consumptive stokers, and the five-day record will be an uninteresting reminiscence. The great English ship-builders can already construct a vessel to go 40 knots an

hour, if only she could burn 2000 tons of coal a day; then she will only have to burn 200. Then it will take only one-twentieth of an ounce of coal to carry a ton one mile!

Nor is it only the sanguine dream of inventors—this magnificent discovery. So cool-headed a business man as Mr. Johnson, whom I have been quoting from before, believes that we shall certainly have the problem solved early in the next century. "It will," he adds, "make short work of machinery now run by electricity. The greatest future of electricity is in its quality of a power agent. Light and heat it will give, but power is the grand field for its employment. All that is required is cheap production; the means of utilising it effectively and economically are even now more perfect than in the case of the steam-engine or the horse."

NIAGARA IN HARNESS.

While our industrious alchemists search for the Great Secret, we are doing the best in our power to make up for the inefficiency of steam by utilising the energy of streams. In the Falls of Niagara there is about three million horse-power hitherto wasted. But now a portion of this monster force is in the traces. One hundred thousand horse-power is caught by giant turbines, is transformed into electricity on the spot, and then sent over wires to distant points to give light and turn wheels. The silent, invisible power is to be taken, to the city of Buffalo, or even farther, and as a local result that town is already looking forward to a population of a million. It helps us to realise our gain on nature when we think that even this bit stolen from Niagara—only one three-hundredth of her might—is equivalent to the continuous work, night and day, of six hundred thousand men. The question at once arises, why we do not utilise all the Niagara power and run every piece of machinery in New York City with it? Perhaps some day we may; but at present there is a practical limit to the long-distance transmission of power which puts this feat out of the question. At great distances there is too much resistance to be overcome to make it commercially efficient; and the personal equation of the men who have the machinery in charge must always be taken into account," said Mr. Edison. "No machinery can be much beyond the conception of the men who run it. That is a point seldom thought of but ever present in the consideration of these new problems."

WE MAY TRAVEL 150 MILES PER HOUR.

It is now but a question of time when the mantle of the steam locomotive will fall on the electric car. The latter has made the first advances towards supplanting steam in such work as is required in the long B. and O. tunnel under the city of Baltimore, where whole trains—even freight trains with their locomotives attached—are hauled six or seven miles by powerful electric motors. The engineers studying the practical details of electrical locomotion are still uncertain as to whether we shall have a separate locomotive drawing the future train or whether each car will be equipped with its own motor.

The possible speed is to be limited only by the problems of the cohesion of steel in the rails and engines. I asked Mr. Edison what, in his opinion, was the practical speed limit on the horizon of electrical locomotion, and he answered, "perhaps 150 miles an hour." He made at Menlo Park one of the first important experiments in electrical railways, exhibiting one in 1882 that carried cars 40 miles per hour. But before we come to moving heavy trains by electricity, to which there are serious, though not insuperable, obstacles, he believes

that we shall shoot our mail through the country by some electrical device, of telpherage construction possibly.

THE SOCIAL ASPECTS OF CITY RAILWAYS.

But perhaps the most far-reaching results of the introduction of electrical transportation will be seen in our city and suburban railways. That was, after all, but a feeble bit of philosophy which said "time is money." For when the problems of our congested centres of population are considered, time is green fields and running brooks, fresh air, and cream and butter and eggs, it is life and health and happiness for the ill-fed, ill-housed, untaught class, which our social and industrial systems constrain to exist in city tenement houses. When the fathers of such families as we now see in Mulberry and Cherry streets can go every night to their country homes thirty miles away from work in half as many minutes for five cents, then we shall be well on our way to a signal solution of the ugliest questions of the day.

ELECTRICITY AS A LIFE-SAVER.

It will never be known how many lives have been saved by the introduction of electric lighting in our houses and streets in the stead of oil and gas. At first this might have seemed of dubious advantage when one heard stories of the fires which resulted from lighting wires, and of men and horses killed in trolley accidents. But since the improved methods of insulating have been applied—and it is to be expected that more and more of the dangerous wires will be carried underground—there can be no suspicion but that we have gained immensely in safety from fire. And this is of two-fold importance on trains and in ships, where fire so often leads to holocausts. Railroad accidents have been lessened in another way, primarily, of course, by telegraphic dispatches, without which we cannot imagine our great roads in use at all, and also in the later inventions by which one can telegraph from a moving train, currents being induced in the wires running parallel to the road. It seems to a layman little short of miraculous that the sender can tick on his instrument while the Chicago "flyer" in which he is travelling is making sixty miles an hour, and send a message by this wonderful property of induction over wires which may be so much as 500 feet away! In certain of the great railroad central offices there are charts in which all the trains at the moment in use are represented in miniature in the relative positions they actually occupy, the movements being electrically recorded. And when hearing by electricity comes into general use, as it certainly will, we shall be advantaged further by immunity from the deadly car stove.

In the ocean greyhounds that are again and again cutting off the distance between Europe and America, electrical devices are of signal service in reducing the danger to life. The bearing on the ship's enormous shaft is announced, when it gets to the danger point, to the engineer by a little electric bell which tinkles automatically, the bearing having closed a circuit on reaching a certain fixed point in the shaft.

The terrible danger of collision with icebergs will be lessened through an application of that same small carbon button which registered a millionth of a degree of heat. An apparatus has already been arranged to effect this—the nearing bergs announcing their presence through the increasing cold, which the tasimeter records.

A HUNDRED YEARS HENCE.

We shall almost certainly be flying. The greatest difficulty at present in the way of that pleasing performance is the weight of the motor and fuel relative to the

power necessary. The chemical production of electricity will sweep away that obstacle by making possible the construction of motors weighing but a small fraction of the lightest now constructed, and by effecting an even more decided saving in fuel.

As one result of the flying-machine, among the many which it will effect even revolutionary in character, a writer has pointed out that we shall probably be delivered from the institution of war, since such terrible destruction will be possible with a corps of fighting aeroplanes that no nation will dare to risk it.

Farming by electricity has been successfully tried in the Southern States, and it is not improbable that we shall see the agriculturist of the future sawing his wood; cutting his ensilage, shelling his corn, threshing his wheat and running his creamery with power from a small electric plant owned in co-operation with a half dozen of his neighbours.

We should be whisking our heavy baggage, too unwieldy for the aeroplanes, through the country by electricity applied to some telpherage or other system. We shall be cooking by electricity, and heating and lighting our houses, our cars, and our ships. We shall not only cook our meals; we shall probably serve them too, to judge from an experiment made not long ago in Baltimore with much more *éclat*.

SEEING, HEARING, AND THINKING BY ELECTRICITY.

But these methods fairly seem old-fashioned beside some of the feats which our most daring electricians are considering as possible. If we hear by electricity—through the telephone—why, do these undismayed men ask, can we not see at a distance by the same agency? The vibrations of light are, to be sure, many times more rapid than those of sound; but it is merely a question of obtaining a diaphragm which will respond to those vibrations. May we not look forward to seeing, from our easy arm-chair in New York, the latest drama at the Théâtre Française?

And since hearing is but a tickling of the brain by vibrations, may we not, if our apparatus for introducing these vibrations to the brain-centres gets out of order—if, in short, we are deaf—lead the impulses to the brain through the bones of the head, by electrical means?

With the problems of seeing and hearing by electricity established, there is not so wide a gap to bridge over to the idea of thought-transference by the same means. Everything they have observed leads our psychologists and physiologists to suspect that the impulses from the brain along the nerves to the muscles are, if not electric, at any rate inextricably combined with electrical phenomena. All of us know the simple experiment in our physiological lessons of making an electrical impulse act on a frog's muscles as an act of volition from the brain. If it be true that thinking is, or is always accompanied by, an electrical disturbance, why should we not be able to induce thoughts in other people's brains corresponding to our own? Mr. Edison worked on this *bizarre* problem with much earnestness. He and his assistant, Mr. Bachelor, fitted up their craniums with a coil of wire each, and connecting the two with a string, impregnated successively with various conducting substances, the thinkers thought away sturdily, testing, at intervals, the effect on each other. Many times, said Mr. Edison, their hearts were in their mouths with the belief that the connection had been established; but on laying traps for one another it was invariably found that the result was but the product of their strained imaginations.

CHARLES D. LANIER.

LEADING ARTICLES IN THE REVIEWS.

ARE WE TO LOSE COMMAND OF THE SEA?

LORD GEORGE HAMILTON contributes to the *National Review* a dispassionate and statesmanlike paper on the question, "Is Our Sea-Power to be Maintained?" In discussing this, which is a question of life and death for us as an Empire and as the traders of the world, he carefully abstains from partisan recriminations or alarmist rhetoric. He quotes Mr. Gladstone's "perfect" satisfaction at "the adequacy and capacity" of our Navy, and then proceeds to give a plain statement of the facts:—

"The purposes for which the British Navy exists" are the protection of the colonies, commerce, and territories of the British Empire, against the united naval forces of the two strongest existing foreign fleets, by maintaining against such a combination the command of the sea . . . France and Russia happened to be then, and are still, those two Powers, and therefore their fleets, present and prospective, form the test.

Since foreign nations have few distant coaling stations and their battleships have inferior coaling capacity, the great naval struggle, if it came at all, would most probably occur in European waters. Hence comparisons between ours and the allied navies must leave out of count "all our foreign squadrons abroad (except the Mediterranean) as being too remote from the central conflict, and as being mainly composed of second-class cruisers and small vessels, whose functions are not to fight battle-ships, but to protect commerce."

BEFORE AND AFTER THE NAVAL DEFENCE ACT.

Lord George then proceeds to make tabulated comparisons at three periods.

In March 1889, before the Naval Defence Act was introduced, . . . we had of effective battle-ships 32, of 262,340 tonnage, against 23 French and Russian ships of 150,653 tonnage, but . . . many of our ships were old. In April 1894, at the end of the Naval Defence Act, . . . the five years' work ending in 1894 . . . shows in battle-ships alone an addition of 14 ships, 179,300 tons to the British Fleet, against 13 ships, 120,300 tons to the fleets of France and Russia. . . . Our ships are more modern, and have relatively a greater concentration of offensive and defensive power than the ships added to the other navies.

These figures do not include "our present effective armoured and first-class cruisers," which number 29 against a Franco-Russian total of 17.

Thus, as the case of the three greatest naval Powers of Europe now stands, "although we may fairly claim to be equal in strength to our two most formidable competitors, no one can pretend that the margin of our superiority is such that we can afford to rest on our oars."

FRANCE AND RUSSIA BUILDING FIVE TIMES AS MUCH AS WE ARE.

Comparing next "the prospective building programme of the three countries on January 1st, 1894, as now known,"

France and Russia will have, on January 1st, 1894, no less than 23 large ships, with an aggregate tonnage of 210,300 tons, in various stages of construction, against only 4 of Great Britain, with an aggregate tonnage of 56,000. But at the time I am writing, on three out of the four . . . no actual work has yet begun.

Every wise Englishman will agree with Lord George Hamilton when he says, "These figures indicate an urgent danger ahead."

SINKING BELOW THE MINIMUM.

The ignorance or indifference of the public, combined with the delays consequent on change of Administration and the Coal War, make our naval peril still more serious. In 1892 the late Board of Admiralty had decided on beginning five new ironclads during the two years 1893-94, declaring, however, that this was "the minimum requisite to meet only the future wastage and depreciation of the existing fleet." But though France and Russia were going in for a large increase of construction, yet the present Government has not kept up this minimum requisite, but instead of the five has only gone on with two.

Lord Spencer's public speeches and exchange of opinion with naval officers leave nothing to be desired; but for more than a year nothing has been done to counteract the prospective development of other navies. . . . It is clear that the obstruction is not within that Department, but outside.

Lord George gives the Government credit for adding to our torpedo gunboats, but strongly objects to this expenditure being met by reducing the annual normal outlay on large ships.

"AT THE ELEVENTH HOUR."

The loss of time has been great.

Every month saved now is of incalculable value as regards our future naval supremacy. It is from this standpoint, and not from any factious or partisan motive, that I and my friends in the House of Commons are urging the Government to announce at once their intentions, and receive the preliminary sanction of Parliament, so that the contract work may at once be placed. By this course at least three months can be saved; unless it is adopted, no new expenditure can be incurred until after the approval of the votes presented in March next; and the time subsequently occupied in inviting tenders and preparing specifications would further delay the commencement of heavy work till May or June 1894; and saving of time is now a consideration as important as the expenditure of money. . . . We are arriving at the eleventh hour; and unless a prompt, vigorous, and sustained action be at once taken, "Too late" may be the epitaph of our next great scheme of naval outlay.

The last few years have wrought a great change of feeling upon the subject of naval expenditure. A Government which starves the Navy loses popularity; the Government that adequately maintains it gains popularity.

All that is soundest in English life will support Lord George Hamilton's concluding appeal to the Government to "face resolutely and deal adequately with the grave national danger."

THE LAW OF SEA POWER.

THE agitation for a strengthened navy naturally finds reflection in the magazines. "Nauticus," who writes from the point of view of "a naval expert of neutral nationality," and of "a publicist who finds in the *Independence Belge* a tribune," expounds in the *Fortnightly* the laws of "Sea-Power; its Past and Future." He calls attention to the great discovery published three years ago, by Capt. Mahan, of the United States Navy. This was a discovery of the simple fact that sea-power, whether local or universal, cannot be enjoyed by more than one tenant in any given district, and of the law that "sea-power, or mastery of any sea, in proportion as it is complete, confers upon its possessor an ultimately dominating position with regard to all the countries the coasts of which border that sea." This law is verified in the

great wars of history in which navies took part. Capt. Mahan's demonstration of it has "roused the dockyards of Europe and America to unwonted activity."

GERMANY NOT FRANCE OUR RIVAL.

Many maritime powers forget, however, that sea-power does not rest primarily upon the possession of a strong navy, but upon the possession and the maintenance of a superior maritime trade. A navy does not make trade. . . . Spain had at one time the best trade of the two hemispheres. When she lost her naval supremacy she also lost her trade. The Netherlands inherited Spain's business, but preserved it only so long as the Netherlands navy was equal to the task of its guardianship. . . .

If, to imagine an illustration, a naval war were to break out between France and Great Britain, and if the latter were to experience a decisive and crushing defeat at sea, she would lose her trade. But, in the existing circumstances, it would certainly not pass under the control of France. There is no doubt whatever that Germany, which is already the second commercial power, would immediately become the first. . . .

Unfortunately France remains "blind to the fact that the vacated place would be occupied by Germany. She persists in believing that she could take it. And this is because she will not accept Captain Mahan's law of sea-power."

WHAT EUROPE HAS A RIGHT TO DEMAND.

Great Britain pretends to the supremacy of the sea, and Europe is, upon the whole, resigned to her enjoyment of it. But . . . Europe has a right to demand that so long as Great Britain continues to put forward her claims, she shall support them so determinedly and with such a convincing display of her ability to maintain them as to accustom her envious neighbours to the idea that in a quarrel with her they are doomed to defeat. Upon no other terms is her presence in the Mediterranean either tolerable or defensible. . . . Her sea-power has ceased to be convincing, undoubted, recognised; to-morrow it could be shattered, perhaps immediately, by France alone, if only France had no other preoccupations and if she were assured beforehand of Italy's non-interference. For the citadel of British sea-power, the vantage-point upon which rests the centre of the British position in Europe is in the Mediterranean; and, excluded from the Mediterranean, the United Kingdom would in a few years be no weightier a factor in international politics than the Netherlands or Denmark.

"Nauticus" shows by comparative tables British naval inferiority to France in the Mediterranean, and concludes that our "present policy of pretension and powerlessness in the Mediterranean is perhaps the most formidable of existing menaces to the peace of the world."

MR. LILLY'S BLAST AGAINST DEMOCRACY.

It is quite in the academic style that Mr. W. S. Lilly proceeds to enlighten the readers of the *Fortnightly* on the nature and method of true self-government. He is moved with a lofty pity at the vulgar notion that self-government is realised by current democratic institutions. He draws—chiefly from Mr. Bryce's writings—a picture of the partisanship corruption and "boss" rule which prevail in the United States, and exclaims, This is what you call self-government "in its greatest perfection!" He then turns to Great Britain, and says, "Our governors," too, are "merely the chiefs of a dominant party."

Self-government in England, as in America, means party government; and in England, as in America, the two great parties represent little more than a desire for power and place. . . . The fact is certain that to win or retain office, not to carry out principles, has become the dominating motive of the two chief political parties. . . . True, the system of Ring-and-Bossdom is at present inchoate among us. But surely the Parliamentary party, of which Mr. Bryce is an ornament, is

essentially a Ring, and, most assuredly, the Prime Minister is a Boss *in excelsis*! And he rules his followers with an absolute sway which an American Boss might envy. . . . In England, then, as in the United States, "self-government" really means bossdom in fear of the Irish vote.

Mr. Lilly knows no more signal proof of the deep degradation of our public life, than the way Mr. Gladstone thrust Home Rule on his reluctant adherents. He next looks to France, but finds there the same story repeated.

Self-government in France, as in the United States, is party government; nor does the machinery of politics in France differ substantially from the American, although it is less highly organised. . . . These parliamentary engineers are the bosses of France, who set up one phantasmal ministry after another, filling meanwhile their own pockets.

From these counterfeits of national self-government, Mr. Lilly passes on to consider what the true article is.

Self-government in an individual man means the supremacy of the rational nature over the emotional; the predominance of the moral over the animal self. The lower powers and faculties of a self-governed man are brought into subjection, and kept in subordination to the higher.

So is it in the nation. But—and here we come on a piece of Toryism as old as Plato—"in the social organism the masses (as the phrase is) represent passion, impulse, emotion." And they must be ruled by reason. "Civil society arises from the nature of things." The State must be based on morality, on justice therefore. Justice requires that every man "should count in the social organism for his true political value. And the political value of men differs greatly."

All the elements of national life should be represented in just proportion. All should be subsumed in the reason of the organic whole. . . . "pure democracy," as it is called, the unchecked domination of numbers, is not a form of government at all. Every State is naturally an aristocracy. . . . The method, now widely supposed to be the final achievement of political wisdom, of determining great public issues by simply counting heads, is supremely irrational. You might just as well determine them by measuring stomachs.

For the present deplorable state of things Mr. Lilly has two remedies to offer: "the increased separation of the executive from the legislative Government;" and "a strong second chamber" as a "safeguard against the tyranny of a debased popular chamber."

The House of Lords, even as at present constituted, is far more truly representative of that which makes the nation what it is, of its wisdom, its experience, its culture, its independence, its great historical traditions, its imperial instincts, than the House of Commons.

So Mr. Lilly's academic disquisitions on the nature of government end in a plea for the Reform of the House of Lords. Contemporary science has established "the importance of the principle of heredity." But let the English hereditary peers be represented by only one-tenth of their number, elected every seven years. Let the "black sheep" be struck off. Let the tenure of certain great positions entitle to a seat in the Lords—such as the position of the Prince of Wales, Lord-Lieutenants of Counties, Field-Marshal, Admiral, Ambassador, Colonial Governor, etc. Seats should also be given to, say, commoners distinguished for public service, literature, science, art, to the properly accredited representative of every County Council, and to the chief magistrate of the seventeen chief cities of the United Kingdom. But no peer should be eligible for the lower House.

Such a House of Lords would be the most powerful senate in the world. It would realise self-government.

"THE LUTHER OF THE SOCIAL REFORMATION."

TOM MANN AND THE CHURCH.

Few events have made a greater sensation both in Labour and in Church circles than the announcement of the *Times* that Mr. Tom Mann was going to take orders as an Anglican clergyman. The stir was not lessened when Mr. Mann, though not decided, owned to be seriously meditating the step. Among the many articles which the subject has evoked, one of the most interesting is supplied to the *Review of the Churches* by Rev. John C. Carlile, who is an intimate friend of the Labour leader. He thus describes

MR. MANN'S "THEOLOGICAL PILGRIMAGE."

Born at Foleshill, in Warwickshire, April 15th, 1856, he was trained among Church people. In 1870 his family moved to Birmingham. There he came under the influence of Thomas Laundry, a godly Quaker, who conducted Cross Street Bible-class. Here Tom Mann found a spiritual home. In the

MR. TOM MANN.

discussions he took a prominent part, and received impressions which have moulded all his future. When he left Birmingham for London, he became a teacher in the Sunday-school at St. Stephen's Church, Westminster. Then began his theological pilgrimage, which is not yet at an end. From the Church of England he drifted to Mr. Voysey's congregation without finding mental rest. From the idealists he turned to the Swedenborgians, becoming connected with the church at Argyle Square, under the ministry of the Rev. John Presland.

MAINLY STILL A SWEDENBORGIAN.

He joined the theological class, and read deeply the works of the Swedish seer, taking also a course of reading in *Spencer's First Principles* and *Ruskin*. Up to the present

his theological position is mainly that of the New Church. Still working at his trade as an engineer, he continued to devote time to Christian enterprise and study. . . . In 1884 he lectured on "Progress and Poverty." From that lecture may be dated his crusade against the social system—or want of system—of our time. . . . Two years ago . . . he and I were discussing vital questions of religion. His attitude towards the Churches was still that of an opponent, but his love for the Divine Christ was clearly expressed. He saw plainly that the Labour movement must ultimately fail unless it has a firmer foundation than that of a desire for increased wages. The social reconstruction for which he was working could only be based upon religious and economic principles.

THE LARGER PARISH AND THE WIDER PULPIT.

Mr. Carlile, like most of Mr. Mann's friends, strongly opposes the idea of his entering the Church.

To-day thousands of men are looking with expectant hope to Mr. Mann. He, above most others, is marked out as the Luther of the Social Reformation. . . . In the Church of England he might do much, but outside he could do more. If he wants a parish, all England may be his parish; if he wants a pulpit, there is the House of Commons. . . . His religious influence is a thousand times greater now than if he turned parson.

A JUSTIFICATION OF INTEREST.

THE question, Is it right to take interest?—once so laboriously discussed by mediæval casuists—is rising again to exercise the consciences of men. In the *Annals of the American Academy of Political and Social Science*, Mr. Arthur T. Hadley writes with the aim of showing that the justification of interest, as an institution, is not to be sought either in the productivity of capital, or in the difference of value between present and future goods; but in the fact that it furnishes a means of natural selection of employers whereby the productive forces of the community are better utilised than by any other method hitherto devised.

He traces three stages in the development of modern industrial law:—

The first, where a man was allowed property as a stimulus to labour and save; the second, where he was allowed profits as a stimulus to exercise skill and foresight in management; and the third, historically almost coincident with the second, where he was allowed to offer interest to induce others to give him the means of exercising his skill and foresight over the widest range.

This is his summing up:—

If these views be correct, interest is essentially a price paid by one group of capitalists to another, for the control of industry on a large scale. The system is justified by its effect in the natural selection of employers and methods rather than by any contribution made by the individual receiver of interest to the good of society. The rate of interest does not depend so directly as has been supposed on a general market for capital, but is the result of commutation of profits in particular lines; the terms of this commutation depending upon the relative numbers of those who desire control and those who are willing to part with such control for the sake of avoiding the risks which it entails.

PRIZE CALENDAR FOR OCTOBER.

The Prize is won this month by—

1. Miss Jessie Hay, 33, Abbey Street, Elgin, Scotland.
2. W. Culling Gaze, Fengate, Peterborough.
3. W. Richards, Ardbeg Villa, Oban, Scotland.
4. C. D. Rosling, Horwell Endowed School, St. Stephen-by-Launceston, Cornwall.
5. "Veritas," 3, Avoca Terrace, Blackrock, Dublin.
6. J. S. Keeling, Willington, Burton-on-Trent.
7. George Wright, Ings Road, Burton-on-Humber.

THE PROBLEM OF THE UNEMPLOYED.

I.—A MEMBER OF PARLIAMENT'S SOLUTION.

THIS ever-recurring question is treated by Canon Barnett in the *Fortnightly*, and by Mr. J. A. Murray Macdonald, M.P., in the *New Review*. Mr. Macdonald begins by pointing to the effect which machinery has had in increasing the number and relatively decreasing the employment of the population. He contends—

1. That the proportion of the population of the country that finds work in the staple industries is decreasing, while the wealth produced in them is increasing. 2. That the increase in the population does not obtain work under satisfactory conditions in other channels of labour. 3. That the over-supply of labour cannot justly be traced to any fault of the labourer, but to a cause, operating in our industrial system as a whole, over which the labourer has hardly any control.

PUBLISHED ACCOUNTS AND COLLECTIVE CONTROL.

The remedy he advocates is "the substitution of such an organisation of industry as would lead to a due balance between distribution and production, in place of the present wasteful over-production."

To this end we first require knowledge of the actual demand and actual supply of a given commodity.

Export and import returns are not enough. "What is needed is a detailed account of the business of each particular firm in each particular industry of the country, and the collection and analysis of these accounts." In order to obtain a balance between the demand and supply of commodities thus ascertained, Mr. Macdonald advocates "the collective control of the production of any particular commodity by the whole body of the producers of that commodity"; for example, "the collective control of the whole cotton industry of the country by the whole body of those actually engaged in it," or the combination of the Miners' Federation and the Federated Mine-owners. Such an amalgamation would make the miner's connection with the mine as stable as is the mine-owner's. His third specific is the eight-hour day for certain trades.

II.—THE WHITECHAPEL CANON'S VIEW.

Canon Barnett divides the unemployed into two classes, those unable to work and those unwilling to work, requiring respectively relief and discipline. "The danger at hand is," he thinks, "not so much one of abnormal distress as of antagonism." He does not find a solution in shorter hours or new public works, or the holding over to the slack times of winter of all work that can be so arranged, or farm colonies; he condemns outdoor relief to the physically unfit, and "shelters and feeding." He approves of the proposal—

(1) That training be offered by Boards of Guardians to all willing to submit for a certain time to certain regulations; (2) that the parochial authorities reserve its street work—sweeping, cleaning, &c.—for inhabitants in its own district who have occupied tenements for at least twelve months, and that such work be strictly supervised so as to ensure the performance of a full day's task; (3) that those who refuse training and fail at street work be offered the workhouse.

The Whitechapel guardians are proposing as an experiment to offer willing, able-bodied men—inhabitants of Whitechapel—work on farms in Essex.

"DO ONE GOOD THING."

The Canon's final advice is to trust less to machinery and more to personal friendship:—

The one thing which every one can do and be certain of its use is to make friends with one or two who are in need—to do all necessary for this one or two, and leave off attempting to raise the masses. There would be perhaps more self-denial in the self-restraint than in the sacrifice. It is often less hard for many in these days of bold advertisement to spend them-

selves on platforms and at street corners, to stand night after night in close rooms feeding hungry hundreds, than to restrain themselves in order to do one good thing. If to-morrow, every one who cares for the poor would become the friend of one poor person—forsaking all others—there would next week be no insoluble problem of the unemployed, and London would be within measurable distance of becoming a city of happy homes.

HOW OUR ANCESTORS SPENT THEIR HOLIDAYS.

AN instructive and amusing article is that in the *Nouvelle Revue* on the medicinal baths of the Middle Ages, by M. Fernand Engerand. Towns may come and towns may go, as war and commerce decide; but wherever curative springs, hot or cold, start unbidden from the earth, we usually find them frequented, from age to age, by an unending stream of visitors.

The Romans have left traces of their thermal establishments all over France. The great arch in the marketplace of Aix-les-Bains, and the remains of conduits and baths underneath the flowery gardens of a neighbouring villa, testify to the long record of the Savoyard valley; and the early Gauls adopted the habits of the Roman imperial colonists, and bathed and feasted in like manner. But when Attila came down with his Huns they wrecked the complicated bathing arrangements, and that generation bathed no more. On the withdrawal of the barbarians into Germany, the natives, however, set to work to restore the conduits, and in 484 we find Prince Ambron, son of Clodion the Hairy, bathing at Plombières and at Luxeuil, where arose a legend of the seventh century, telling how St. Agile restored a dead man drowned in the bath. Aix in Provence was sought by invalids during three centuries, but Charlemagne preferred Aix-la-Chapelle, and fixed there the abode of his later years for the express purpose of enjoying the hot springs; he liked bathing in company, and his courtiers disported with him in the water.

Then came the turn of Caunterets in the Pyrenees, and of Spa on the skirt of the Ardennes. We hardly realise that Spa was a popular watering place in the time of William the Conqueror, and that invalids camped out in tents because the little old town was too small to hold them. In the fourteenth century we find an ironmaster buying wood from the Bishop of Liège and building "Young Spa," near the spring called the Pouhon.

But the strangest story of mediæval baths is that told by Pogge, the Florentine Secretary at the Council of Constance in 1415. Not far from Zurich are sulphur springs still enjoying a mild reputation among the serious and decorous Swiss people. They had been discovered, named, and used by the Romans, and may now be found in the then Gazetteer, under the head of Bade, near Aarnau. They were not of much importance in classic times and are not of much importance now, but in 1415 they were the height of fashion! From a radius of two hundred miles and farther, if the trouble and perils of the journey could be surmounted, came the bathers, not generally speaking on account of illness, but because they desired a complete holiday; and according to a long letter written by the Florentine to a friend they seem to have had a merry time indeed. Neither Bath in the last century, nor Nice, Vichy, or Royat in the present day, can boast of such carnivalesque diversions. The bathers lunched in the water off floating trays made of cork; their hair was garlanded with flowers, tied up with ribbons. Men, women, and children played games, and indulged in the wildest gaiety. Pogge, the Florentine, seems to have enjoyed it all very much, but we may well be thankful that times are quieter now.

MR. BALFOUR AS CRITIC OF IDEALISM.

MR. A. J. BALFOUR contributes "a criticism of current idealistic theories" to the current number of *Mind*. He describes the exponents of Transcendental Idealism as "a metaphysical school, few indeed in numbers, but none the less important in matters speculative." Its central position is that of—

a mind (thinking subject) which is the source of relations (categories), and a world which is constituted by relations . . . a mind which is conscious of itself, and a world of which that mind may without metaphor be described as the creator.

It claims thus to free us from scepticism, to make Reason the essence, cause, origin and goal of the world, and to secure the moral freedom of self-conscious agents.

Mr. Balfour is sorry to object to so promising a theory.

We may grant without difficulty that the contrasted theory which proposes to reduce the universe to an unrelated chaos of impressions or sensations is quite untenable. But must we not also grant that in all experience there is a refractory element which, though it cannot be presented in isolation, nevertheless refuses wholly to merge its being in a network of relations, necessary as these may be to give it "significance for us as thinking beings"? If so, whence does this irreducible element arise?

To Mr. Balfour it "certainly appears" that transcendental idealists are not warranted by their own essential principles in making mind the sole creator of experience. Their analysis of experience leads them to conclude

that the world of objects exists and has a meaning only for the self-conscious "I" (subject) and that the self-conscious "I" only knows itself in contrast and in opposition to the world of objects. Each is necessary to the other; in the absence of the other neither has any significance. How then can we venture to say of one that the other is its product? And if we say it of either, must we not in consistency insist on saying it of both?

The universe is as much or as little the creator of the self-conscious principle as the self-conscious principle is of the universe.

All, therefore, that the transcendental argument requires or even allows us to accept, is a "manifold" of relations and a bare self-conscious principle of unity, by which that manifold becomes inter-connected in the field of a single experience.

Mr. Balfour then proceeds to view the bearing of this result on theology, ethics, and science. The combining principle which, apart from the multiplicity it combines, is only an empty abstraction, and which is only real in its relation to that multiplicity, cannot be God, who by hypothesis distinguishes Himself from Nature. Just as little can the combining principle, taken together with the multiplicity, be other than non-moral, because it holds in its all-inclusive universality every element, good and bad, of the knowable world. The "unifying principle can as such have no qualities, moral or otherwise." Lovingness and equity belong to the realm of empirical psychology, and Mr. Balfour does not see "how they are to be hitched on to the pure spiritual subject."

The freedom ascribed by idealists to the self-conscious "I" is metaphysical, not moral; for it belongs only to the subject "in virtue of its being not an agent in a world of concrete fact." Mr. Balfour comments on the difficulty which exists on the Idealistic theory in bringing together into any sort of intelligible association the "I" as supreme principle of unity, and the "I" of empirical Psychology, which has desires and fears, pleasures and pains, faculties and sensibilities; which *was not* a little time since, and which a little time hence will be no more. The "I" as principle of unity is outside time: it can have therefore no history. The "I" of experience, which learns and forgets,

which suffers and which enjoys, unquestionably has a history. What is the relation between the two?

It will not do to make the latter a phase or mode of the former which is then identified with God or an Eternal Consciousness: for, argues Mr. Balfour, the idealistic theory pressed to its furthest conclusions, precludes us "from supposing that either the eternal consciousness or any other consciousness exists save only our own."

Similarly with regard to science, Mr. Balfour endeavours to make out that "the Transcendental 'solipsism' which is the natural outcome of such speculations" is no more valid or re-assuring than "the psychological, or Berkeleyan form of the same creed." He concludes:—

I am unable to find in Idealism any escape from the difficulties which, in the region of Theology, Ethics, and Science, empiricism leaves upon our hands.

CAN WHITE MEN PEOPLE AFRICA?

DR. CARL PETERS' VIEW.

AT a time when a fresh tract of Africa has been, alas! only too literally "painted red" by British troops, the value of the continent as a peopling-ground for our race is a question of no small moment. It is opportunely discussed by Dr. Carl Peters in the October *Forum*. "Prospects of Africa's Settlement by Whites" are set down by him as somewhat various. He grants that "the limit of habitability"

is advancing continually. Parts of the Dark Continent that fifty years ago, would have been looked on as utterly unfit for permanent occupation by civilised human beings have been conquered to their uses by hardy and energetic settlers. It is shown on all sides that the conditions of health are improving everywhere.

The most mountainous countries, such as the Kilimandsharo, Kikuyu, Uganda, Usambara, Karagwe, the upper Congo, and the mountainous districts around the Nyassa, will provide excellent fields for white settlement, for they possess all the necessary conditions—healthy air, plenty of water, and fertile soil. But they are like oases in the steppes, and must first be connected with the coast by railways before we may dare to take settlers to them. . . . I do not think that the whole German East-African sphere of interest, although it covers more than four hundred thousand English square miles, would ever be able to support more than a few hundred thousand European colonists. Yet this is one of the most preferable territories.

In the course of future developments, several millions of white men may perhaps settle in the more highly-favoured parts of this interesting continent; but the great bulk of it will belong perpetually to the black race, as it has belonged to that race for many thousands of years.

"THE BRAIN OF THE DARK CONTINENT."

The Africans are mostly agriculturists and cattle-raisers, and by correct and earnest treatment, they could be made to learn the duties of European labourers. . . . I am convinced that the largest portion of the farming population will, necessarily, learn to work and to respond to the advanced culture. Then they will encounter the same fate as their brothers the Zulus in the South African countries, among whom we observe, under European organisation, not only a steady increase of population but also a growing wealth.

The magic process which will open the Dark Continent to civilisation is the organisation of native labour by white intelligence. . . . I do think that, in times not far remote, Africa will be honeycombed, at all points and places fit for them, with European settlements. I believe that these outposts of the white world will in future constitute the brain of the Dark Continent.

MATABELE MANNERS.

TEN years' residence "Among the Matabeles" enables the Rev. D. Carnegie, of Hope Fountain, a London Missionary Society station in their land, to furnish to the *Sunday at Home* a very interesting series of papers on their customs and beliefs. On Lobengula and his government, Mr. Carnegie thus pronounces:—

He is their god who rules by fear, overrides justice, kills the innocent, plunders his peaceful neighbours' cattle; is, in fact, as far as it suits his cunning heathen craftiness, the same sort of a monster as his father was. Round this heathen monarch and his counsellors cling tenaciously superstition, witchcraft, and caste, which are other names for what we term the government of the country, which really is no government worthy of the name, but a patched-up combination of heathen laws and customs, of self-conceitedness, pride, and arrogance and ignorance, upheld by fear and terror, guarded by jealousy and revenge, and the frequent sacrifice of human life.

LOBENGULA'S TITLES.

Thus far the missionary. The Matabele lavish on Lo Ben among other laudatory titles these:—

The Heavens, The Spearer of the Heavens, Rain-maker; Great Father, Great Mother, Great King, Great Black King, King of Kings, King of Heaven and Earth. . . . At the dance, they often call him by the titles of Rain, The Full River, Mighty Gushing Sounding Water, The God of Rain, Rain-maker, and other such high-flowing phrases. . . . Many think that by some strange process or other the sun dies every evening, and a new one is born every morning. This opinion is more general in regard to the moon. They believe that the chief creates the new moon every month, and on their first seeing it they thank the king,

The war-dance alluded to takes place every year in January and February:—

This is held at Bulawayo, where people from every town in the land congregate, dressed up in all their finery, which includes black and spotted calico, pink and black beads, twisted round their legs, necks, and arms; skins—monkey, tiger-cat, jennette, buck, sheep; old coats, shirts, hats, and patches of rags of every description. It is the annual gala fair to which they come to thank and praise the chief for sending the rain.

"NO WORK, NO FOOD."

With all their savagery the Matabele are civilised enough to impose the labour test on every rank:—

Lazy persons who will not help in sowing or reaping are driven from town to town. No work no food is the motto for them. The queens themselves dig their gardens, and everybody who can must help to prepare for the dry season.

Unfortunately, industry does not destroy mendicity:—

From the queens and head indunas, down to the meanest slave, men and women, and boys and girls, all of them are persistent beggars. . . . Their reason for having this begging propensity so largely developed is "Because," they say, "we white people were created in the long ago—long before them, which accounts for us having so many good things and they so few."

A RICH LAND.

Mr. Carnegie speaks highly of the resources of the land:—

The soil is very well suited for all kinds of European seeds. You may have two crops a year, and good ones too, provided you attend to your land as you ought to do. You need never be without green vegetables all the year round; fruit trees grow luxuriantly, grapes and oranges and bananas flourish abundantly. The land is rich with deep soil, the valleys are

well watered, and fountains bubble up everywhere. Irrigation can be made easy; hundreds and thousands of cattle, sheep, and bucks graze here, and many more would but for the primitive mode of rearing live stock. . . . No doubt coffee, tea, and cocoa would also grow if they were planted; and the settler may reckon on fir, spruce, larch, and other kinds of trees thriving as well.

THE KING'S PALACE.

In a similar article in the *Leisure Hour*, Mr. Carnegie gives this picture of the royal residence:—

There is a dwelling-house of red brick at Bulawayo, with three apartments in it, in which are kept tobacco, mats, skins, picks, corn, beer calabashes, and various other articles. One or two pictures grace the walls, the plaster of which, when I was last there, had partly fallen off, and which can scarcely be discerned on account of dust and cobwebs. Her Majesty the Queen's picture is there amongst others. Bats and bats, not to mention other live creatures, ants, beetles, and such like, abound in every part of the house. The original fireplace is discarded, and another one, in the form of an old broken clay pot placed in the middle of the floor, is used instead.

Outside in the verandah are tusks of ivory, rhinoceros' heads, lions' skins, tigers' skins, a box or two, an old chair, and some native-made baskets. Just alongside is another brick building in which are stored clothing, calicoes, beads, shawls, guns, powder, and other lumber. A brick waggon-house, recently built in place of an old pole one, is on the "suez-up" side of the large building, while at the back, and partly round this inner yard are the huts of the queens and their slaves. Just hard by the waggon-house is the cattle kraal; and beyond it the large open enclosure some thousand yards in diameter, round which are built the huts of the town of Bulawayo.

'A EULOGY ON KHAMA.

MR. GEORGE COUSINS, of the London Missionary Society, supplies the *Leisure Hour* with a glowing eulogy on "Khama, the Bechwana Christian Chief." He recounts how Khama as a youth came under missionary influences, and how his refusal, "on account of the Word of God," to take a second wife enraged his father. Khama suffered much under the reign of his heathen father and uncle. It was only in self-defence that Khama revolted, drove out his uncle, and became king in 1872. On his accession he refused to perform the customary royal rites. He "emphatically announced his own adherence to the Word of God":—

He would not prohibit heathen ceremonies, but they must not be performed in his "khotla," and as their chief he would contribute nothing towards them. He was about, by public prayer to Almighty God, to ask a blessing upon their seed-sowing, and afterwards would set to work. Whoever wished to have his seed charmed could do so at his own expense. . . .

For twenty-one years Khama has been in power, and his reign throughout has been in thorough harmony with that early declaration. All who know him bear testimony to his consistent life, his sagacious and enlightened rule, and to the general strength, probity, and nobility of his character.

Mr. Cousins thus sums up our ally:—

Undoubtedly this chief stands out conspicuously among South African princes as the finest, noblest of them all. He rules with a firm hand, is soldierly in bearing, a keen sportsman, a good rider, every inch a man; but combined with this strength there is remarkable patience, gentleness, and kindness of disposition, and none who know him doubt his sincerity or earnestness as a Christian. The remarkable way in which by the force of his own example and conduct he has led his people forward in the pathway of enlightened Christian progress furnishes striking evidence of this.

THE POPE AND THE NEW ERA.

FROM AN ITALIAN STANDPOINT.

MANY of the views concerning the future of the Catholic Church which were ventilated in "The Pope and the New Era," published as the result of my visit to Rome over three years ago, find a re-echo—with friendly acknowledgment—in an article contributed under the same title to the *Nuova Antologia* (November 15th) by Signor Bonghi. Although the question of the Papacy is one with which the welfare, and indeed the very existence, of his country is intimately bound up, the Italian statesman approaches it with admirable impartiality and detachment of spirit. He recognises both the vast successes and the failures of the Catholic Church. He deplors the present deadlock between Church and State in Italy, and looks for a solution of the apparently insoluble dilemma mainly to the sagacity and marvellous power of adaptability of the Roman pontiffs. Meanwhile he prophesies the transference of Catholic supremacy from the Latin to the Anglo-Saxon races, gazes with admiration at the rapid strides with which the Catholic Church advances in the United States, and groans in spirit at the vast gulf which separates the utterances of American and Italian ecclesiastics. At the very outset of the article Signor Bonghi dissociates himself from those who blindly decry the Church. "A single righteous man," he writes, "was sufficient, according to the Biblical legend, to save a city. Now, the Catholic Church possesses at the present moment many more righteous men than any of the social or religious bodies which oppose her. How, therefore, should she perish?"

AMERICAN CATHOLICISM.

Then, after quoting freely from some pastoral utterances of that most energetic of prelates, Archbishop Ireland, words inspired by the broadest of democratic sympathies, he continues—

Everything that in Europe saddens and alarms the Catholic Church, in America causes her to rejoice. She feels herself young in a young society. She advances serenely towards a future in which she has faith, that same future which in Europe she regards with suspicion because it is different from the past. . . . Such a Church forms a living and powerful and pacific element in a vigorous civil society—not a dead residuum of an enfeebled ecclesiastical state. Her co-operation in all moral and social aims is not offered with greater eagerness than is displayed by those who accept her help. The co-operation of the Church in Italy is offered but seldom, and, as a rule, it is unjustly rejected. . . . Undoubtedly it is a new spirit which breathes through American Catholicism and through the clergy that direct it. Yet it is a spirit entirely Catholic, and which displays no inclination whatever to separate itself from the fount of all Catholicism, the Roman See. And this latter, than which no Government is more humanly sagacious, able and prudent, so that divine inspiration might very well fail her without any danger of her falling easily into error, directs this clergy, which differs in so many particulars from that to which she is accustomed, with a gentle and indulgent hand, that nevertheless does not fail to display firmness wherever it might appear that any fundamental principle of Catholic theory or practice is in jeopardy. And from this standpoint nothing could be more curious and noteworthy than the history of American Catholicism during the first century of its existence. It may be compared to a boy full of intelligence and vivacity who voluntarily submits to the guidance of an old man, advanced both in age and learning, who pauses at every step to weigh all possible dangers.

FROM LATIN TO ANGLO SAXON SOIL.

But the old man is of the Latin race, whilst the boy comes of mixed parentage, with a preponderance of Anglo-Saxon blood, and speaks the English language. And it is the Anglo-Saxon race which threatens to submerge all

other nationalities, and which is more truly Christian in its convictions than the Latin races are ever likely to be again. As regards the hostility between Catholicism and Protestantism, Signor Bonghi points out that the ancient bigotry of the latter towards the former is decreasing in intensity, and that whereas Protestantism is everywhere crumbling away before the attacks of rationalism, Catholicism alone stands firm, as on a rock. Hence he believes the victory of the future to lie with the Catholic Church.

That the Papacy will be transferred in the near future from Latin to Anglo-Saxon soil, our Italian author regards as a certainty. It will, he admits, be a loss to Italy, but if Italian unity can only be bought at that price, he considers that the nation ought not to hesitate. Of the personality of Leo XIII., the "sagacious statesman," he has nothing but good to say. "Not for many centuries has the Papacy attempted to exercise so intellectual and so broadly moral an authority as it has been able to exercise under the present Head of the Church. . . . Most assuredly the Papacy has not lost. The Pope enjoys greater respect throughout the civilised world to-day than had fallen to the lot of his predecessors for many years." And although his new policy has only been developed on certain well-defined lines, there is no reason why his successor, inspired by his noble example, should not develop it in yet other directions, thus bringing about that New Era, which it were infinitely worth while to see inaugurated amongst us.

A GLOOMY OUTLOOK FOR ITALY.

PROFESSOR PASQUALE VILLARI, ex-Minister of Public Instruction, and perhaps the best known to English readers of contemporary Italian literature, contributes a most gloomy article on the prospects of Italy under the title of "Whither are we Tending?" an article all the more noteworthy that the writer is an ardent supporter of the House of Savoy. This is the first time, he says, that we are compelled to doubt not only of ourselves, but of our future. Our whole moral existence is at stake. Then, after summarising the various well-known ills—political, social, financial, religious—under the accumulated burden of which Italy is suffering, the Professor continues:—

For some time now we have heard repeated on all sides that the moral level of our Parliament is growing lower day by day. . . . How is it that, whereas despotism produced heroes, liberty so far has only produced political plotters? And the worst of it is, our moral decadence having once begun it continues steadily without there being any prospect of a change. . . . The truth is, the more we examine into our present condition the more hopeless it appears to be, from every side. And we might seek through the whole universe without finding any solution of this difficult problem, because in reality the solution can only be found within ourselves. The destiny of a free people must be in their own hands. . . . Italy was made by unity, self-sacrifice, and virtue. By these means alone can she be saved.

Of help from the Catholic Church Signor Villari sees no prospect.

We can imagine in Italy a strong clerical party which would not be national but international in its interests. We can also imagine an anti-clerical party, of which the democratic liberalism would consist in fighting the Church and the Faith. What for the moment we cannot hope for is a movement at once religious, national, liberal, and progressive. The Church is in continual conflict with the State, and therefore can render no efficacious help, either social or political. And the consequences of this abnormal condition of things are felt in the family, in the schools, in literature, in all society. Now for the present does there seem to be any available remedy.

COUNT TAAFFE'S CAREER.

Temple Bar contains a clever sketch of this Austrian statesman, whose Bill for the establishment of universal suffrage electrified the world a few weeks ago. From the account of the writer, it seems that this was but the crowning paradox in a thoroughly paradoxical career.

He is in politics a moderate Liberal, yet he has been hailed as chief by the Ultramontanes, high Tories, and fierce Radicals. He is devoted to progress, yet he has sanctioned the most reactionary of measures; in keen sympathy with the poor, he has passed laws intensifying the sting of poverty; a thorough-going educationalist—apparently at least—he has helped the priests to capture the schools. Whilst leading one party, he has constantly proclaimed his preference for the principles of the other; and when his own adherents have met with a defeat, he has carried on the government by the votes of their rivals. Amidst all his tergiversations, however, he has never forfeited for one moment the confidence of his sovereign, or the enthusiastic support of the more patriotic of his countrymen.

IRISH AND CZECH AND TEUTON IN ONE.

He comes of an old Irish stock: the Taaffes once "played an important part in Ireland," even to the extent of gaining a peerage. The family is now a fairly equal blend of Celtic, Czech, and Teutonic elements. Born in 1833, "he fought his first battles for the oppressed" on the playground of the gymnasium. As student, he was a thorough-going democrat. He rose rapidly in the service of the provincial governments. The Emperor and he had been as boys warm friends and constant companions, and when, after twenty years' separation, they chanced to meet again at Linz, they formed the close attachment which has lasted ever since. In 1867 he was called into the Imperial Ministry for the first time,—as chief of three departments! The courtiers "scoffed at his ill-made clothes, and marvelled that a man of his rank could eat and drink in third-rate restaurants, surrounded by clerks and tradesmen." "He is singularly lacking in the personal gifts by which most men win popularity: he is no orator, no genius." But the Emperor believed in him, and made him premier in the very next year. After less than two years in this office he resigned, and in 1871 went off as viceroy of Tyrol. He found the province poverty-stricken, ill-governed, discontented, oppressed under a badly adjusted taxation, and left it after seven years of vigorous reform, "one of the best governed and most contented provinces in the empire." In 1879 he became premier once more in a "ministry of reconciliation." Rejected by the liberals, his natural allies, he won the support of the other parties by lavish concessions—so much so that his official residence was dubbed "the concession market." Yet he was able often to neutralise reactionary concessions. "Not the least of his merits as a strategist is the power he possesses of taking back with one hand what he gives with the other; and of casting a glamour, as it were, over the husks he throws away." In his educational policy he secured as an administrator what he had seemed to surrender or imperil as a legislator. His protectionist policy is condemned, but as a set off are noted many useful measures of social legislation. In 1881 he lowered the franchise as far as his followers would let him. The writer declares that his last Bill must pass "sooner or later, in one form or another," and the electorate rise at a bound from 1,700,000 to twice that number. His policy in regard to the nationalities was finally rendered impossible by Czech extremists. In laying down his fourteen years' premiership, he has stepped aside—the writer is confident—"only for a time." The key to the Count's career is said to be this:—

By nature he is a straightforward, plain-dealing man; and it was only hard necessity that drove him to govern by playing off party against party, nation against nation, and lavishing on each in turn bribes, promises, and threats. In any other country in Europe a minister who played Count Taaffe's rôle would be a miscreant and a traitor; but in Austria it is otherwise; there opportunism is the one art of ruling.

MENDING THE BELGIAN CONSTITUTION.

RECONSTRUCTION of the British Constitution being contemplated by all parties, if we may judge by demands for Home Rule in Ireland and "all round," as well as by Conservative proposals for mending the House of Lords, a practical interest attaches to the Belgian Minister at Washington, Mr. A. de Ghait's account in the November *North American Review* of the recent Revision of the Belgian Constitution. The constitution of 1831 was based on the elective system, but the franchise was extremely limited.

THE REFERENDUM ROYAL.

The labours of the Constitutional Parliament, entrusted with the task of revision, are described by M. de Ghait with more unction than lucidity, but it appears that the following changes were decided upon:—"The *referendum* post was the constitutional right accorded to the King, to consult directly with the electors concerning a law voted by the Chambers, but of which the King hesitated to approve." To this has been added the innovation of a *referendum royal*, the right of the King to learn the opinion of the electoral body "either as to a question of principle, or concerning a law voted upon but not yet promulgated."

MANHOOD-SUFFRAGE PLUS PLURAL VOTING.

The conflict between advocates and opponents of universal suffrage resulted in adopting a system of plural voting: a combination of "one man one vote" with the principle of some men two votes or even three, but never more than three.

Universal suffrage is henceforth inscribed in the constitution for all worthy citizens of the age of twenty-five years, but conservative ideas are largely protected, by the addition of one or two votes to the heads of families and property owners. The voting power is also represented by the adjudication of a vote to the holders of diplomas whom the law will designate. The exercise of the right to vote is declared obligatory.

Members of the Lower House are to be paid 4,000 francs a year and free travel.

THE SECOND CHAMBER.

The make-up of the Senate, whose members are not paid, caused much difficulty. Eventually the Senators are elected by the voters like the members of the Lower House . . . according to a basis of population of each province, one Senator being elected for two representatives. To be eligible in this category it is necessary, in addition to the requirement of forty years of age, to pay 1,200 francs or to be proprietor of real estate representing a cadastral value of 12,000 francs. Besides the first category the provincial councils elect from two to four Senators for each province, according to the population, which will give twenty-six more Senators who are not submitted to the "cens" or property qualification.

Thus, election to the Senate by the direct popular vote is safeguarded by the heavy property qualification. Election to the Senate without heavy property qualification is safeguarded by the indirect election through the provincial councils.

One wonders whether our County Councils will ever be called on to play a part similar to the Belgian provincial councils in the election of a remodelled Upper Chamber.

A BASIS OF FACT IN SUPERSTITION.

MR. ANDREW LANG ON PSYCHIC PHENOMENA.

THE New Psychology, which is pushing its way on all sides, receives a friendly impetus in the *Contemporary* from Mr. Andrew Lang's discussion of "Superstition and Fact." The phenomena of hypnotism, once scouted by men of science, are, now, he points out, accepted; but by a remarkable coincidence these have in general testimony, both modern and ancient, been accompanied by other phenomena as yet unaccepted by science, such as ghosts disturbances, clairvoyance, telepathic hallucination. Are not these also facts? he asks.

SAVAGE PHILOSOPHY NOT WHOLLY UNFOUNDED.

Mr. Tylor's explanation of belief in ghosts and religion, as arising from savage reflection on dreams, trances, visions, leads Mr. Lang to say a word for the savage.

It is evident that, if clairvoyance does occur, and if the phantasm of the clairvoyant is actually seen, in the place which he fancies that he visits, and if appearances of men at the hour of death are, verily, beheld at a distance, then the savage's philosophy had more to go upon than mere dreams, shadows, sleeping, waking, and the contemplation of death. He was really in touch with disputed, unaccepted phenomena, and these phenomena are of high importance.

"Death-bed-wraiths" are not a peculiarity of the savage:—

Hundreds of living, civilised English men and women tell similar tales of their own experiences. Now, experiences of this kind are part of the basis of the primitive animistic theory. It reposes on psychical phenomena which, however we explain them, are by no means unusual.

Cases of telepathy "abound through all history and among all tribes of men, and in all conditions of culture."

SOME PSYCHIC FACTS.

Good evidence is becoming more difficult to get.

Yet, only yesterday, I met three sane and healthy English people who had simultaneously seen a ghost, in broad daylight, *sans le savoir*! They had each remarked on the presence of a young and pretty girl in a room where (as was incontestably demonstrated) there was only an old and plain woman, whom, of course, they also beheld. It was not till next day that they woke and found themselves famous, for what they had seen, though they knew it not, was the right thing to see—the traditional "ghost" of the place. But about this legend they were absolutely ignorant.

A distinguished statesman, from whom I have the story, once tested a so-called *clairvoyante* in the house of a celebrated physician. He did not ask her to describe his own house, which was well known to many, but he bent his thoughts on a very curiously decorated room in the house of a friend at a great distance. The *clairvoyante*, an uneducated woman, gave a correct description of arrangements so peculiar that I have never, myself, seen anything of the kind.

Nobody knows how far back the practice may go of what used to be called "divination by the mirror".—

It is an ascertained matter of fact that a certain proportion of men and women, educated, healthy, with no belief in "spiritualism," can produce hallucinations, pictures, by looking into a crystal ball.

A RECOGNISED "EXTENSION OF HUMAN FACULTY."

Mr. Lang, it appears, so far knows the causes of these facts as to denounce their usual interpretation as false:—

Where savage belief, and popular superstition, and, we must add, ecclesiastical opinion went wrong, was, not in accepting the existence of certain abnormal phenomena, but in the animistic interpretation of these phenomena.

That the hypnotic section of these alleged facts has been accepted by science, and that the residue may also possess a basis of fact, are the chief reasons which Mr. Lang has "for believing that an accepted extension of human faculty may be imminent."

SNUBBING THE FABIANs.

THE Fabian manifesto of revolt in last month's *Fortnightly* has elicited vigorous replies. Mr. H. W. Massingham in the *Contemporary* points out that if the workers are to join the Fabian wreckers, they must surrender the prospect of progress on the political side of the labour movement. They cannot themselves hope for years to come to constitute a turning force in Parliament, and they cannot exact any terms with Tory allies which would cover either payment of members—the key of the democratic situation—a manhood suffrage, or electoral reform, or even the abolition of the property vote. . . .

If the industrial education of the Liberals is incomplete, that of the Tories has not even begun. Conservatism did not supply a man or a principle to the progressive movement in municipal affairs which in four years has swept all through England.

THE RADICAL HEAD AND THE CAPITALIST TAIL.

In the absence therefore of complete treachery to the workers by the Liberal party, I imagine that the bulk of the trades-unionists will do what they have previously done with perfect consistency—give their votes to those Radical candidates who are with them on vital points and withhold them from the capitalist "tail."

Mr. Massingham concedes that "Mr. Fowler, as Minister for London, has been but an equivocal success." "It is Mr. Fowler's misfortune that he regards Wolverhampton much as Mr. Chamberlain regards Birmingham, and is unaware of the fact that the modern Radical movement dates from London." He also allows that the Government has not carried out the *rôle* of the model employer "who pays trade-union rates of wages, observes the trade-union limit of hours, and deals with 'fair,' as opposed to 'unfair,' houses."

MR. GLADSTONE AND PAYMENT OF MEMBERS.

"On one point there has been something very like betrayal." Sir William Harcourt would have introduced an equalisation of the death duties, steeply graduated against the larger estates, and would have provided for payment of members; but Mr. Gladstone vetoed the project. Mr. Massingham insists—

The Government must reorganise itself as a "fair house," and we must have payment of members. If these things are not done . . . it will be swept off its feet by that encroaching tide of Conservatism which, not in England only but all over Europe, has almost eaten away the old Liberal movement, and may, for a time, submerge the new Radicalism.

WHAT MR. MICHAEL DAVITT THINKS.

Mr. Michael Davitt in the *Nineteenth Century* deals much more trenchantly with what he calls "Fabian Fustian." He regards it as inevitable that Great Britain, like the Australian colonies, will have its Parliamentary Labour Party, but not necessarily in the political tutelage of the Fabian Society.

The object of the Fabian Society, as plainly discerned between the lines of their new policy, is to induce the working men of Great Britain to desert the Home Rule cause, and help to return its enemies to office at the next General Election.

Mr. Davitt is much amused with the modest claims of the Fabians to have educated the people in Collectivist principles. The body which has done most for the spread of these principles is, he maintains, the Social Democratic Federation, whose members are *bonâ fide* workers, not *bourgeois* like the Fabians, and which has included Labour leaders like Burns, Mann, Tillett.

LABOUR AND HOME RULE.

None of these have ever tried to antagonise British Labour and Irish Home Rule.

The working classes of Great Britain know that in Home Rule and Home Rulers they possess the truest and strongest allies outside of their own ranks and organisations.

WHAT A DAILY NEWSPAPER OUGHT TO BE.**AN AMERICAN JOURNALIST'S IDEAL.**

MR. WILLIAM MORTON PAYNE, associate editor of *The Dial*, who writes from some score years' of editorial experience, sets forth in the November *Forum* his notions of "What a Daily Newspaper Might be Made." He does not spare his fellow journalists. "Men of intelligence everywhere are," he says, "profoundly dissatisfied with the American daily newspaper; they believe it to be both vulgar and dishonest, and they find that these qualities have grown increasingly prominent of recent years." This is his "fundamental classification of the duties incumbent upon any newspaper conducted upon a high ethical plane":—

1. As a collector of news, pure and simple, its work should be done in the scientific spirit, placing accuracy of statement above all other considerations.

2. In its selection and arrangement of the news thus collected, it should have regard to real rather than sensational values; it should present its facts in their proper perspective (which is still, of course, a very different perspective from that required by permanent history); and it should carefully exclude, or at least minimise to the utmost, those facts which it cannot possibly benefit the public to know, or of which the knowledge is likely to vulgarise popular taste and lower popular standards of morality.

3. In its comment upon the happenings of the day or the week, it is bound to be honest, to stand for well-defined principles, to express the sincere convictions of its intellectual head and of those associated with him in the work.

WHAT THE THREE REQUISITES INVOLVE.

The unveracity of existing journalism is due to partisan and personal prejudice and to ignorance. The ideal newspaper will not be a party organ, nor bid for "job-lots of votes." It will be free from vindictiveness. It will employ educated men specially fit for their special work. Local and immediate interest must largely decide the proportion of prominence and general perspective.

Crimes and scandals must be chronicled, but they should be chronicled in the briefest possible way, and with as little display as possible. . . . The ideal newspaper . . . will if some transatlantic journalist shall see fit to recount his explorations of a new "modern Babylon," refuse to receive the foul matter from the cables to spread it broadcast over a land which it cannot possibly concern.

The editorial page, as "the most important part of the paper," will "compel attention," and "really give its readers the guidance they have a right to expect." "One of the most noteworthy signs of the process of newspaper degradation that recent years have witnessed has been the steady deterioration of the editorial page." Drama, music, and art criticism should be well-informed, instructive, and anonymous. Only the newspapers in a few cities which are centres of art need to have art-critics at all. The ideal newspaper will have "an important editorial department devoted to the general subject of education, and particularly to local educational work." It—

will not be illustrated, except for a few cuts of diagrams, sketch-maps, and other necessary adjuncts to the text. The experiment of making daily picture-papers has been fairly tried, and it has proved a failure. The illustrations do not illustrate, and they are unsightly in the extreme. . . . The reporter will be a scholar—which now he is not often—and a gentleman, which now he is frequently not permitted to be.

TWO WAYS OF GETTING IT DONE.

"Purity of motive, knowledge, and ability to write the English language are the prime qualifications."

They are all to be had, as well as executive genius to control and direct. A few newspapers, both in England and America, come near the ideal, and are commercially successful. But—

By what means shall the American public receive the great and much-needed object lesson in journalism? It may be done, in the first place, by purchasing some established paper, placing it in the hands of a body of experienced and large-minded men, increasing its expenses to whatever extent may be necessary to accomplish the desired end, and taking the chances of ultimate commercial success.

Mr. Payne tells a good story of the London *Morning Herald*. To force one of the partners to retire, the rest ordered all profits to be spent on the paper. The only result was great increase of circulation and still larger profits!

But to secure a clear record from the start,

A great newspaper might be established and maintained by endowment, just as great universities are so established and maintained. The analogy between the two undertakings is very close. . . . The endowment plan would have the inestimable advantage of doing away with the unceasing conflict between editorial conduct and business management, and thus with the tap-root of the whole evil. . . . Whatever the plan of the ideal newspaper, it must at least hold out the prospect of real editorial independence.

Mr. Payne concludes by insisting that journalism is a profession closely akin to the work of educator, clergyman, and lawyer, and should be not less free from commercial taint. The idea of buying up a newspaper for sordid ends should be held as monstrous as the suggestion of a syndicate of Mormons buying up Plymouth Church, pastor and all, to advocate polygamy.

AGAINST THE DESPOTISM OF DOCTORS.

THE *Arena* for November contains an impassioned protest by Henry Wood against "Medical Slavery through Legislation." The writer loudly complains that if any man in the gloriously free Republic chooses to be healed of a disease by the help of an "irregular" practitioner, the healer is "liable to arrest, punishment, and classification as a felon."

"If a man chooses to die without the aid of a 'regular,' it is rather severe that he cannot have an orderly burial without his post-mortem services."

"Citizens of the despotic governments of Germany, Austria, and Russia have a larger medical liberty than that enjoyed in most of the states of the American Union."

"In the whole sisterhood of states, only three—Maine, Massachusetts, and Rhode Island—remain entirely free from medical usurpation."

Even if allopathy were an exact science like mathematics, rival systems would still have a right to a fair field and no favour, but allopathy notoriously is not. "There is no other profession or occupation that expects to have a clientage furnished through Government coercion." Again—

Why are prescriptions written in Latin—and generally in bad Latin? The practice was begun in a more ignorant age, to make a profound impression of mystery and great learning. It was a kind of charm, and the profession may have blindly recognised that it included a real psychological factor. Its present practical use, however, seems to be to furnish additional chances for mistakes by druggists' clerks, and to enable them to charge exorbitant prices for simples disguised by formidable Latin names.

HOW TO SAVE AN INSOLVENT STATE.

A BOLD SCHEME FOR OUR "BANTAM" SETTLEMENTS.

THE *Investors' Review* continues its brilliant but Jeremician rôle in the November number. The scathing series of articles on "The Bantam 'States' of Australasia" is closed with a woe-inspiring summing-up. The prospects of "thirsty South Australia" are painted with a very dark brush. Its rainfall in the south is extremely small, and is probably growing smaller. The soil is baked with the heat, the yield of wheat is often only five bushels to the acre, "the production of cereals—of any crop—upon a large scale is bound to be, one year with another, a losing industry." Judicious irrigation, at a great cost of labour, might develop fruit-growing industries if there were, as there is not, a large population. "The population as it now stands can in no sense be expected to pay the debts it has contracted." "Pleasant Tasmania" is given a better chance. "It is a little wet, perhaps," at certain seasons, but has, on the whole, a delightful climate. Its debt of seven millions for a people numbering 150,000 is "too much, of course, but it is not perhaps a deadly matter, and Tasmania may possibly pull itself out of this slough" if her statesmen will economise and borrow no more for a decade. Of "empty Western Australia"—unless its people are prepared entirely to surrender great portions of their territory to other races, and so to introduce into the continent an element of future strife—we must expect the advancement to be "excessively slow, and that only the southern part will be peopled with whites."

"SUPPOSING THEY DEFAULT."

The "general conclusions" are even more gloomy:—

Not one of these colonies can, we are persuaded, escape a prolonged time of misery except by way of a composition with their creditors. . . . These settlements ought to have no more of our money until they have put their affairs in order; until they honestly show us what they can do unaided. . . . They have hardly taken the first step towards placing their finances upon a trustworthy basis.

"Supposing they do default," what is to be done? The idea of turning them into Crown Colonies is dismissed with ridicule. Representative Government has been a "miserable failure," but the democracies "must be left to work out their own salvation." They are not ripe for federation. They need the reforming stimulus of emulation. No constitutional change is called for unless it be "a more complete severance" from the mother country. "They get no good whatever from those colonial governors who are sent out to them to ape majesty, and who are only a source of useless expense to the people and a fountain of miserable snobbery." This might mean "cutting the painter" "in a sense."

"A COMPREHENSIVE PLAN."

The great obstacle in the way of Colonial recuperation is the fact that the land is not free; "all has been grabbed, and jobbed, and mortgaged"; the needed population cannot therefore be induced to settle. These prospects lead the reviewer to think that, before the colonies can get more loans, and "the final crash comes,"—

a comprehensive plan ought to be meantime formulated and perfected, whereby the whole of the burden of the debt—the three hundred odd millions of money which this country has poured into Australia, and taken pledges for—might be consolidated into sets of obligations in certain priorities.

More than immediate or local interest attaches to this plan put forward by one of our ablest critics of finance, and a man least inclined to visionary schemes. How to

get a State out of the Serbonian bog of over-indebtedness is a problem which may demand attention nearer home when the strain of militarism reaches breaking point.

CONSOLIDATE ALL DEBTS.

This is the reviewer's solution:—

The obligations of each colony of all degrees should be arranged in an equitable order of precedence. Put the direct Government debts first. Consolidate the debt of New South Wales and Victoria, each in its own country, and ascertain what would be the reasonable probability of payment of interest upon this debt, assuming that interest to be reduced to a figure lower than is now promised. Say that they were consolidated into a first charge upon the revenues of the country at 2½ per cent. as a starting-point, with ½ per cent. sinking fund to be applied annually.

Then, coming immediately after this first charge, place all the mortgages upon the land which are first mortgages held by companies or banks, and consolidate these into a stock ranking second, and entitled to, say, 3 per cent., after interest and amortisation upon the first portion had been paid. A sinking fund should be arranged for here also, to come into play at a future date.

Behind these, the lower obligations might rank as a third, or even a fourth stock, on which also 3 per cent. would be paid when the stocks ranking higher had been satisfied. Limits should be fixed for all the stocks above which they would not be drawn for redemption, but they might be cancelled by purchase in the market under those fixed prices. Surplus revenues might be devoted partly to the purchase of the lowest class of debts in the market at fixed prices, partly to meet colonial wants.

NATIONALISE THE LAND.

The corollary to this would be "the cancellation of all leases or sales of land on which the money had not been paid, bonds of the various consolidated debts to be given in exchange."

The colonists should, if possible, be induced to pass a fundamental constitutional law forbidding to all future time further alienations of the soil in fee simple; not even "homestead" farms ought to be exempt from rent to the State. The land not already sold and fully paid for should be exclusively freehold property of the State henceforth and always. . . . How the rent is to be assessed would be a matter for experts to determine, but it ought to be a rent never exorbitant, and yet one that increased up to a certain point in proportion as the land became productive. . . . Upon their land the people ought to be taught directly to rely for the income of the State. All tariff abominations should be swept away.

The Origin of the Name America.

THE much-debated question of the origin of the name America is considered by Dr. John Murray, of the *Challenger* expedition, in a most interesting article in the *Scottish Geographical Magazine* for November. He points out that in the Cantino map—the oldest but one of the New World, prepared in part, it is believed, by Vespucci—the name *Tamarique* occurs "towards Darien and in the direction of Nicaragua." To this day, a little to the westward of Nicaragua is a range of mountains called *Sierra Amerrique*, inhabited by a tribe (once widely extended) called *Amerriques*. Again *Amarca* or *America* is shown by their Sacred Book to have been the national name of the Peruvians. *Tamarique* is therefore supposed to stand for *Terra Amerique*. Dr. Murray observes:—

It was an age of nicknames. What more natural than that Vespucci should be called America Vespucci? His Christian name of Amerigo would lend itself to, or even suggest, the nickname. It is possible that the New World may have given Vespucci his celebrated name of Americus, and not Vespucci his Christian name to the New World.

He quotes as example the case of "Chinese" Gordon.

NAPOLEON'S PRISON-VOYAGE.

THE second instalment from John R. Glover's hitherto unpublished diary of Napoleon's voyage to St. Helena appears in the November *Century*, concluding with a pathetic note to the effect that the author was "particularly averse that any part of it should get into print." He reports a conversation of the great captive on the project of invading Ireland, which Unionists may feel not wholly without meaning for modern times.

He said he had kept up constant communication with the disaffected party, which he averred was by no means confined to the Roman Catholics, but had also a very large proportion of Protestants. He said he invariably acquiesced in everything they wished for, leaving all arrangements respecting the country, religion, etc., entirely to themselves, his grand and only object being to gain the advantageous point for him of separating Ireland from England.

Referring to his early days,

He said it was not until after the battle of Lodi that he entertained an idea of ever being sufficiently of consequence to authorise his some day or other interfering with the government of France.

CROSSING THE LINE.

On the day the ship crossed the Equator, the ex-Emperor wanted to give the sailors one hundred napoleons, but so heavy a largesse the admiral would not allow; whereupon Bonaparte refused to give even the smallest coin. "His spirits are even," remarks Mr. Glover, "and he appears perfectly unconcerned about his fate;" but when the vessel reached St. Helena he "delayed disembarking until it was dark, to avoid the gaze of the inhabitants," and he seemed to "loathe the sight of a British soldier."

"BONEY" PLAYING BLIND MAN'S BUFF.

A refreshing glimpse is given of the man as guest in the house of a Mr. Balcombe, who had two daughters, one fifteen, the other thirteen:—

Bonaparte appeared much delighted in their society. These young ladies in a few days became perfectly familiar, and the general seemed highly pleased with their naïveté, particularly that of the younger (a pretty girl, and a most complete romp when out of sight of her father). He occasionally so completely laid aside his imperial dignity as to romp with these young ladies, who during such diversions as "Blind-man's Buff," etc., called him by the familiar appellation of "Boney"; indeed the younger, who appeared his favourite, said anything and everything to him her lively imagination dictated, asking every possible question, and he answering without the slightest apparent reserve.

Thus sentimentally does Mr. Glover sum up the impression left on his observant mind by the illustrious Corsican:—

Greatness of mind or character in my opinion he possesses not, very frequently acting the part of a spoiled child. Feeling I consider him devoid of. Every religion is alike to him, and did I believe there existed such a being as an atheist, I should say Bonaparte is that being. Of those about him he seems neither to care nor feel for the privations they undergo from their blind and infatuated attachment to him.

THE Society for Promoting Christian Knowledge has surely reached the very utmost limit to which literature can descend in the way of cheapness by their Penny Pocket Library of Pure Literature. Five volumes of this library have just appeared: Southey's "Life of Nelson," Cooper's "Last of the Mohicans," Scott's "Talisman," Marryat's "Masterman Ready," and Kingston's "Owen Hartley"; and when everything is considered, paper and print are very good. The books are better and really more interesting than the "penny dreadfuls."

BISMARCK AT HOME.

MISS ELENORA KINNICUTT contributes to the *Century* for November a bright sketch of her visit to Friedrichsruh in the summer of 1892. The old man at home is shown in a very agreeable, not to say lovable light. His table talk seems to have been charming.

His language was so graphic, brilliant, and varied, and flowed on with such fulness of thought and illustration, that the desire not to lose or forget a word made the strain of listening to him great. It recalled what I had once heard a man, himself with a world-wide reputation for eloquence, say—"To have heard Bismarck and Mazzini talk is to have enjoyed something that can never be described." And in all that Bismarck said there was not one word of censure, reproach, or disloyalty for his sovereign! There was an occasional flash of humour, a sudden restraint in speech—that was all.

"THE SECURITY AND STRENGTH" OF AMERICA.

In talking about America, he said:—

"The security and strength of your country lie in the fact that the American race is a mixed one—a 'Sammelvolk.' History has never made a great people in any other way. Look at France. It was the invasions from Italy and the north that gave her bone and sinew. Spain was strongest because she sucked in Iberian blood. And England—what made her so great? Not the invasion of the Anglo-Saxons only, but the fact that there they joined hands with the Normans. A people may be comfortable and prosperous without an influx of foreign blood, but it will cease to be capable of great things whenever that ceases." Continuing, he said: "The Americans, to my mind, have overdone the Columbus worship. The Norwegians were the first discoverers and settlers of America. Columbus was a map- and chart-maker, and, before setting out on his own voyage, had positive proof of the existence of other continents. . . My only relation with America nowadays is receiving letters from young ladies who ask me for my autograph."

"THY WILL BE DONE."

Of bi-metallism he remarked:—"England must face the subject some day, for she has a big silver nail in her body—India."

Reverting to "Germany and the evils of the day,"

"Fortunately for me," said Bismarck, "when I was very young I learned to repeat the Lord's Prayer, and truly to mean it when I said, 'Thy will be done.' And this I still say, and so nothing ever really troubles me."

This is a pleasanter picture of the Grand Old Man of Germany than political newsmongers have been wont to give us. By-the-bye,

A great pleasure to Bismarck, and one that serves him well in old age, is the planting of trees—unlike the other great old statesman of our time, whose delight has always been in cutting them down, a difference which might perhaps by some be used to point a political lesson.

Sir Edwin Arnold as Saviour from Suicide.

How well worth living life is has been of late the theme of Sir Edwin's prose muse. How he proved it to the satisfaction of a would-be suicide is told by him in an interview which appears in the *Woman at Home*:—

A poor man, broken-hearted through disappointment and want, came to me and told me that he was tired of life, because he had nothing in the world to live for. I saw that the man was terribly in earnest, and that he had almost made up his mind to commit suicide. I asked him to grant me a favour—namely, to give himself up entirely to me for two days, during which he should follow my instructions and counsel implicitly. When he came to me, prepared to do as I bade him, I brought him into contact with people to whom he could be eminently useful in his way, and thus he became aware of the fact that he had a *raison d'être*, and that, after all, he had something to live for. This very man who, not so very long ago, was meditating self-destruction, has now grown to be an indispensable being to a great many of his fellow-creatures.

FRENCH LITERATURE BECOMING MORAL.

THE moral regeneration of France, for which even religious optimists once ceased to hope, shows many signs of becoming actual at last. As letters mirror life, "the new moral drift in French literature" described by M. Paul Bourget in the November *Forum* is a pleasing confirmation of the upward tendency. M. Bourget draws a picturesque contrast between the literature of 1880 and that of 1893. The novel then, aiming at "the humble truth," ignored spiritual life, moral initiative and effort; now, cases of conscience form its habitual theme. "Poetry, formerly realistic, sometimes to the point of brutality, tends to-day to become idealistic even to symbolism." Then it sought to rival painting; "to-day it models itself on music." "Criticism also, from being positivistic and wholly documentary, has become again philosophic and moral." The theatre, long recalcitrant, now leans to Ibsen.

While romance, poetry, the theatre, and criticism are engaged more and more with moral questions, the symptoms of a veritable religious renaissance are discernible among the young. True, the group of the so-called "Neo-Christians" is not very numerous. Nevertheless, it exists.

THE POSITIVISM OF DEMOCRACY AND SCIENCE.

M. Bourget regards this "moral crisis" as "the direct and inevitable outcome of a general spiritual advance" in France during the last fifty years. He traces it from the advent of the Second Empire—democracy in its Latin form of Cæsarism—equality aggravating the struggle for life.

To say that democracy triumphed in 1852 is to say also that the cult of material interest began to predominate from that epoch with singular intensity. . . . Positivism of ideas had triumphed at the same time through science. At that date, 1850, the principal results of the experimental method were known. This transformation was almost overwhelming, by its rapidity in the world of metaphysics and in the industrial world, and it extended almost as quickly in the world of literature. . . . Democracy and science fraternised at every step.

Money, not passion, as in 1830, or intellect, as in 1840, became the motive of the drama. The novel embodied the exact "scientific analysis of sensation." M. Renan attempted a natural history of religions. De Lisle zoologised poetry; Baudelaire made it the implacable vivisection of human misery. M. Taine defined literature as a "living psychology" with science as its end.

THE CLIMAX OF "FLAGRANT REALISM"—AND AFTER.

In this idolatry of science and scientific experiment grew up the young people who began to write before 1870. "The most typical among them, whose work will live in years to come as the monument of an astonishing genius," was M. Emile Zola. The programme of "what has been called the 'naturalistic movement,' but which might more exactly have been called the 'positivist movement,'" was "to reduce the literature of imagination to the rigour of an observation or even of a scientific contribution." Hence its "flagrant realism." But the positivist reverence for facts could not finally ignore "the inner world of ideas and sentiments," of distraction, doubt, joy and remorse, which were also positive facts.

It was thus that, beside physiological realism, if one may so term it, another sort of realism manifested itself, which we may call psychological. . . . The literature of scientific observation was constrained to unfold into a psychological literature. It was impossible that this last should not encounter on its side the problems of moral life. . . . In other words, the problem of sin appears, and, once apparent, may be no longer neglected.

French literature would have followed this route, even if left to itself; but two causes arose to precipitate it.

ENGLISH AND RUSSIAN INSPIRATIONS.

The first was the somewhat factitious or artificial influence of foreign literature. Frenchmen suddenly discovered the "universe of lyricism," "which glittered with the names of Shelley, Keats, Wordsworth, Tennyson, Browning, Swinburne, and Rossetti," and "were intoxicated by it." M. Daudet in 1888 said that "most young Parisian critics made their *début* with a study of Shelley." Similarly, Russian literature was unveiled in the writings of Tolstoi and Dostoiewsky. The second cause—more durable because more national—is the "period of definitive metamorphosis," with its range of political and social problems, which France is now traversing.

At this moment, among the young people just on the threshold of manhood, there is a sentiment of national duty intense almost to the point of passion, a fervent desire to do strenuous work in the service of their country, a conviction that the agnosticism of science is not adequate to the creation of useful energies, an ardent and sorrowful anguish in religious problems. These are the young people whose intimate perplexities M. Paul Desjardins has explained in pamphlets which have made too much stir not to express a general mood.

This outlook is cheering from other than a purely French point of view. If the moral and religious pioneers of the new era in France experience and avow their indebtedness to the inspiration of English as well as Russian literature, the early result must be a powerful check to the political hatred of England. The awakener of the French conscience cannot be simply set down as "perfidious Albion."

"LITERARY MODELS" FOR ARTISTS IN FICTION.

In "A Dialogue between Frank R. Stockton and Edith M. Thomas," daintily recorded by the latter, with picturesque illustrations, in *McClure's Magazine* for November, the novelist and the poetess exchanged confidences about their respective crafts. Mr. Stockton made an interesting comparison between the arts of the brush and the pen, with a practical suggestion which the realistic novelist may find of value. He said:—

I have been thinking why it is that very often the work of an author of fiction is not as true as the work of an artist, and I have concluded that the artist has one great advantage over the author of fiction, and over the poet even. The artist has his models for his characters—models which he selects to come as near as possible to what his creations are going to be. The unfortunate author has no such models. He must rely entirely upon the characters he has casually seen, upon reading, upon imagination. . . .

I think the beautiful young heroine of fiction generally gives the author of love stories a great deal of trouble. Such ladies exist, and their appearance may be described; but it is very difficult to find out what they would do under certain conditions necessary to the story.

I have sometimes thought that a new profession might be created—that of Literary Model. Of course we would have none but the very highest order of dramatic performers, but such assistance as they might be able to give would be invaluable. Suppose the writer wanted to portray the behaviour of a woman who has just received the tidings of the sudden death of her rejected lover. How does a writer, who has never heard such intelligence delivered, know what expressions of face, or what gestures, to give to his heroine in this situation? . . . The professional literary model might be enormously useful in delineating the various phases assumed by one's hero or heroine. . . .

It might be a good idea for a novel-writer to have a study near the green-room of a theatre, and then between the acts he might send for this or that performer to give him a living picture of a certain character in a certain situation. It might not take a minute to do this.

WAS SHAKESPEARE AN "AUTOMATIC WRITER"?

THE Shakespeare-Bacon question has been discussed for several months in the *Arena*. In the November number the discussion draws to a close. Writing to his daughter, the late Richard A. Proctor, the noted astronomer, treats the theory of Baconian authorship as a mental curiosity, which has only lived by being seriously opposed. "A school of flat-earth men, another of circle squares, would soon be established, if science did not very rigidly leave the paradoxers alone, or else—which has been my own constant custom—deal with them" as specimens of mental pathology. The acknowledged Shakespearian authorship of "Venus and Adonis" carries with it, Mr. Proctor contended, the Shakespearian authorship of the plays. To attribute the plays to Bacon is like attributing the poems of Tennyson to Thomas Carlyle.

SHAKESPEARE A "MEDIUM" OF "OCCULT" FORCES.

Mr. A. B. Brown applies recent knowledge of "automatic writing" to the problem.

Believing that hidden and unseen forces work external results in mental as in material unfoldings, the writer would ask if Shakespeare may not have been a medial subject in the hands or under the control of some hidden intelligence, force, or potent power, through which Shakespeare's organism afforded opportunity for such intelligence to work phenomena upon the external plane of life? . . . Is it not very probable that he possessed—to a very large extent—those medial powers which it is now well known are the inheritance of many men and women of to-day, and which distinguished both seers and sages who preceded Shakespeare? In all biblical and historic literature, such gifts enter largely into the inspirational manifestations of infinite force, through seership and prophetic revelation. . . Can it not be reasonably certain that Shakespeare lived, wrote, and had his objective life within such an environment, where the two elementary forces of nature, the dominant in objective life and the controlling in subjective living, join their potent forces and give equal opportunity for the soul to reveal its thought, and to give through the *automatic pen* the writings which, some at least believe, neither Bacon nor Shakespeare, of himself, was capable of producing?

MR. HENRY IRVING'S VIEW.

Mr. Irving writes that he has "never been able to take any serious interest in this controversy":—

The apex of the ludicrous was touched when Mr. Ignatius Donnelly wrote a stupendous work to prove that Bacon wrote into Shakespeare's plays a narrative in cipher full of historical incidents which never happened. . . Why not argue that the total lack of imagination, of the poetic faculty, and of the sense of humour revealed in Bacon's published works, is a proof of his deliberate purpose to prevent any identification of his genius with Shakespeare's? That would be quite as convincing as the famous cipher. The theory of "composite authorship" is a weak and waddling compromise. . . When the Baconians can show that Ben Jonson was either a fool or a knave, or that the whole world of players and playwrights at that time was in a conspiracy to palm off on the ages the most astounding cheat in history, they will be worthy of serious attention.

Out of the twenty-five celebrities who have given judgment in the *Arena*, only one (Mr. G. Kruell) favours the Baconian authorship, two (including Miss Frances E. Willard) accept the composite authorship, two believe neither Shakespeare nor Bacon was author, and twenty vote for the Shakespearian authorship. To the last class belong Alfred Russel Wallace, the Marquis of Lorne, Edmund C. Stedman, Edmund Gosse, Luther R. Marsh, William E. Sheldon, Henry George, and Henry Irving.

CLIPPING THE LAURELS OF COLUMBUS.

IT is a question whether the celebration of the fourth centenary of Columbus' discovery of the New World has added to or taken from the great navigator's fame. Of the class of facts now everywhere disseminated which have somewhat shorn Columbus of his traditional glory, interesting reminders are given in a paper by Dr. John Murray, of the *Challenger Expedition*, in the November number of the *Scottish Geographical Magazine*.

FORESTALLED BY THE NORSEMEN.

He tells of the Norsemen who discovered and colonised Iceland and Greenland in the ninth century, and went on to forestall Columbus by well nigh half a millennium.

In the year 1000 Leif Erikson and his companions discovered the coasts of Labrador and Newfoundland (Helluland), Nova Scotia (Markland), and New England (Vinland), but the voyages of these bold mariners were wholly unknown to the nations who did not speak the ancient language of the North. . . . The settlements formed by Thorfinn and others early in the eleventh century were soon abandoned, and in 1347 we have the last record of a voyage to America. . . . It is doubtful if Columbus had ever heard of these voyages.

ANTICIPATED BY ANCIENT GREEKS.

The Renaissance, dispelling the geographical night of the Middle Ages, brought to light the ideas of the scientific Greeks. Aristotle had established the sphericity of the earth, and argued that India and the Pillars of Hercules were near to each other. Eratosthenes (third century B.C.) had estimated the circumference of the earth at 25,000 geographical miles. The Italian poet, Pulci, published in 1481 a poem in which he predicted "the discovery of a new hemisphere and the circumnavigation of the globe":—

... his bark
The daring mariner shall urge far o'er
The western wave, a smooth and level plain,
Albeit the earth is fashioned like a wheel. . .
... Hercules might blush to learn how far
Beyond the limits he had vainly set
The dullest sea-bont soon shall wing her way.
Men shall descry another hemisphere,
Since to one common centre all things tend.

— Such was the intellectual atmosphere in which Columbus formed his great enterprise.

ECLIPSED BY MAGELLAN.

The palm of "the most extraordinary voyage on record" Dr. Murray awards to Magellan, when for ninety-nine days he ploughed the waters of the Pacific—a voyage "far surpassing the exploit of Columbus in the Atlantic, both in boldness and in the effect it produced on geographical conceptions. Though he died at the Philippines, and though—

only one of his vessels ultimately reached Spain, Magellan had finally solved the problem of western navigation, the sphericity of the earth, and the existence of the Antipodes. . . . Fifty-seven years elapsed before Drake accomplished the second circumnavigation of the globe.

The whole review of geographical progress leading up to and beyond Columbus is masterly and replete with valuable information. The appended "maps of the world, according to early geographers," constitute in themselves a liberal education in the evolution of geography.

COUNT PAUL VON HOENSBRÖGHE, whose confessions, after he quitted the Jesuit Order, made such a stir a few months ago, supplements his former account of modern Jesuitism by an article of fifty pages, which he has contributed to the *Preussische Jahrbücher* for November.

SHALL THE UNITED STATES ABSORB CANADA?

I.—A FRENCH CANADIAN ANSWER.

THE overtures now being made by the Canadian Ministry to the Government at Washington in the direction of establishing commercial reciprocity between the two countries lend a fresh interest to the old question of their prospective political union. The subject is discussed—and from opposite standpoints—by two well-known Canadians in the *Forum* for November. Mr. Louis Frechette, late member of the Dominion Parliament, and “foremost poet of Canada,” declares he writes as interpreter of what he believes to be the opinion of most of his compatriots, the French Canadians in the province of Quebec. That one who professes to speak in this representative way should head his article with the motto, “The United States for French Canadians!” will probably occasion surprise on this side of the ocean. Mr. Frechette argues that the Canadian Confederation must give place to a more definite arrangement; whether it be Imperial Federation, or Canadian Independence, or Annexation with the States.

“OUR MOTHER-COUNTRY IS FRANCE!”

French Canadians, he says, are a “conquered people,” and do not regard themselves as pledged to everlasting loyalty to their conquerors, whom “by the influence of tradition they cannot but instinctively consider in a vague way as the ‘hereditary enemy.’”

Not that they in any way entertain the slightest hope or desire to resume their former allegiance to France; but they feel themselves French, they are proud to be so, and are bound to remain so . . . Our mother-country is France! If ever a conflict should arise between her and England, which God forbid—it is hard for me to say so, but it is true—we should be for France. Treason! some may cry. Nonsense; for our forefathers never voluntarily consented to become British subjects, and if we are such it is against their will and ours.

So Imperial Federation “must be absolutely thrown aside.”

How could we be expected to consent to an infeoffment not only with the United Kingdom, but also with distant countries like Australia, the Indies, East and West, and those other lands spread all around the globe, with which, although parts of that “Empire upon whose flag the sun never sets,” we have no more natural connection than with the planet Mars?

ENGLISH AND FRENCH “INEVITABLY HOSTILE.”

Independence for the province of Quebec alone “is dreamed of by no one”—

Whether we become federated with the Empire or recognised as an independent nation, Canada must stand as a whole, with a government neither English nor French, but Canadian. Our only ambition, as French Canadians, would be to have our legitimate share of influence therein.

But what would that influence amount to in face of a majority “inevitably hostile”? Mr. Frechette uses the word hostility advisedly; for it is a—

hostility which arises from the distinctive character of two races that differ in religion, language, habits, customs, sympathies, aspirations, and even in physical externals; . . . that hostility, in short, which is born from the juxtaposition of two different nationalities on the same soil—like two lovers before the same woman—one of whom some day must win.

“Permanent Independence” is therefore dismissed as “impossible or dangerous.”

CONTINENTAL BLISS “AT ONE STROKE.”

Annexation has been a phrase most unpopular; but “the generous and universal hospitality extended to eleven or twelve hundred thousand French Canadians living in the United States to-day has completely wiped

out all traces of the old animosity.” The clergy have “considerably altered their opinion.”

The idea of Annexation has, during the last few years, made rapid progress with Canadians of French origin; the fact is that, even to-day, were they consulted on the question under conditions of absolute freedom, without any moral pressure from either side, I am certain that a considerable majority of Annexationists would result from the ballot. And this majority cannot but increase.

Mr. Frechette waxes enthusiastic over the prospect.

Alliance with the States of the Union would with one sweep of the pen settle all those thorny questions which now embarrass us. At one stroke . . . we should have no more hate, or rivalry of faith or race; no longer conquerors ever looking upon us as the conquered; no longer any joint responsibility with any European nation; no longer any frontiers; no longer any possible wars; a single flag over the whole of North America, which then would be, not the holding of any particular nation, but the home of Humanity itself, the Empire of Peace, the richest and most powerful dominion of the Earth, under a democratic government.

II.—AN ENGLISH CANADIAN VIEW.

“Canadian Hostility to Annexation” is the theme of Mr. J. Castell Hopkins, late Secretary of the Imperial Federation League in Canada and associate editor of the *Toronto Empire*. He thus summarises “the conditions of the annexation problem”—

Canada is contented with her present national position, and conservative Canadians entertain a profound belief in the superiority of the British system of government over the American. They think the institutions, laws, morals, finance and legislation of the Dominion superior to those of the United States, and they would not care to risk serious changes through annexation. They are every year becoming more attached to Great Britain and more grateful for the power and liberty which can be obtained within the British realm. They are afraid of American aggression, suspicious of American dislike to the mother-land, averse from the necessity which would exist of hostile fiscal legislation under annexation, and of possible future conflict with Great Britain. They are becoming profoundly interested in the British market, as opposed to the old “sixty million market” theory, and have defeated by an overwhelming vote unrestricted reciprocity schemes which seemed to involve trade discrimination against England. Their commerce, railways, steamship lines, cable projects, and waterways all converge, east and west, toward Britain and British countries, instead of south to the United States.

III.—MR. ERASTUS WIMAN'S VIEW.

Writing in the *Engineering Magazine* for November on “Canada and Our New Tariff,” Mr. Erastus Wiman avers:—

In no part of the Empire is the temptation toward secession so great; in no part would secession be so complete and so fatal to the prestige of the Empire as in the case of Canada. Measured by the effort which Great Britain put forth in the War of Independence to retain the American colonies, the secession of Canada would be the most stupendous event at present possible to the Mother of Nations. The possibility that Republican institutions should suddenly pervade so vast a proportion as forty per cent. of the Empire over which the monarchy rules would do more to sap the foundations of that monarchy itself than any other possible event. Such a contingency, following the yielding tendency towards Democracy apparent in recent legislation in Great Britain, would be regarded by many as the first step towards reducing England to the position of a second-rate power, lessening her military and naval force, and eventually resulting in a serious set-back to civilisation. . . . Yet to those who understand the Canadian people and are familiar with the political, social, and commercial forces that prevail, both in the colony and in the mother country, annexation seems so far away that its possibility need hardly be considered as affecting the interests of the present generation.

WHO SHALL HAVE THE WORLD'S CHIEF TRADE?

ENGLAND OR AMERICA, OR A LEAGUE OF BOTH?

"AMERICA'S Battle for Commercial Supremacy" is the title of an instructive and suggestive article in the November *Forum*, by Mr. John R. Procter. He asks at the outset, "Are not Anglo-Saxon freedom, law, and language destined to prevail in all lands where nature as provided the most suitable habitation for man?" He goes on to point out—by the help of a map of British fortified coaling and naval stations—that "it would seem that England is preparing either to fetter the commerce of the world, or to insure the good behaviour of mankind. Steadily she has acquired and fortified strategic points commanding the pathways of commerce." But he concludes that "England's warlike preparations are guarantees of peace rather than threats of war." The world's indebtedness to her in an amount estimated at £2,000,000,000 gives her the strongest interest in peace. He remarks with evident joy that "England's commerce with the sixty-five millions of people under the Stars and Stripes amounted to almost as much as her trade with the three hundred and eighty-six millions under the British flag."

AMERICAN AND BRITISH COAL AND IRON.

Mr. Procter then asks if the commercial supremacy of England is to be transferred to the United States, and thus puts points in answer:—

Of all the coal mined in the world, from the beginning of this century to the present time, that speck upon the ocean has produced quite one-half. Her output of coal still exceeds that of any other country. In 1891 she mined thirty-six per cent. of the world's product, while the United States produced thirty-three per cent. This country is increasing its output of coal at the rate of ten per cent. per annum, while the increase in Great Britain is less than two per cent. The cost of coal is increasing in Great Britain and decreasing in this country. England exports thirty-one per cent. of her total product of coal, while this country exports less than one per cent. of its product. This country will in the near future become a large exporter of coal.

Great Britain has for many years led all other countries in the production of pig-iron, producing, until of late years, more than one-half of all the pig-iron made in the world. Great Britain reached her maximum output of iron in 1882, and this country has doubled its production since that time, now producing more iron and steel than its competitor. In 1867, Great Britain produced fifty-two per cent. of all the iron made in the world, and the United States produced only fourteen per cent. In 1891, the United States turned out thirty-four per cent., and Great Britain only thirty per cent. of the world's product. The production of iron is increasing in this country faster than the increase in population.

England will, Mr. Procter believes, "probably for a longer time retain her hold upon the textile industry, which now furnishes about one-half of the total value of her exports." He rejoices that his people have "realised the folly of protection," and counts on their "advancing to absolute freedom of exchange."

A COUNTERPOISE TO BRITISH ADVANTAGES.

He grants that "our principal rival" has certain advantages, "not easily to be overcome":—

Her long established trade relations with all parts of the world; her trained and efficient consular service; her national Board of Trade, working in harmony with local boards and with her consular service and foreign merchants; her stable and consistent financial policy; her great superiority in merchant-marine.

"The ample protection given by British fleets to England's merchants trading with semi-civilised countries,

and the fact that her trained statesmen can give their time to the consideration of commercial, industrial, and financial questions," while American statesmen are occupied with the "spoils" system and other pernicious business, are classed as a "tremendous benefit." As a counterpoise is suggested the construction of a "ship-canal uniting the Atlantic and Pacific Oceans." This, it is urged, would make the United States "the workshop and clearing-house of the world," and could be done at a cost of less than the annual expenditure on pensions. Civil Service reform, free trade, and the canal would give the United States the balance of conditions in favour of industrial and commercial supremacy.

THE LEAGUED ENGLISH-SPEAKING PEOPLES.

Having made this statement, Mr. Procter passes abruptly, without any explicit transition, to the following weighty observations:—

Between England and the United States there is an increasing community of interest which is drawing these two countries into closer commercial and social relations. Is it unreasonable to hope that these interests and the ties of kinship will draw the English-speaking peoples of all lands into an Anglo-Saxon League that will insure peace and prosperity to all the world? While the continent of Europe is an armed camp, and millions of men in the prime of life are removed from productive industry to guard against imagined evils, or to gain petty and questionable advantages; and while the effective force of the people is dwarfed by the twin evils of Paternalism and Protection; the unfettered Anglo-Saxons, possessing the fairest and most productive lands, with dominion over the seas, owning ninety per cent. of the world's stores of coal, producing already seventy per cent. of all the iron and steel, ninety-five per cent. of the raw cotton, eighty per cent. of the tin, sixty-seven per cent. of the gold, forty-eight per cent. of the silver, fifty per cent. of the wool, thirty-six per cent. of the wheat, and producing more than one-half the manufactures of all kinds; controlling the short highways of commerce round the world—these peoples are entering upon an era of prosperity unexampled in human history.

Detective Pinkerton on "the Yellow-back."

A STUDY in a new class of crime by an expert in criminal research is supplied to the *North American Review* for November by Mr. William Pinkerton, of the famous detective agency, in his sketch of "Highwaymen of the Railroad." Train robbing, he says, has been "practised pretty steadily in the South and West during the last twenty years, but during the last few months outrages of this character have increased at an alarming rate." He remarks that train robbers "generally go in families—that is, there are usually two or three members of one family in the same gang." A more surprising fact is that "the majority of these robbers are recruited from among the grown boys or young men of small country towns." This extraordinary departure from supposed rural innocence is attributed by the detective-chief to the class of reading in which the rising rural population indulge.

One of the reasons for the recent epidemic of train robberies may be found in the general business depression. It is, however, also largely due, in my opinion, to the reading of yellow-covered novels. Country lads get their minds inflamed with this class of literature. Professional thieves or designing men find among this class many who are willing to go into their schemes. . . . They start in as amateurs under an experienced leader. They become infatuated with the work, and never give it up until arrested or killed.

The youth of these train robbers is often extreme. One was a lad of seventeen "who had seen a railway train for the first time" when he robbed it.

THE NEED OF AN ASIATIC DEPARTMENT.

SIR LEPEL GRIFFIN'S PLEA FOR OUR EASTERN EMPIRE.

"So far as England is concerned, the true Eastern Question of to-day is not in Europe, but in Asia." These words of Sir Lepel Griffin's sound the keynote of his vigorous and suggestive article in the *Nineteenth Century* for November on "England and France in Asia." He is deeply impressed with French hostility to Britain. "The hatred to the Germans is faint when compared with that which the French feel, and on every occasion proclaim, to England." "To conciliate France would be as easy as making friends with a rattlesnake." Sir Lepel is much exercised by the common belief that if France annexes Siam or other territories their trade will still be ours. The Franco-Russian hospitalities suggest that—

The time seems to have arrived for a reconsideration of our position, and to determine whether the policy of masterly inactivity should not be definitely abandoned in favour of an energetic defence of the national interests.

But even as matters now stand

The work of the Foreign Secretary is too heavy to be properly performed by one man . . . It would surely be expedient to relieve both the Foreign and Colonial Offices of a portion of their work, and to form an Asiatic Department under a separate Secretary of State, who should preferentially be an ex-Viceroy of India, and who would take charge of all questions relating to the East which were not more conveniently placed under the Secretary of State for India. . . .

The arrangement suggested is as follows:—

Under the new Secretary of State for the Asiatic Department would be an—Under Secretary for Persia, the Persian Gulf, and Aden; Under Secretary for China, with Corea and Hong Kong; Under Secretary for Japan; Under Secretary for Burmah, Indo-China, the Straits Settlements, and the islands, such as British North Borneo and British New Guinea. Under the Secretary of State for India:—The Viceroy of India—India, with Ceylon, Afghanistan, Biluchistan. . . . The principal change proposed in the Indian jurisdiction is to remove Burmah altogether from the control of the Viceroy. The country has no intimate connection with India.

"The disruption of the Persian Empire is more imminent than that of Turkey," and we need a strong diplomatic staff at Teheran. But

the most important political question in the Eastern world, which may more directly affect the fortunes of England than any other, and which is worthy of the best efforts of English statesmen, is the defensive alliance of England and China.

For both have good reasons to be apprehensive of the Franco-Russian Alliance.

Mr. Ruskin's Advice to Bible-readers.

THE November *Young Man* publishes two letters from Mr. Ruskin, sent in December, 1872 and 1873 respectively, to the president of a young men's Bible class in Aberdeen, which gives this terse advice:—

Say to them that they will find it well throughout life, never to trouble themselves about what they *ought* to do. The condemnation given from the judgment throne—most solemnly described—is all for the *undones* and not for the *donees*. People are perpetually afraid of doing wrong; but unless they are doing its reverse energetically, they do it all day long, and the degree does not matter.

My own constant cry to all Bible readers is a very simple one—Don't think that Nature (human or other) is corrupt; don't think that you yourself are cleft out of it; and don't think to serve God by praying instead of obeying.

PLEA FOR A QUINTUPLE ALLIANCE.

In the *National Review* for November Admiral Maxse discusses "The European Outlook." He regrets the intensity of French hatred for the English people. He deplors the aloofness of our Government in 1871, when the Germans were before Paris, and even Bismarck confessed he expected British mediation with a view to peace. That might have saved "the biggest blunder of the century"—the annexation of Alsace and Lorraine. He regards the Franco-Russian alliance as a *fait accompli*.

An immediate consequence of the *entente* has been that Russian and French chancelleries have been working together wherever there has been a conflict of French and English interests. If France can always rely upon Russia to support her when there is a difference between France and England, that is bad for England; and it is equally bad that in Russian and English disputes the former can rely upon French support.

Russian aggression will ultimately force us into war.

India will be threatened, and I take it that at this last ditch of our supremacy as an Oriental Power, we shall stand and employ the whole resources of the Empire to defend India from Russian invasion.

We have to consider whether we should not fortify ourselves by a counter-alliance. The question arises as to whether we should not now resort to the very formidable one which is doubtless available, viz., to a Quintuple Alliance, consisting of the present Triple Alliance plus England and Turkey, and, for that matter, Roumania, Bulgaria, and Sweden would readily form part of it. Such an alliance would secure European peace. France would have to accept the situation created by herself. Russia would be warned off Western Europe, and her Eastern projects would be arrested.

An Anglo-Italian alliance alone might have saved the necessity of such a precaution; but the time for that has passed.

The striking feature of the situation now is, as the result of this latest alliance, that England is the one isolated Great Power of Europe. A war might readily arise between England and the Double Alliance over one of the many disputes which are always open between England and France. . . . The Triple Alliance might watch with equanimity a war likely to exhaust and impoverish her enemies.

Red Snow.

"THREE thousand two hundred miles by foot and paddle" in the Canadian territory bordering on Alaska, is the subject of a series of papers which Dr. William Ogilvie begins in the September number of the *Canadian Magazine*. One passage describes and explains a curious natural phenomenon:—
